*NEW YORK, THURSDAY, JANUARY 7, 1875.*

## The Week.

THE events of the week in New Orleans have been chiefly military. On the appearance of the report of the Returning Board, it was telegraphed from Washington that the Attorney-General (who, according to one account, is the most partisan member of the Cabinet, and, according to another, has acted throughout at the dictation of the President) had determined upon "heroic treatment"; that General Emory was to be superseded, and General Sheridan put in command of the troops. This announcement was received with great dissatisfaction in New Orleans, General Sheridan having there the reputation of a good fighter and cavalry raider, but also of being essentially military, and not ranking high as a pacificator in his temper. On the 29th of last month, a Cabinet meeting was held, which is understood to have developed a decided feeling in favor of strong measures, and on the same day, R. H. Marr, Chairman of the Committee of Seventy, received at the Fifth Avenue Hotel a telegram from McEnery stating that all was quiet in New Orleans, and would continue so; and that he hoped to "control the organization of the House, unless prevented by United States troops." On the 3d of this month, it was discovered in New Orleans by the public that the arrest of one member of the House, and the non-appearance of three others (two of them sending word that, "not having been elected, they would decline to appear"), had upset the Republican majority in the House, and the day ended with wild and startling reports.

---

On Monday, the 4th, matters came to a crisis. Early in the morning, some eighteen hundred troops were placed in position near the State House, and the approaches guarded. At noon the legislature came in, over one hundred members being present, and began its work by making L. A. Wiltz, the Conservative candidate for Speaker, temporary chairman. Some parliamentary skirmishing then began, amid a good deal of disorder, and it was made plain that the Conservatives had a majority, one of the motions carried being to admit some contesting Conservatives to seats, when the Radicals began to withdraw from the House, and Wiltz and Ex-Governor Hahn were put in nomination for Speaker, the result being that Wiltz received 55 votes and Hahn 2. Wiltz was declared elected. The organization then went on, and a clerk was elected, the Radicals continuing to leave the House, and the sergeant-at-arms, under orders of the Speaker, preventing them as well as he could, or not at all, when General de Trobriand appeared suddenly on the scene with his staff and some documents from Kellogg, one of which, on being read by his adjutant, informed the House that it was an illegal body (this fact having been ascertained by him from a "petition" drawn up by the seceding Radicals), while another requested the General to turn out all those members who had not been returned by the Returning Board. This he accordingly proceeded to do, turning out eight or ten members at the point of the bayonet, the members selected being pointed out by General Campbell of the State Militia. General de Trobriand then proceeded to organize the House himself by having the roll called by the old clerk, bringing up a file of soldiers to help him, when the Conservatives, protesting, withdrew in a body from the House. On the same day General Sheridan issued an order announcing that he had taken command of the Department of the Gulf, and also telegraphed to the Secretary of War the existence in Louisiana of a "spirit of defiance," a great "insecurity of life," and "a standpoint which gives impunity to all who choose to indulge" in either defiance of law or murder, and a "general impotence on the part of the civil government"; this being followed on the next day by a second despatch announcing that the only way of restoring "confidence and fair dealing" is the passage of an act of Congress, or a Presidential proclamation, declaring the White League leaders "banditti," and their immediate trial by military commission.

---

Such are the actual facts of the most outrageous subversion of parliamentary government by military force yet attempted in this country. In a statement made by Wiltz, he says that in the organization of the House he carefully followed legislative precedents. But the precedents are a mere trifle. The gist of the outrage is that the legislature of an American State, the absolute, final judge—like every other legislature—of the qualifications of its members, having a legal quorum, in the very act of proceeding to the discharge of its duties, is turned neck and heels into the street by an armed body sent on from Washington for that express purpose, without a shadow of excuse, or even reason. We say without reason, for the pretence of Kellogg that the legislature was not organizing itself in a correct way, is a mere sham. The constitution of Louisiana does not make Kellogg judge of the organization of the legislature of that State any more than it does of the legislature of Massachusetts. We do not get, however, the full flavor of the outrage without recalling the fact that as, on the present occasion, the troops are called in to turn an adverse majority out, two years ago they were brought up for the opposite purpose of seating a favorable majority; and this time the members were turned out on the strength of returns on their face ridiculous, unfair, and fraudulent, while two years ago they were seated on the strength of a midnight order, illegal *on its face*, issued by a drunken United States judge; while Congress is still considering the question, What is the legal government of Louisiana?

---

The Louisiana and Mississippi investigations have been carried on during the week, and led to nothing. In Mississippi on the negro side nothing has been brought out, except what was very clear before, that the poor creatures were deluded into marching in an irregular, half-armed, moblike way on to Vicksburg at the orders of Crosby, under a vague impression that it was "Republican" to do so (according to one witness, who had been in command of the negroes, there was a story that General Grant and Governor Ames were both in Vicksburg in person), and were fired into and dispersed as any mob might have been, they having meanwhile been entirely deserted by Crosby. The New Orleans Committee have made no discoveries of importance, with the exception of the fact that the arrest of one of the Radical members of the legislature, whose absence is one of the facts which gives the Conservatives their present legal majority, was perfectly lawful, he having been arrested for embezzlement and not protected by his privilege.

---

The Pacific-Mail Sub-Committee, holding its meetings in this city, has examined a good many witnesses, and traced $115,000 into the hands of William S. King, formerly Postmaster of the House of Representatives, and member-elect of the next House; has discovered that R. C. Parsons (who admitted some time ago having received some of the money) had an account in Pacific-Mail stock in 1872 with Stockwell's brokers, and made thereby $1,185. In the investigation of last year, King swore positively that he had never received any of the Pacific Mail money; so that he seems to have committed at least perjury. John G. Schumaker, of Brooklyn, a member of the House, is proved to have received $275,000, and it seems likely that the committee have a good deal of very interesting testimony before them, as the accounts of the Company have been kept in such a way as to be much more convenient for purposes of covering fraudulent or improper transactions than for making its past history intelligible. In fact, entries to the amount of hundreds of thousands of dollars are a mere mass of falsehoods, which the witnesses frequently do not attempt to explain, except that they were made for "convenience" or "at Mr. Stockwell's request."

One of the most curious and illustrative incidents in the history of the Pacific Mail Company was the rise and fall of Mr. Stockwell, sometime President and factotum of the concern. He is the son-in-law of Howe, the sewing-machine inventor, and "being possessed of large means," as they say, determined, though without either education or acuteness, to distinguish himself as an operator in the stock market, and for this purpose, strange as it may seem, got himself made president of a steamboat company. While in this position, however, he paid no attention to the boats whatever, and gave his whole mind to the stock, and with such vigor that he impressed what is called "society" with the notion that he was the coming rich man. He accordingly was invited to all the balls, became a sort of leader of fashion, furnished the ladies and dancing-men with "points," and gradually rose to a very high eminence as a giver and receiver of "hospitalities," the ships of the company all the while going to the bottom at intervals. His operations, however, having all gone wrong, and having been more than once caught in his own "corners," society began to let him down with amusing facility. From "Commodore Stockwell," in which capacity he at one time attended "banquets," he became "Captain Stockwell," then plain "Stockwell," and finally Stockwell with an opprobrious epithet, and then disappeared altogether, to give place to other operators and "leaders of fashion." His career, in short, furnishes a remarkable exemplification both of the way the gambling spirit has destroyed legitimate commercial pride among a large body of our moneyed men, and of the way in which paltry adventurers can, with the assistance of the Stock Exchange, suddenly shoot up into positions which formerly were only won by long years of sagacious labor and self-denial.

---

The *Evening Post* is dissatisfied with our position touching the financial bill now pending, on the ground, as well as we can make out, that the practical thing to do in politics is, when you cannot get what you want, to make the best of what you *can* get; and that therefore the bill, though not what we want, is to be accepted, in spite of its imperfections, because it is all that we need look for either from the Republican or Democratic party. On the strength of this account of the situation, the *Post* considers itself entitled to accuse us of a want of practical common-sense, while "saying nothing of the *Nation's* particular criticisms of the bill." We do not well see what kind of politics this is. Our objections to the bill we consider fatal, and, this being the case, we do not know why we should accept it or tell people that it is acceptable. If there were a project on foot for building a bridge across a wide and rapid river, and commerce was in crying need of it, and the party in possession of the Government and the party in opposition were both hostile or indifferent to the scheme and reluctant to deal with it, and had no policy about it, and were trying all manner of tricks to avoid taking it up, and the Government party were some fine day suddenly to produce, for the satisfaction of the popular demand, a plan for crossing the stream on rafts drawn by kites, and were to declare that a raft was for practical purposes the same thing as a bridge, and would eventually by a process of evolution grow into a bridge, and that kites were a magnificent instrument of traction, and that, anyhow, a raft was the only thing they could get through Congress, and that all the opposition would propose was a raft drawn by spaniels—and the *Nation* were to maintain that this was a wretched attempt at imposition, and that no such plan ought to be accepted, and that public opinion ought to be worked on until either one party or the other were forced into a rational policy, we suppose the *Evening Post* would come down and say: "Politics is an art in which compromise is often of the highest value, and in which it is a good rule, when you cannot have all you seek, to accept what you can have. But here is the *Nation*, while acknowledging that neither the party in power nor the party in opposition desires to build a bridge, and that all that either will supply is a raft, growling and complaining, and denouncing rafts as humbugs, and saying that they will not carry goods or passengers safely, and that kites and spaniels cannot draw them, and that no raft was ever known to grow into a bridge. We shall not notice these objections to rafts in detail; we shall simply say that this querulous spirit is very foolish, and that rafts drawn by kites are, at all events, a compromise between crossing on a good stone or iron bridge and not crossing at all."

---

The ground on which the *Post* supports the bill, and Mr. Schurz we believe, voted for it, is that it contains a promise of resumption on a day certain. At first, we were inclined to support it on this ground ourselves, but further consideration satisfied us that this promise was farcical and was not meant to be kept. The greenback currency cannot be contracted under the bill without increasing the national-bank currrency, which is sure to cheapen all paper-money, or, in other words, raise the premium on gold, and increase the popular dread of resumption; and the probability is strong that there will be no additions made to the national-bank notes sufficient to produce a sensible contraction of the greenbacks. It seems also to be now all but certain, and Senator Sherman's evasion lends support to the supposition, that it was the secret design of the caucus that even the greenbacks withdrawn on the issue of the national-bank notes might be reissued at the pleasure of the Government, or, in other words, that this part of the bill is a deliberate attempt to commit a paltry fraud, in order to secure the acquiescence of ignorant barbarians like Logan. So that to treat the measure as a promise to resume requires an amount of hopefulness that may be fairly called childish. It may be likened to the promise of a debtor, who had twenty thousand dollars a year and no more, and lives at that rate, to take up his outstanding notes in four years, while expressly refusing either to cut down his expenses, to increase his income, or to bind himself not to issue more paper. His promise, made under these conditions, might possibly seem to some people better than nothing, but no prudent creditor would base any business transaction on it.

---

At a dinner given to Carl Schurz by the "Bird Club" of Boston, last Saturday, Mr. Schurz stated his belief that no political party has now a well-defined policy that unites its members; that both Republicans and Democrats are casting about in the dark to see what they can agree upon on the most important subject of all—the financial policy of the nation; that unequal as the recent finance bill is to the wants of the country, he feared that the Democrats could not be relied upon to furnish a better one; and that he had striven to form a new party, because of his conviction that no party in existence would treat the really great questions before the country upon their merits. Immediately after these plain statements, Mr. Tarbox, one of the new Democratic Congressmen-elect from Massachusetts, thought it would be the wisest policy for the Democrats of the West "to join in the return of Mr. Schurz to the Senate," and said he should mourn "when political partisanship shall put out the light which shines so brilliantly in the United States Senate in the person of the distinguished guest of this occasion." Other Democrats as well as Republicans made equally complimentary references to Mr. Schurz, and when Mr. E. L. Pierce closed his speech by saying that if Mr. Schurz was a resident of Massachusetts he would receive at least one vote as Charles Sumner's successor in the Senate, the remark, in the language of one of the Boston papers, "was immensely applauded." How far these expressions were the results of a good dinner, and how far they came from a real perception of the condition of parties by prominent Massachusetts politicians, it may not be easy to decide. It is worthy of mention, however, that when Mr. Tarbox expressed his hope that the Missouri Democrats would return Mr. Schurz to the Senate, he felt obliged to add that he did not suppose they would do it.

---

Through the whole of November, the probability of a restoration of the Spanish monarchy in the person of Prince Alfonso, the late Queen's son, in whose favor she abdicated, was a common

topic of conversation in Madrid, and his adherents were very confident that it was coming. Some of the military performances of the Government were so mysterious as to lend color to it. Towards the middle of November, General Laserna landed at San Sebastian with about 5,000 men, who marched under General Loma to the relief of Irun, a little town on the French frontier then closely pressed, and attacked and completely defeated the Carlists. It was expected that this success would have been vigorously followed up; but, far from this, Laserna suddenly received orders from Madrid to re-embark and get down on the Ebro, which he did, leaving Irun once more exposed to the enemy. What this meant nobody could tell. On the one hand, a decisive success seemed necessary to the support of Serrano's position; on the other hand, it might be that Serrano did not want anybody but himself to achieve it, and this even was strengthened by the rumor that Serrano was going to leave Madrid with a powerful force, which he was to command against the Carlists in person, and with a considerable sum of money, with which it was said he was going to buy up the principal Carlist officers, and so in one way and another end the war. About the middle of December he did start for the north with a small reinforcement and over $2,000,000, which he had borrowed through the Rothschilds, who probably knew when they advanced it that the Marshal was not merely going to try his luck in the field, and the Alfonsists stoutly maintained both in Paris and Madrid that the thing was all arranged, and that as soon as he reached the army he would "pronounce" for Alfonso.

---

The movement was begun by General Martinez Campos, Spanish fashion, with *two* battalions of soldiers. The "Army of the Centre" was drawn off from the pursuit of the Carlists to march against him, and when it got near him, Spanish fashion, joined him. The other armies and the navy followed, and the now celebrated iron-clad, *Numancia*, went to Marseilles to bring Alfonso home. He, on his part, makes the usual declarations—that he is liberal and constitutional, and will be the king of the nation and not of a party, and so on. His accession leaves the political situation practically unchanged. He is too young and inexperienced, and possesses too little character, to take the government out of the hands of the military chiefs, who will carry it on, as they have long done, by a system of intrigues and counter-intrigues, varied by abortive attempts at revolution. This termination of the revolution of 1868 was tolerably apparent from the refusal of Serrano to convene the Cortes, or to give in his adhesion to any form of government in particular, and his failure to put down the Carlists. In Spain, delay always works in favor of some monarchical pretender. The general result probably has surprised few intelligent observers. Readers of this journal will remember that we have prepared them for it from the very first day, and warned them assiduously against the notion, which some of our contemporaries preached, that the dethronement of Isabella meant the commencement of a new era in Spain. There was not the shadow of reason for holding any such view. A radical change for the better in Spanish politics will be the result of a protracted educational process of some kind; no such process had taken place under Isabella. There was, therefore, no ground for believing that something better would succeed her. Catholic Spain was the product of many centuries of Moorish Spain; anarchical Spain is the product of three centuries of priest-ridden, absolutist Spain. Supposing that such a country can be suddenly converted into an orderly republic by changing the name of the government, is one of those things which will before many years amuse people as much as attempts to foretell future events by examining the entrails of a hen.

---

The two Centres of the French Assembly from whose agreement in policy much was expected have not agreed, but differed about the Constitutional questions—the Left desiring to have them all taken up together, and the Right being desirous of having the question of a Second Chamber dealt with separately. The Extreme Left, on the other hand, goes in for a dissolution pure and simple, and an appeal to the country. Marshal MacMahon, who, since his tour in the provinces, has shown a desire to rely on "moderate men of all parties," has had a conference with representatives from each in the hope of reaching some position on which all could stand, but without success. A semi-official account of it acknowledges that nothing definite was accomplished by it, though it may, it is to be hoped, remove some misunderstandings. The probabilities are that the Government will press the whole of the Constitutional bills, under threat of a dissolution in case they are not put through, though whether it could command a dissolution even with the assistance of the Left is more than doubtful.

---

Apart from this organic legislation, the Assembly has been occupied for some weeks with a measure proposing to establish "liberty of instruction," or, in other words, to permit the establishment of other universities besides the state one—which, strange as it may appear, is supported by the church through Bishop Dupanloup, and opposed by the extreme Radicals through M. Challemel-Lacour, the Radicals believing, and rightly, that in the matter of setting up independent colleges the church would beat them out-and-out; a measure to establish liberty of public worship, or, in other words, liberty of holding religious meetings without belonging to one of the denominations recognized by the state, and without being licensed by the police, which was introduced by M. Pressensé, the minister of the Reformed Church, in the interest of the rationalistic schismatics in that body; and a measure putting the press on a better and more liberal footing. The Government offers no opposition to the two former bills, and has introduced the last; but it is difficult to see how any radical change in the legal condition of the French press can take place as long as the French public is so inflammable. What renders liberty of the press, as we understand it, possible in the United States and in England is the phlegm which leads the public "not to mind what the papers say"—or rather, to mind it only very slowly, and after much deliberation. If, for instance, it was possible for the "intellectual department" of the *Herald* to endanger the existence of the Government, or even the public peace, by one or more "sensational articles," liberty of the press would rapidly disappear in the United States. The press is enslaved in France largely because Frenchmen are so constituted that any lively young Bohemian or lampooner has it in his power, by a few days of "ink-slinging," to get the garrison of Paris kept under arms and to send the rentes down, and cause a flight of strangers from the capital.

---

In England, the main subject of discussion is the one taken up by our correspondent in another column—the probability that Mr. Disraeli may have to retire from public life. There has been some more skirmishing over Bishop Colenso, who has been again inhibited from preaching, this time by the Bishop of London, and there are all sorts of rumors of further trouble on the Papal question, Archbishop Manning threatening vengeance on the insubordinate Catholics, and they in their turn announcing that they are ready for him. But the Old-Catholic movement, which, if strong, would be the best support of the latter, does not prosper anywhere, and the reason is obvious enough, and has often been pointed out in these columns, and that is, that dissidents and schismatics in our day do not care enough about the matter to proclaim their dissent publicly and set up a new church. When they are dissatisfied with the Pope or the bishops, far from nailing theses about them on the church-door, or offering to go to the stake for their opinions, they simply stay at home on Sundays, or take a walk in the country, and smile when infallibility is mentioned. There is, therefore, not much likelihood that Döllinger and Hyacinthe will ever have a powerful following in public.

## SUBSIDIES.

THE vote recently taken in the House of Representatives on the lending of Government credit in aid of private enterprises probably indicates pretty decisively the fate of the Pacific Mail and other subsidy schemes for the winter. There are only two short months left Congress, now that the holidays are over, in which to legislate; and even in the recklessness and haste of the last days of the session, it will be hardly possible for the most irresponsible member of the enormous majority which voted in favor of the resolution to forget his pledge. The President, it is true, has in his message recommended subsidies to American vessels carrying mails; but it is not necessary to suppose that he is bent on securing this. The lesson of Johnson's failure in administration has not been without its effect on General Grant's mind, and ever since he came into power he has acted on the "no policy opposed to that of Congress" theory with a good deal of consistency—always excepting cases in which he took some lively personal interest, as in that of San Domingo. He has been in favor of civil-service reform, but, apparently becoming convinced that Congress has not set its heart on this measure of purification, he now declares that he has no desire to insist on it, and that if Congress gives it up he will give it up too. Last year, or the year before, he investigated the Western Transportation question, and came to the conclusion that it was of such great importance that it ought to be investigated by the Senate; this year, although it is certainly of just as much importance as before, he seems to have very nearly forgotten its existence, and directs the attention of Congress to the development of American shipbuilding by means of subsidies. Judging of the future by the past, it seems very doubtful whether he will exhibit any deep degree of interest in this recommendation. Besides this, the Administration, like every other branch of the existing Government, is on its good behavior; and, in the present condition of the finances and business, economy, or the appearance of it, is a necessary part of good behavior. The desire of a reputation for economy both on the part of the Administration and the Republican majority of Congress, together with the hostile attitude of the press and public opinion, will make the passage of subsidies, at the present session, a difficult matter; and what these causes will not effect will very likely be accomplished by the very remarkable history of the Pacific Mail Company, in connection with its present application.

Indeed, those who are accustomed to look for and recognize in the tangled maze of human affairs the hand of a superior Power, might fairly find in the present condition of Pacific Mail a heaven-sent warning against the intermeddling of Government with private schemes of any kind. Not many years ago, this company was in an extremely flourishing condition; its stock was among the highest quoted in the market; its management was conservative and successful; its future was promising. In an evil hour, it determined to go to Washington and secure from the Government a subsidy. It went and succeeded. From that time to this it has been a subsidized line; and what are the results? Nine of its ships are lost; its stock is quoted at 34; its management changes from year to year and almost from month to month; it has sent to the bottom as many American-built reputations as it has vessels; and, having totally failed to comply with the engagements entered into in consideration of its last subsidy, it now comes, bankrupt, crawling into Congress, begging that money may be given it on the ground of the good faith with which it has endeavored to carry out its promises, while Congress is at the very moment instituting an enquiry to discover whether this same subsidy was not obtained by fraud and corruption. The evidence of Irwin, taken by the Committee of Ways and Means, though it should not disclose what became of the $750,000 paid by the Company to procure the subsidy, throws a very strong light on the effect of subsidizing on the management of the line. There is a general impression in people's minds that infamous contracts are usually entered into with some circumspection, and seldom committed to writing. We do not remember that in the history of the Erie Railroad, even, it was a common thing for Fisk to sign his name to paper promising to pay a round sum on the signature of bills or the service of injunctions. In the Crédit-Mobilier investigation it proved difficult to get to a higher level in the evidence than that of private memoranda; and it is in the Pacific-Mail case that we have for the first time the production by a witness of a written promise to pay a sum of money to himself as an agent sent to Washington for the purpose, not for "services," or for "legal expenses," but for the *passage of a bill by Congress.*

These facts, which have now become public property, are likely to prove a serious obstacle in the way of subsidies at the present session of Congress. But the history of Pacific Mail is very like the history of a good many other attempts, both at Washington and in the various States, to foster private enterprise for public ends. In almost every State there is some well-known railroad, steamboat, canal, or bank which has been tenderly nursed by the public at the public's expense into a forced, unhealthy activity, and which has ended in ruined credit, lost reputations, and more brazen appeals for assistance from the bankrupt outcast. So common has this been that the greater number of the State governments have put an end to the possibility of such appeals by changes in their fundamental law. There are, however, a number of people who are persuaded that the disasters which have always attended subsidies and other forms of Governmental aid in the United States have come from accidental causes, and might with care be prevented; and every winter they return to the task of demonstrating to Congress that the particular disasters and frauds of one scheme were due to accidental defects in the law, or in the character of the men, or in the nature of the enterprise, and therefore need not be expected to occur again. People who maintain this line of argument usually point to the example of the encouragement of private enterprise by European governments, and ask why, if, under proper safeguards, it works on one side of the Atlantic, it may not work on the other?

The answer to this question goes to the root of the matter, and really constitutes a fundamental reason why subsidies are not likely to succeed in the United States under existing conditions. The reason may be stated very simply. The one thing necessary to a successful expenditure of public money by way of subsidy is continuity and fixity of administration. This European governments have; this, at present, we have not. In most European governments the officials who have charge of the expenditure of public money remain in office for a sufficiently long time to supervise and control, from the beginning to the end, the expenditures. They have been familiar for years with matters of the kind, and have only one object—to see that the government aid is properly administered; while the company or individual subsidized knows very well that it is dealing with a hard and watchful employer, who will cut it adrift unless it performs the contract to the letter. In this country, on the other hand, there is nothing of the sort. Instead of there being any fixity of administration, the administration is perpetually changing from top to bottom. Since the Pacific Mail went to Washington there have been in the two places requiring the most permanence—if subsidies are to be tried at all—not less than four heads of departments: in the Treasury, Mr. McCulloch, Mr. Boutwell, Mr. Richardson, and Mr. Bristow; in the Attorney-General's office, Mr. Evarts, Mr. Hoar, Mr. Ackerman, and Mr. Williams. We might say the same thing of the Pacific Railroad, from which the Government is now engaged in an attempt to recover the subsidy given, on the ground of fraud.

Nobody can doubt that, if the expenditure of the money in both these cases had been watched as it ought to have been, the scandals which have ensued would have been avoided. But this is impossible when the persons who protect the legal and fiscal interests of the Government and their host of subordinates hold their offices with little more fixity of tenure than the members of a State legislature. The consequence is that all supervision becomes a sham. In the Crédit-Mobilier case the Government directors were of no use; in the Pacific-Mail case the inspection provided by law has apparently never been of any avail; in the Hartford-and-Erie case, in

Massachusetts, the representatives of the State were legislated out of office, for the very reason that they were protecting the interests of the State.

The usual process is this: The Government promises, in consideration of certain services to be performed, to undertake certain expenditures, and at the same time makes careful provision for the appointment of a number of discreet persons to see that the money is not paid except for services rendered. Then the game begins. Very soon the company discovers that these checks are in the way; that it needs money faster, or that it is inconvenient to perform the services. They then remember that, fortunately for them, fixed tenure of office is unknown in the United States; that a little of the same influence which got them a place at the public crib in the first instance will keep them there, and they make use of it. A new man is appointed here, and an old one threatened with removal there, and the money soon comes pouring out. And so it will be to the end of time. An official who, like all our officials, may be turned out of office at any moment, and whose retention in office depends on his pleasing, not his superior, but a number of outside interests which can get him out of office, will never be an efficient guardian of Government bonuses to private enterprises. What is the alternative? Nothing but this—to give up subsidies.

## THE CONDITION OF THE DISTRICT OF COLUMBIA.

IT is just two years since Mr. Dawes, on the floor of the House of Representatives, opposed enquiry into the affairs of the District of Columbia because it would cost too much. Since then there has been an investigation, which has cost a great deal more than even the political and economic fears of Mr. Dawes could have anticipated. What the real cost of the investigation has been in national reputation, in the exposure of personal malfeasance, in diminished confidence in public men, and in changes of political power, it is not worth while now to sum up; it is enough to say that the dollars and cents which the work of investigating may have drawn from the Treasury seem in comparison so inconsiderable that no one ever gives them a thought. Certainly, at this time objecting to such an investigation because of its cost seems about as sagacious as to object to the punishment of criminals because jails are not profitable. Certainly, at that time no community ever had a juster right to demand an investigation. Public improvements had been projected in a month or two and pushed forward with a haste and audacity and reckless disregard of cost that savored more of ancient despotism than of modern civilization. A community of only one hundred and thirty thousand persons found themselves in a single year involved in improvements which were to cost twenty millions of dollars. The board that was hurrying along this work the community did not create, its members they did not select, and over its plans and projects they could exercise no supervision. Conceding that the work was justifiable and judicious and wise, still the very magnitude of the undertaking made it always a proper subject for investigation; and the community liable to pay for it, being without power to revise or investigate, had a moral right at any time to invoke the scrutiny of Congress.

During the past year the District of Columbia has played a more important part in national affairs than it has done in all the preceding years since its establishment. Heretofore the people of the United States have strangely looked upon the improvement and welfare of their seat of government as the local affair of an ordinary town. But during the year 1874 the local wrongs of the people of the District have become national, and the inhabitants of Western towns or New England villages have resented these wrongs almost as vigorously as though they were directly their own. A sense of responsibility has taken the place of the old indifference. And this change is not popular caprice, but on the contrary a sound deduction from the facts which Congress and Governor Shepherd have succeeded in laying before the eyes of the American people. What are these facts? (1) A board created by Congress and appointed by the President, which in a year or two places an average debt of nearly eight hundred dollars on the shoulders of every family, and in effect mortgages every man's house often to an amount exceeding its value. (2) The arbitrary funding of this debt, largely illegal, by Congress, turning it into the bonds of the District. (3) The establishment of a temporary municipal government, in which three commissioners are vested with all the powers that lie in the mayor and common council of ordinary cities. Conceive of Congress suddenly abolishing the city government of St. Louis and putting all of the corporate interests of that town into the hands of three commissioners, actual residents of Maine, Massachusetts, and Arkansas. The direct exercise of power is the express acknowledgment of responsibility. The fact that such an interference by Congress is an absolute impossibility for St. Louis while it is the actual condition of Washington, illustrates clearly enough the legal difference between an ordinary town and the national capital.

If New York had been retained as the capital, the presence of the Government might have hindered, but could not have helped, her extraordinary growth. At most, we should now be having a few additional hotels, a few additional acres in parks and squares, not more than half-a-dozen showy public buildings, and not more than five per cent. increase of population. The Government would be a mere boarder and lodger, having little more to do with the management of the town than the philanthropic conventions which are accustomed to assemble here in the month of May. On the other hand, the city would be exercising a powerful influence upon the Government, and especially upon Congress. Members living here for months and years would be drawn insensibly into the rapid currents of commercial thought, and gradually reach the conclusion that what affects the commerce of the metropolis, favorably or unfavorably, affects in like manner every portion of the country. It is not probable that any one would now be saying "New York is America," yet it is more than probable that the United States would now be a "free-trade country," commercial in its policy, and possessing the largest merchant marine in the world. The old slaveholders' violence, which so long disgraced because it intimidated Congress, would never have ventured into expression; and the slave problem might long ago have found a peaceful and therefore better solution. That there might have been deleterious influences overbalancing these advantages no one will deny, but few will now affirm that any great danger could be threatening the Republic because its capital was placed, like the capitals of all European countries, in its chief city. Be the wisdom of the theory that planned our seat of government as it may, two things are today tolerably certain: first, that no great American city will surrender itself to the absolute control of Congress for the sake of being the national capital; second, that the conflicting authority of our State and Federal system requires, in public estimation, that the capital be under the exclusive jurisdiction of the Federal power.

It follows almost inevitably that the seat of the national Government must be not only the creation of the Government, but also under its abiding guardianship. A control which is able to destroy corporate and private rights is morally chargeable with the growth, improvement, and security of the capital. It does not do to say one day that the Government may bind all private and public property in the city as it pleases, and the next that it may surrender a matter of national concern to the exclusive management of a small, local body-politic. An ordinary self-controlled city is subject to the ordinary laws of growth and progress, and its exclusive end is the welfare and convenience of its permanent inhabitants. Washington was never designed to serve any such humble purpose. On the contrary, all of the purposes which called it into existence and dictated its plan and dimensions were national. Its streets, by way of illustration, were not laid out according to the necessities of traffic, nor limited by the economic views of its inhabitants. Instead of such business ways, its founders provided avenues of magnificent proportions, intended from the outset to please not the local taxpayer, but the American citizen, and to be commensurate not with the local wants of a small town, but with its national purposes. Thus

fifty-four per cent. of its area was given up to streets and squares, against twenty-five per cent. in Paris, and twenty-six per cent. in Boston, and thirty-five per cent. in Vienna, the latter being, in this regard, the most extravagant of European cities.

The result of the "District investigation" is a bill before Congress. Under the old city system, the inhabitants appointed their own municipal agents, and were free to devote as little or as much to city purposes as they pleased. As a whole, they had a smaller interest in the improvement of the place than the community of any other town in the world, and, as a consequence, they left Washington so unkept and uncared for that most people who saw it spoke of the national capital as a shame and a disgrace. Under the late Territorial system, the people of the District continued to have a nominal control over taxation; but, inasmuch as a certain well-known Board of Public Works appointed by the President had power to control the voting element and run the District in debt, the reserved right of the people to tax themselves through their Territorial representatives was not a privilege worth shedding one's blood for. Under the system proposed now, all semblance of local government will be swept away, and the national capital will be managed directly by the agents of the Federal Government. Taxation will remain, but it will be within the discretion of Congress and not of the taxpayers; while the amount levied will go directly into the United States Treasury, in the nature of a contribution, and without regard to the amount expended. The Government will manage the city and pay for it, and Congress will levy from the inhabitants such contribution as in its discretion shall seem just; but the contribution will not control the expenditure, nor must the expenditure equal the contribution. The sovereign discretion of Congress, therefore, takes the place of self-government, and the city passes out of the list of free communities, and must be ranked among those which are governed by a power beyond their own control. It passes with the approval of the taxpaying part of the people, and, indeed, the only protest is that raised by Mr. Morton, ostensibly on behalf of the colored voters, but really in the interest of the irresponsible laborers who have been the effective weapon of the Board of Public Works. That the "free-city system" thus falls with the assent of those most concerned to retain it, confesses the failure of corporate governments based on the suffrages of those who are not the true incorporators. An experiment of city management resting on the suffrages of those who own it might have been tried in Washington which would have been of incalculable benefit to the country.

## ENGLAND.—THE NEXT CONSERVATIVE LEADER.

London, Dec., 1874.

THE chief political interest at the present moment is concentrated on the questions whether Mr. Disraeli will meet Parliament as Prime Minister, and what will happen if he does not. The former is not perhaps a political question, but a medical one. No one doubts that Mr. Disraeli will not resign unless his health compels him. But the story goes that his health will compel him. He has, no doubt, been seriously ill for some months. It is true that he is only sixty-nine, and sixty-nine is no age for an English public man. After our experience of Lord Palmerston and Lord Russell, we have got to think from seventy to seventy-five the prime of life for a statesman, and Mr. Disraeli has always been a young man of his age. He is one of those who take the labors and worries of life easily, and from being so much in opposition he has not had much really laborious work to do, and of what he has had to do, it is commonly supposed that a good deal has been done for him. It might fairly have been expected, therefore, that his constitution would stand at least as long as his government. However, he has certainly had a severe attack of gout, and sixty-nine, though it may be young for a statesman, is somewhat old for a human being. He is said to have got considerably better lately, and it is quite possible that he will be able to go on for another session at least. On the other hand, it is quite possible that he will resign within the next six weeks—and what then? Of course everybody knows that there are two branches of the Conservative party—the old Tories, who want at least to stand still at all hazards, and would go backwards if they could, and the moderate Conservatives, who, though they do not want to move forward, do not much object to being pushed, and hold that if changes are to be made it is better, in the interests of conservatism, that Conservatives should have the making of them. An English newspaper compares these two parties to the Legitimists and Orleanists in France, and there is a certain amount of similarity in their respective positions; but, from the difference in the character and habits of Frenchmen and Englishmen, there is little real analogy between the two—indeed, like most comparisons between English and French politics, its apparent plausibility only makes it the more misleading. The Legitimists distinctly prefer no bread to half a loaf; they are continually having "rapprochements" with the Orleanists, but never reach any real union or compromise; while the Tories, with occasional individual exceptions, always act in harmony with the modern Conservatives when it comes to the point, though they often grumble a good deal at having to do it.

Mr. Disraeli, who has as little of the genuine Tory about him as any man in England, has of late got complete command of the party, and has led them—somewhat too fast, as many people think—in the ways of Liberal-Conservatism. They did not like him, and members of the country-gentleman stamp do not even now quite understand how it was that, being Conservatives, they yet, in 1867, enacted an extension of the suffrage wider than had ever before been thought practicable, even by Liberals. But his skill as a leader made him indispensable to them, and so, as they were Englishmen and not Frenchmen, they accepted the indispensable. After the brilliant results of the last elections, there can be no doubt that he will continue, as long as his party remains in office, to be Prime Minister and leader of the House of Commons, if his health remains sufficiently good; but if his health compels him to resign, who is to succeed him in these functions? As to the House of Commons, there is no difficulty. The Tories there, though numerically strong, have no very prominent representative. Mr. Hardy, though perhaps he should be classed as a Liberal-Conservative, yet agrees with the Tories on many points, and is quite trusted by them. He is an able though not a very brilliant man, and the Tories like him the better for his want of brilliancy. He is popular, too, with both sides of the House, and could manage matters with tact and dignity. He unquestionably would lead the House of Commons.

He would, however, not be likely to be Prime Minister yet awhile, at all events. For that office there are three possible candidates, all peers—Lord Salisbury, Lord Derby, and the Duke of Richmond. Lord Salisbury is generally thought to be one of the ablest of all our public men. He is a brilliant debater and excellent administrator. He is, however, impetuous, proud, and difficult to get on with. Above all, he is one of the most bigoted of Tories. In 1867, he resigned office because he would have nothing to do with passing a Reform Bill—a step which gave him great prestige with all the Tory section; and his personal dislike to Mr. Disraeli was so great that it was with difficulty he was persuaded to join his Government last spring. He yielded at last to pressure, public and private; but there have been serious disagreements in the Cabinet, at least so it is said, between his party and the more liberal members of the Government, and though matters are supposed to be patched up for the present, and he continues to serve under Mr. Disraeli's leadership, yet, if there were to be a reconstruction of the Cabinet, it is by no means certain that he would consent to act under any of Mr. Disraeli's followers.

Lord Derby is the Liberal-Conservative candidate. He is by birth and position a Conservative, but by temperament a Liberal. As Mr. Disraeli is by nature a Radical who by accident is Conservative leader, so Lord Derby, though ostensibly a Conservative, is by nature a cold, sensible, cautious Whig. He is not an orator, yet no man is more listened to. He has little enthusiasm, but is the incarnation of sense. He has few intimate friends, but as a public man no one is more trusted. He is the natural successor to Mr. Disraeli, and it is probable that, if the latter resigned, the Queen would in the first instance ask Lord Derby to form a Government. Whether he could do so would, to a great extent, depend on whether Lord Salisbury chose to let him.

The Duke of Richmond is the present leader of the House of Lords. He is a moderate Tory of fair abilities. His position as a statesman is narrow, neither very definite nor very distinguished, and his abilities are of a dullish kind. He is leader of the House of Lords because, between the conflicting claims of Lord Salisbury and Lord Derby, it was thought advisable to get a duke to be the nominal chief over both, and among dukes he was the best. Similar reasons are not unlikely to make him the next Prime Minister.

Such are the candidates. It is to be hoped that there will be no necessity yet awhile to select between them. One point every one, hardly even excepting the members of the late Government, is agreed on, namely, that matters are very well as they are. If, however, a Prime Minister has to be

found, it is to be hoped Lord Derby will be the man. If it were to be the Duke of Richmond or, still worse, Lord Salisbury, we should be in danger of a Tory Government, which only a very small fraction of the nation wish for. The attitude of the country is Liberal-Conservative exactly. Content, on the whole, with what has been done, they want time to look round them and put a few administrative matters straight before entering on more changes. They don't want to be bothered to go on, but still less do they want to go back. Asking them to take a retrograde step, such as a Government under Lord Salisbury's inspiration might wish to take in educational and ecclesiastical matters, would be like asking a man who sat down because he was tired, to walk back half a mile by way of resting himself. He would say, "If I can't sit quiet, I will walk on"; and so should we say—and the result would be a Liberal Government, coming in on the promise of doing something, and, to redeem its promise, setting to work to pull down a lot of things which, for the present at all events, are much better left alone.

If Mr. Disraeli goes on, things at present look like a quiet session. There is, indeed, a theological or rather ecclesiastical rock ahead in the shape of the Bill for Church Government, which was foreshadowed last session. But no one really wants to meddle much with this. It is a thorny subject, on which public opinion is difficult to gauge, and party votes are not to be depended on. The Government has given pledges on the subject, and something must be done to redeem them; but if Mr. Disraeli is Prime Minister that something will not be much. We shall have a legal and sanitary session, which may be useful but will not be amusing.

## THE FRENCH VIEW OF THE ARNIM TRIAL.

PARIS, Dec. 18, 1874.

THE whole interest of the day is in the Arnim trial and the despatches which have been published on occasion of it. It is impossible to speak, impossible to think, of anything else. Arnim's and Bismarck's names are in everybody's mouth. It is not often that a nation acts after the old Greek precept, Know thyself; but France has perhaps less than any other country the faculty of subjective examination; she does not much look at herself, and prefers to be looked at. German diplomats now present to her a mirror in which she can contemplate herself, or rather an image of her which was drawn without her knowledge.

One thing strikes me more than any other in the observations which I have heard on all sides since the beginning of the trial: there is very little anger felt towards either Arnim or Bismarck. These two men wrote to each other, they spoke their own thoughts, and they had no intention of insulting the French people. At the very height of their triumph, they seem chiefly preoccupied with one idea: What can make France more incapable of regaining her past power and prestige, how are we best defended against her? Arnim is the more generous of the two correspondents. In some of his letters he indulged in very sharp criticisms of the French, but on his trial he publicly expressed his regret at having done so. What, however, still better proves his superior generosity, is the fact that he was not quite unwilling that France should have a decent government, well established, and with some guarantees of permanence. The despatches of Arnim are very interesting for a moralist; he has, so to speak, a double soul, a good and an evil genius. When, for instance, speaking of the terms of payment of the ransom, he says, "I have exacted fortnightly payments, because this will give us more opportunities of complaining," the evil genius speaks; the good genius speaks in other places, which have a philosophical and sometimes almost artistic character. There is less subtlety and less art in Bismarck's utterances; he does not try to conceal his hatred of the French nation. Take this phrase, for instance: "If France should represent again before Europe a second act of the interrupted drama of the Commune (a thing which I do not desire for humanity's sake), it would contribute to make the Germans appreciate more fully the benefits of a monarchical constitution." I shuddered when I read the parenthesis—it is only for humanity's sake, not for the sake of France, that Prince Bismarck does not desire the return of the Commune; which implies that he would almost desire it for France. This addition "par humanité" is quite in the spirit of the whole despatch, in which he proves mathematically that Germany must favor the Republican solution in France, because the Republic in France means anarchy, isolation in Europe, and weakness. He scolds Arnim like a schoolmaster; blames him for his generosity, and says to him: "I am sure that no Frenchman would ever think of helping you to reconquer the benefits of a monarchy if God threw upon us the miseries of a republican anarchy. It is an eminently German quality this show of interest in the fate of a neighboring enemy."

Bismarck, as you see, is fortifying his own soul against German weakness and generosity, and he tries also to put the "æs triplex" round Arnim's heart. But Arnim, as is well shown in the despatches, did not believe in Thiers; his portrait of him is a masterpiece, when he paints him getting up seventeen times in a discussion, always "infallible in the things of which he is ignorant." Arnim's previsions proved to be the right ones; Bismarck believed that Thiers would be stronger than the Assembly—the Assembly was stronger than Thiers. When Arnim heard of the vote of the 24th May, he could not conceal his sentiments. "Well," said he, "there is some hope left for France!" He triumphed too much, and Bismarck would not forgive him for it. The restoration of the French monarchy became all the more odious to him since Arnim had prophesied it and desired it. Bismarck knew that it was always in the power of Arnim to make an appeal to the monarchical feelings of the Emperor of Germany; he had enemies on the very steps of the throne. The Emperor of Russia had never affected any love for the French Republicans. It is quite clear that after the 24th of May last a struggle of influence began between the German Chancellor and the German Ambassador in Paris. This struggle was not confined to the French question. Arnim placed himself at the head of the party which did not approve the anti-Catholic policy of Bismarck. He did not believe that dogmas can be attacked simply with laws; his despatches from Rome at the time of the Vatican Council showed him to be an enemy of the Papal infallibility, but at the same time he wished to attack the Papacy with spiritual as well as with temporal arms. He imagined that the Falk laws, which resulted in the imprisonment of Catholic bishops in Germany, the closing of seminaries, and other violent measures, were a real danger to the newly-established unity. Bavaria, Würtemberg, the Rhenish Provinces, Alsace, formed a sort of Catholic league. These views were entertained by some eminent members of the Government, by the wife of the Emperor William, and, to a certain extent, by the heir of the throne. Bismarck felt his danger, but his usual good fortune did not abandon him; two unforeseen events did him an invaluable service. First came the letters of the Comte de Chambord, which destroyed all the chances of a monarchical restoration in France at the very moment when this restoration was imminent. France was forcibly thrown back into a political state which, though it is not a republic, is more republican than monarchical. Thiers was not recalled to power, and the French Conservatives gave President MacMahon a tenure of power of seven years; but this act of despair produced just the effects which Bismarck had always wished to produce—a confusion and a sort of moral anarchy, which hindered France from procuring alliances abroad. The second event was the pistol-shot at Kissingen. Such political crimes are always sure to forward the cause against which they are directed. The violent policy of Bismarck against the Catholics found a kind of excuse; his tottering power was strengthened; the German nation remembered his great services. He did not lose his opportunity; the time had come for him to act like a new Richelieu. Many a time did the Duke of Orleans, then called Monsieur, conspire against the Cardinal-Duke; many a time did Louis XIII. turn a favorable ear to the projects of his enemies. Richelieu always respected the royal faction and the royal family, but he never spared the conspirators. One after the other, whether high or low, they were brought to the scaffold; and, as Victor Hugo said, he covered all this blood with his red gown. Our times are milder; we have no longer any political executions; even Bazaine's life was spared after the war. Bismarck was determined, however, to strike Arnim, and in his person the Court party; he confided in his own popularity, and he accepted the duel with Arnim. He had all the advantages on his side—he chose his time, his position, and, when he was once ready, he began hostilities in his own terrible way.

Everybody is asking how it is that all the despatches, the disappearance of which gave rise to a prosecution, are now published. It was a crime against the state to take them away from the archives of the German Embassy in Paris, and to hide them; and now the whole world is at liberty to read them. Of course Bismarck sees the consequences of this publication, but he is ready to accept them. His victory would not have been complete if the despatches had not been known by everybody; there would have remained round Arnim a mysterious halo, which would have screened him, and afforded a shelter to all the enemies of the Chancellor. Now, all the veils are torn apart. Bismarck probably does not underestimate the force of some of Arnim's despatches; but still, as a German and as a diplomat, he believes that he can face him; and it is not only to the Berlin tribunal that he makes an appeal—it is to the whole German nation. He fights a battle which he cannot lose in any sense; and his victory will give him a strength which nobody will ever dare to resist. Such

is at least my estimation of this great trial, and events will show if I am much mistaken. I do not believe that Bismarck has much personal animosity against Arnim; he has struck his blow less at him than at the Court party which surrounds the Emperor, which he cannot publicly face in the Reichstag, and which is constantly working against him. It matters not to him if in obtaining this result he has erected for himself some minor difficulties. Napoleon used to say that dirty linen ought to be washed at home. Bismarck shows much dirty linen to the world, and is not over-delicate. His old friendship with Prince Orloff, the Russian Ambassador in Paris, is not likely to be improved by the singular despatch which he wrote in reference to him; the relations of the German ministers with the press may become for a time a little difficult; the position of the German secretaries will not be made agreeable everywhere by the revelations concerning the relations of Arnim and Count Holstein. But these minor details will be forgotten, and Prince Bismarck has gained a double advantage: he has shown how far he is ready to go in order to destroy a rival; he has assumed in the eyes of Germany the position of the deadliest enemy of France—one who is willing in order to hurt France to favor revolution, and who will do all in his power to remove from her the blessings of a strong government.

This intensity of hatred, this sincerity which is almost cynical, will of course make him the centre of the French animosity against Germany. The French have no great powers for hating—their anger evaporates very quickly, sometimes too quickly; they are taking lessons from Bismarck. They are looking upon him with a sentiment which can hardly be defined. As for the lessons which they might draw from some of Bismarck's despatches, these will not, I hope, be utterly lost. Of course, every party insists particularly on the passages of the despatches which are detrimental to the other. The collection of Arnim's and Bismarck's letters is like a large heap of stones on the high road, from which everybody can pick his own weapon. But it would be almost impossible if under these party recriminations a deeper feeling were not produced by the exhibition of so much hostility. It will be interesting for us to know with what feelings disinterested countries will read the German despatches. Such countries are the witnesses of a duel, and the guardians of the laws of honor. The Cæsars did not mind the sarcasms of the slaves who followed their triumph in chains. Bismarck, while he speaks of the French, boldly says, "Oderint dum metuant"; but he has always shown too much understanding of the relations of all the countries of the world with each other, too much knowledge of the new forces of the universe, to remain quite indifferent to criticisms which should come from another latitude than Paris. It seems to me impossible that the world at large should view with favor the exhibition of such concentrated and wilful hatred of a conqueror towards the conquered; such a virtual avowal of the rights of force; such a contemptuous disregard of the common notions of humanity. Bad times have begun for Europe. Our youth was spent in the golden age of Louis Philippe's reign—an age of peace, of liberalism, of progress. Our generation was not well prepared for the bloody scenes of the age of iron which has begun, and we are not yet accustomed to understand the feelings of such a man as Prince Bismarck.

# Correspondence.

## "AN ALLEGED DICTUM OF COPERNICUS."

To the Editor of The Nation:

Sir: Your correspondent, "J. B. S.," writing upon the subject named above, is doubtless right. Yet Mr. John Fiske and Mr. Lewes have erred in good company.

The facts seem established as follows: Osiander, who had charge of the publication of Copernicus's book, and wrote the preface, in a letter to Copernicus, dated April 20, 1541, endeavored to reconcile him to the presentation of the heliocentric doctrine as a hypothesis simply, and ends by saying: "Sic enim placidiores redderis peripatheticos et theologos quos contradicturos metuis." See the "Apologia Tychonis" in 'Kepleri Opera Omnia,' Frisch's edit., Vol. I., p. 246.

Kepler holds Osiander entirely responsible for the timid and prevaricating preface.

Bertrand, in his 'Fondateurs de l'Astronomie moderne,' gives the text, with the suggestion that Copernicus may have yielded "in pure condescension for his disciples"; but this idea is utterly at variance with expressions in Copernicus's own dedicatory letter to the Pope. The "fear" referred to in Osiander's letter is evidently the feeling which had led Copernicus to withhold his book from publication for several years, and not the timidity which would authorize a published falsehood.

For a good summary of the argument, see Figuier's 'Savants de la Renaissance,' pp. 378, 379; also a citation from Gassendi's 'Life of Copernicus' in Flammarion, 'Vie de Copernic,' p. 124; also Whewell, as cited by your correspondent. A. D. W.

Cornell University, January 4, 1875.

## MESSRS. LIPPINCOTT & CO.'S RESPONSE TO THE MESSRS. CHAMBERS'S "EDITORIAL STATEMENT."

To the Editor of The Nation:

Sir: In view of the recent appearance of an "editorial statement" from the Messrs. W. & R. Chambers relative to our issue of 'Chambers's Encyclopædia,' we beg leave to invite attention to the following exposition of the circumstances under which we engaged in the enterprise therein alluded to, feeling confident that, if the public be placed in possession of the *whole* truth touching the matter, a more accurate judgment will be arrived at than will be possible from a perusal of the Messrs. Chambers's "statement" merely.

The facts are these: When, some fifteen years ago, the Messrs. Chambers commenced the publication of their Encyclopædia, we arranged with them to *import* the work for the American market; but at the same time Messrs. D. Appleton & Co., of New York, commenced to *reprint* it, and in the then existing condition of commerce were able to compete successfully with our importation. Feeling ourselves aggrieved by the action of Messrs. Appleton & Co. in thus interfering with our arrangement, we proposed to the Messrs. Chambers to furnish us with a duplicate set of the stereotype plates of the work, we agreeing to relieve them of all the expenses and risks attendant upon the experiment, and also agreeing that they should share in the profits of the American edition should the result prove pecuniarily successful. Of course, the Messrs. Chambers had no interest in Appleton's reprint, and, as there was a possibility that by this arrangement with us some profit might accrue to them—with no risk whatever on their part, since we promptly refunded to them their outlay in making the plates—our offer was accepted, and we carried the enterprise through at our own risk, and at an expense of many thousands of dollars, even purchasing the interest of the Messrs. Appleton in the reprint which they had undertaken, and prevailing upon them to retire from the field.

In engaging in this transaction there were no stipulations, so far as we are aware, either expressed or implied, that we were to be subject to the dictation of the Messrs. Chambers in the management of our edition, nor were we prohibited from making such emendations therein as might be needful to adapt it to the use of American readers.

The work, as originally written, was of course designed for the *British* public, and it is not strange that in relation to American matters it at times contained language and sentiments at variance with our prevailing ideas, both of men and measures; and in cases where the retention of such sentiments was not material to the accuracy of the work, they were, to some extent, changed before the first appearance of our edition, and more carefully eliminated in our subsequent thorough revision. For instance, we did not think it judicious to retain in our edition the statements of the editors of the British edition, that John Adams "*entertained a decided favor for a hereditary aristocracy*," or that John Quincy Adams "*endeavored to make himself popular* [with the Democrats] *by betraying the schemes of his former political associates*" (!); or in the notice of Prof. Agassiz a statement, touching one of his works, which *he* pronounced "nonsense"—statements all of which the Messrs. Chambers retain in their so-called "Revised Edition." Nor did we think it advisable to perpetuate the exploded theory touching the so-called Bird Tracks in the sandstone of the Connecticut Valley, nor to ignore the fact that something is being done in the United States in the way of Agricultural Education and of Prevention of Cruelty to Animals. Neither did we care to say that Mr. James Buchanan's Administration "*was, on the whole, popular*," nor to place Florida upon record as the "*most southerly of the Confederate States of America*." These are a few of perhaps a thousand instances of more or less importance in which changes in articles were deemed advisable, in order to adapt the work to the needs and tastes of American purchasers; and we claim that the large amount of money that we had invested in the enterprise justified us in making the changes for this purpose.

The pretence that, in making these changes, injustice has been done to the Messrs. Chambers, in their capacity as authors or editors, seems to us simply absurd, since we have caused it to be known far and wide,

through the tens of thousands of circulars that we are constantly issuing, that our edition has undergone careful revision at the hands of our editors—the names of the editors and contributors being given, with the authorities principally made use of; and furthermore, in the CONCLUDING NOTICE to the work, published in the tenth volume, special pains is taken to give prominence to this fact. We believe that the true province of an ENCYCLOPÆDIA is not to advocate the theories of any man or class of men, but principally to embody in convenient form statements of facts; and we do not understand how it can reasonably be demanded that such statements be suppressed merely because they happen to be "repudiated by and hateful to the original proprietors of the work." Whether, in the five cases which the Messrs. Chambers cite in their "Editorial Statement," their editors or ours come the nearest to fulfilling their duties as *Encyclopædists*, may depend, in the opinion of the reader, upon whether, in his judgment, FREE TRADE "*now expresses the most important and fundamental truth in political economy*," as is stated in the British edition, or is "*a dogma of modern growth*"; and whether, as is stated by our editors, under the article VICTORIA I., there does or does not exist "*an unmistakable distrust by a portion of the* [British] *nation of the fitness of the heir-apparent to the throne.*" This last is what the Messrs. Chambers characterize as a "slanderous imputation" which they "are ashamed to copy"; and we have no hesitation in acknowledging that in both these instances the zeal of our editors may have carried them farther, in the discussion of the topics, than was necessary or perhaps prudent. The question, however, is as to the *facts*, and the rights which we had acquired to make changes in accordance with the facts.

Again, in the article on SLAVERY, it is claimed by the Messrs. Chambers that in the American edition "a historical fact of some moment is suppressed," but they omit to mention that in place of the "historical fact" (if their citation may be so called) which is suppressed, several other historical and statistical facts have been substituted. We invite a comparison of the two articles, and beg leave to suggest whether the Messrs. Chambers's objections to the American article do not grow out of the fact that it places the responsibility of the *primary existence* of American slavery upon the British Government.

Finally, as the best possible explanation of the whole matter, we have to say, that through a recent purchase by us from the British publishers, their interest in our edition of the work has ceased, and they, by various means, seem to be making strenuous efforts to create a sentiment here adverse to this edition, and in favor of their own, for which latter they apparently hope to find an extensive market in the United States, and this impression is strengthened by the somewhat ostentatious announcement of the Messrs. Chambers "that the only authentic edition of their Encyclopædia is the one published by themselves." It would appear also that their efforts are being seconded by certain other parties, who look for some pecuniary advantage through the importation of the British edition into this market.

We think we are not mistaken in believing that had it not come to be for the pecuniary interest of the Messrs. Chambers to cause *their* edition of the work to circulate in the United States in preference to ours, the present discussion would never have arisen. But be that as it may, we shall hereafter designate our issue as THE AMERICAN REVISED EDITION, and thus relieve the Messrs. Chambers of all cause of sensitiveness touching the changes which our editors have hitherto made or may make in it hereafter.

J. B. LIPPINCOTT & Co.

PHILADELPHIA, January, 1875.

---

[We shall meddle no further in this controversy than to say (and we may be allowed to say it in spite of the very proper expression of regret to which the Messrs. Lippincott have given utterance), that the embodiment in a permanent work of reference, like an Encyclopædia, of a vague and yet serious imputation on the private character of a living man, which could, from its very nature, neither be met nor refuted, like that cast by the American editor of 'Chambers's Encyclopædia' on the character of the Prince of Wales, was evidence of a lack of editorial discretion which might fairly prepare one for other eccentricities. As regards the proper treatment of Free Trade and Protection, our idea of the duty of an encyclopædist towards them would be the production of a compendious statement of the origin, nature, and history of each doctrine, and some account of the extent to which it was at the present day received by public opinion and acted on in legislation, accompanied, perhaps, by a very modest and careful statement of the writer's own views. In so far as the Messrs. Chambers's version departed from this standard, the American editor would doubtless have been justified in modifying it. Instead of this, however, he produced a kind of protectionist tract, reading somewhat like a campaign document, such as no man would be willing to produce who was in the habit of careful reasoning in political or economical matters, as anybody who edits or writes for an encyclopædia ought to be.—ED. NATION.]

---

# Notes.

A SERIES of 'Brief Biographies' is announced by G. P. Putnam's Sons. The first issues, of eight or ten volumes, will be under the editorship of Mr. T. W. Higginson, and will be devoted to the contemporary statesmen of Europe.——Wilson, Hinkle & Co. publish together as an 'Eclectic Historical Atlas' the maps which accompanied Miss Thalheimer's manuals of history. The exigencies of printing from blocks or plates make the coloring of many of these maps rather a hindrance than a help to a ready comprehension of boundaries and nationalities; and for the same reason, one map too much resembles every other. Otherwise, they will be found useful as sketch-maps not overloaded with details.——The Bureau of Education has issued a pamphlet of 118 pages entitled 'Contributions to the Annals of Medical Progress and Medical Education in the United States before and during the War of Independence,' prepared by Joseph M. Toner, M.D. This compilation seems to us defective in method, but to be creditably full and, so far as we have tested it, accurate. It contains a large number of brief references to early physicians in the Colonies and in the Revolutionary armies, with abstracts of laws prescribing their duties, etc., and much other valuable matter.——The hundredth anniversary of the fight at Lexington will be celebrated by the town on the 19th of April. The exercises will include the unveiling of statues of John Hancock and Sam. Adams, "who had sought refuge from British proscription in Lexington, and were under its protection on that day." The orator of the day is not announced.——Harper & Bros.' edition of Mr. Gladstone's pamphlet on the Vatican Decrees is enriched by the addition of a history of the Vatican Council, and the Latin and English text of the Papal Syllabus and the Vatican Decrees of 1870, taken from Dr. Philip Schaff's forthcoming 'History of the Creeds of Christendom.'——The National Educational Association has published the addresses and journal of proceedings of the session held last year at Detroit. It makes a closely-printed octavo volume of nearly four hundred pages, and may be had of Albert P. Marble, Worcester, Mass., chairman of the Committee on Publication.——A catalogue of the publications of the U. S. Geological Survey of the Territories, under the charge of Dr. F. V. Hayden, comes to us from the Department of the Interior.——We are glad to learn that Scribner, Armstrong & Co. have in press an American edition of Mr. Leslie Stephen's 'Hours in a Library,' which we reviewed last week.

—In many of the mechanic arts it is important to know the percentage of moisture in the air. This is most conveniently ascertained, as everybody knows, by means of the wet and dry bulb thermometer. An objection to the use of the wet and the dry bulb is that it requires a reference to tables, like those in the Smithsonian Meteorological Collection; most people have no tables to refer to, and persons not familiar with the use of tables find some difficulty in managing them. An instrument has been invented by Professor Winlock, of the Harvard Observatory, and named by him the Hygrophant, which makes the use of the tables unnecessary. In hospitals, where it is desirable to keep up a uniform degree of moisture, the readings of the Hygrophant could easily be taken by an attendant of little education; and in private houses the question common in the spring and autumn, "Isn't the house almost damp enough to have a furnace-fire?" or in mid-winter, "Hasn't the furnace-heat made the house dreadfully dry?" could be settled very much more satisfactorily by the figures of the Hygrophant than by vague appeals to the feelings.

—Unlike that of recent years, the necrology of 1874 is not remarkable for the number of great and illustrious names which it embraces. Death has spared the sovereigns of the earth, except the last survivor of the Hawaiian dynasty of the Kamehamehas, William (or Bill as he was commonly spoken of in the press) Lunalilo, after a reign of thirteen months. Nor has any one in the lower walks of life been cut off whose loss has in any appreciable degree affected the destinies of a nation or of mankind. It may be thought that had General Manuel de la Concha not fallen in June before Estella, the Spanish problem would have received a different solution from

that which the past week has revealed ; but the *coup d'état* of January 2 unquestionably buried the Republic out of sight. His country lost also General Francisco Lersundi ; Austria, Field-Marshal Louis Charles Gablentz and Archduke Charles Ferdinand ; the United States, most excellent officers in Generals George L. Hartsuff and John G. Foster, both distinguished in the Rebellion, and having seen earlier service: the one against the Seminoles in Florida, the other in Mexico ; as had also the less-known General Morgan L. Smith, a thoroughly brave soldier, one of Sherman's subordinates in his march to the sea. The war of 1812 first gave employment to Rear-admiral William B. Shubrick—a South Carolina name not new to our naval annals—whose service covered sixty-eight years, and to Commodore William Inman. Death certainly came too soon to Lieut.-Commander William B. Cushing, who won distinction rapidly in the late war, which found him not twenty years of age ; and who in 1864 achieved perhaps the most daring exploit performed either on land or sea when he blew up the Confederate ram *Albemarle* on the Roanoke River. To this list may be added Captain Francis Garnier, a distinguished French officer, assassinated by Chinese rebels, a great loss to exploration and science ; General Alexander B. Dyer, long Chief of Ordnance at Washington ; General John T. Cuxton, a Kentuckian (at the age of thirty-six), who, although the son of a slaveholder, early became an emancipationist, enlisted the first company of loyal Southerners in the war, and was much trusted by General Thomas ; and General William S. Hillyer, one of General Grant's original staff.

—At the head of the politicians as of the men of letters of 1874 stands, of course, François Pierre Guillaume Guizot, the Nestor also of the deceased of both classes. He was born in 1787. Where his rôle as a statesman ended, that of Alexandre Auguste Ledru-Rollin began, in the Revolution of 1848. He was one of those twenty-year exiles who returned to France on the eve of or immediately after the great overthrow of 1870–71, and found themselves more than ever men without a country. There died also in France Jean Louis Victor Adolphe Forcade Laroquette, a minister in the time of Napoleon III., and Goulard, who tried to form a ministry after the Duc de Broglie's failure under MacMahon, and was thought to have died of chagrin caused by his failure. Across the border, the Ultramontane Herr Mallinckrodt, Bismarck's honest and respectable opponent, is Germany's loss in statesmanship. In England, no greater than Charles Gilpin's can be mentioned—a useful member of Parliament, worthy to be remembered—unless we add that of an Englishman by residence and marriage, Sylvain van de Weyer, born in Amsterdam, but one of the three foreigners (the other two being the Prince-Consort and Stockmar) who, during the earlier years of Victoria, helped to govern England. Of obscure origin, he became a journalist and barrister, aided in the separation of Belgium from Holland, and was the trusted adviser of English statesmen. Italy honors the memory of Niccolò Tommaseo, a scholar of no mean rank, as well as a patriot of '48 ; a Dalmatian by birth. In the United States, the deceased, whether to be called more rightfully statesmen or politicians, were directly associated with the agitation for the maintenance or the abolition of slavery. It was a marked coincidence that Fillmore and Sumner, the signer and the opponent *par excellence* of the Fugitive-Slave Law, passed away in the same month (March) and the same week—leading, as in Massachusetts, to some awkward juxtapositions of official eulogy and grief. On the Southern side died Lewis T. Wigfall, whose extravagant support of slavery furnished its adversaries with plenty of ammunition of the softer kind in vogue before the war. The Abolitionist ranks testify also to the lapse of time by the gaps which have been made in them. Gerrit Smith, James Miller McKim, Rev. Beriah Green, and David Lee Child were all representative men, whose work and influence could ill have been spared in the long struggle with the slave power. Mention as politicians should also be made of Nicholas P. Trist, son-in-law of Jefferson, a friend and adviser of Madison, private secretary of Jackson, consul at Havana, and negotiator of the treaty of Guadalupe Hidalgo during the Administration of Polk ; and Cespedes, the Cuban revolutionist, all his life an enemy of Spanish rule in Cuba, at one time President of the Republic so-called, but impeached and deposed in October, 1873.

—The profession of the law has lost Judge James Thompson of Pennsylvania, a good lawyer and serviceable representative in the legislature and at Washington, who (1847–1862) was Chief-Justice of the Supreme Court of his State ; John Meredith Read, till very recently Chief-Justice of the same court, grandson of George Read, one of the signers of the Declaration ; John Bowers Lewis, said to have been the ablest lawyer in Canada ; John Worth Edmonds of New York, better known as a Spiritualist than as a judge ; Benjamin R. Curtis of Boston, perhaps in most respects the ablest lawyer in the United States, a Judge of the Supreme Court at Washington from 1851 to 1857, and shortly before his death the candidate of the Massachusetts Democrats for the seat made vacant by the death of Sumner ; Judge Basil Harison of Michigan, the original of Cooper's Beehunter, who died August 13, at the age of 104 years 6 months.

—Theology, in the broadest sense, has suffered heavily in 1874. Biblical criticism lacks two great lights in Dr. Abraham Geiger and Professor Contantine Tischendorf, while David Frederic Strauss led the way in that critical study of the life of Christ which has been so fruitful of controversial and historical works on the same subject. The Papacy has been deprived of the counsels of Monsignor de Mérode and of the nominal attachment of Father Augustine Theiner, a Prussian convert of 1831, who became a most learned and fertile writer on ecclesiastical subjects, and whose recently published letters have been made much of in Germany by the contestants against Papal infallibility ; of Cardinal Tarquini, one of the few Jesuits who have ever worn a cardinal's hat, and who died within two months after his elevation, a descendant of Benedict XIV., and claiming descent also more remotely from the Tarquins ; Cardinal Barnabo, the head of the Roman Propaganda ; Jean François Landriot, Archbishop of Rheims, born 1816, a celebrated preacher and author of many volumes. In this country three clergymen have died of rather local distinction—Dr. Edward N. Kirk, whose pulpit oratory was once celebrated in Boston ; Dr. James Walker, the venerable and sagacious ex-president of Harvard College ; Bishop Henry John Whitehouse, prominent in the prosecution of the Cheney case in Chicago, whose death afforded the opportunity of a decisive condemnation of ritualism in the appointment of his successor by the Episcopal Convention ; and Elder Jacob Knapp, the Baptist revivalist, said in his time to have converted one hundred thousand people.

—The scientific losses of the year tell most heavily in astronomy, including Peter Andreas Hansen, a mathematician unrivalled in our day ; Johann Heinrich Mädler of Berlin, the associate of Beer ; and Lambert Adolphe Jacques Quetelet, founder and director of the Brussels Observatory. Quite in rank with these celebrities was, in another field—comparative anatomy—Jeffries Wyman. Geology has lost Elie de Beaumont, born in 1798, the successor of Arago in the secretaryship of the French Academy of Sciences, who left unfinished the work which had engaged forty-two years of his life—a general geologic map of France ; and John Phillips, a distinguished British geologist, nephew of William Smith, the "Father of British Geology," professor in three colleges, author of more than sixty books and papers contributed to the literature of geology from 1826 down to the time of his death, and secretary to the British Association, in which office he arranged and edited twenty-seven volumes of Transactions. The Medical Faculty will miss Dr. Francis E. Anstie (of England) and Dr. George Derby (of the Massachusetts Board of Health), both devoted students of sanitary science ; and in a measure Dr. Nathaniel B. Shurtleff, ex-Mayor of Boston, whose medical career, however, and whose adhesion to the doctrines of Spurzheim have been forgotten in his later historical and antiquarian activity ; Dr. Alfred Hitchcock, one of the physicians who assisted at the autopsy on Charles Sumner's body, and who died a fortnight afterwards of the same disease as Sumner's, *angina pectoris ;* Dr. Forbes Winslow, eminent for skill in nervous diseases and in mental alienation cases, author of some medico-psychological works, and often witness as an expert in cases of insanity ; and Louis Philippe Cruveilhier. Indirectly connected with science were Sir Francis Pettit Smith, the first engineer who succeeded in applying the screw-propeller to navigation, and rewarded for his services by a pension—though his title to the credit of the discovery was disputed by Ericsson ; and William Fairbairn, pioneer builder of iron machinery, bridges, and ships. Livingstone's burial in England took place last year ; and another African explorer of repute, Dr. Charles Tilstone Beke, passed away. Arabia was the field in which Heinrich von Maltzan, traveller, ethnologist, and philologist, had last distinguished himself.

—Guizot and Tommaseo must again be mentioned when literature reckons her losses. The first is still *facile princeps*, Jules Michelet being far behind him as an historian, and Jules Janin offering no point of comparison. An obscurer but a painstaking and admirable antiquarian, employed in the MSS. department of the National Library, was Emile Mabille, whose labors throw much light on the ninth and tenth centuries especially. Two other French archæologists and authors were Charles Ernest Beulé, who figured just before his death as Minister of MacMahon's Government, and issued in the summer of 1873 his famous order regulating "civil" interments ; and the Abbé Brasseur de Bourbourg, whose Mexican and Central American researches are familiar to all scholars. Paillard de Villeneuve is

memorable as having been for a long time editor of the *Gazette des Tribuneaux*, to which post he was appointed provisionally, whence it might have been that the saying (made use of, if not invented by him), "The only thing that lasts in France is the provisional," occurred. That delightful Platt-Deutsch novelist, Fritz Reuter; the poet and philologist Hoffmann von Fallersleben; and the wonderful linguist, Hans Conon von der Gabelentz, whose acquirements threw Mezzofanti's quite in the shade, make serious vacancies in German letters and scholarship. The English losses are: "Barry Cornwall" (Bryan Waller Procter); Herman Merivale, professor of political economy at Oxford, and biographer of Sir Philip Francis; Charles Shirley Brooks, editor of *Punch*, and Tom Hood the younger, editor of *Fun*, the rival of *Punch*. Besides these there were Agnes Strickland, the historian; John Heneage Jesse, son of Edward Jesse, naturalist, who long held an appointment in the Admiralty, and was the compiler of very entertaining semi-historical books, the best known of which is the 'Memoirs of the Life and Reign of George III.'; Mowbray Morris, long the manager of the London *Times;* Sidney Dobell, the poet, the son of a wine-dealer, and for ten years himself an assistant in the business. In this country died Charles Astor Bristed ("Carl Benson"); Ralph Keeler, correspondent and writer of magazine articles; Edward Morris, author of 'Ten Acres Enough'; Col. S. C. ("Sandy") Faulkner, of Arkansas, who held public, and, during the Rebellion, military office, but was known to the Southwest as the author or personator of the famed "Arkansas Traveller," a composition which is said to have gained him at the old St. Charles Hotel in New Orleans a special room bearing in gilt letters over the door, "Arkansas Traveller"; Mrs. Anna C. Lowell, of Cambridge, author and teacher; and Mrs. Martha Walker Cook, also a writer to be mentioned with respect. To William A. Wheeler, author of many dictionaries and catalogues, and co-laborer on others which do not bear his name, the reading public owes more than it is ever likely to acknowledge. Literary criticism, as our readers are well aware, suffered an almost irreparable loss in John Richard Dennett. Our publishers and the buyers of foreign books regret the death of Henry Kernot, an ardent and amiable bibliographer. Among foreign publishers Adam Black was best known. Another Edinburgh publisher, James Gall, merits recollection for having introduced printing for the blind into Great Britain after its disuse in Paris for some forty years. A London publisher, George Stiff—who began life as an engraver, became in 1844 proprietor of *Mayhew's London Journal*, and raised its circulation to a figure extraordinary even in these days by means of sensational stories and pictures—may, says the *Bookseller*, "be regarded as one of the principal pioneers of illustrated literature in its present popular form."

—Kaulbach, Fortuny, and Gleyre lend brilliancy to the mortuary record of art, and the names of the painters Theodore Cassagne and Octave Tassaert complete the list for France. In architecture and ornament Owen Jones enjoyed deserved eminence; and in sculpture, particularly portrait-sculpture, John Henry Foley took very high rank, if not the highest, in Great Britain. To both of these professions belonged in some degree Hammatt Billings, of Boston, whose designs ranged from churches and warehouses to monuments (like that at Plymouth) and book illustrations—he made those for 'Uncle Tom's Cabin.' Still another illustrator of books was John Hows, of this city. Among musical artists, Parepa-Rosa was without a peer in her own time, and perhaps in all time. Mr. Brooks, the editor of *Punch*, must also be thought of as a dramatist; his works, he used to say, outnumbered Shakspere's. Scarcely less prolific was Watts Phillips, author of 'The Dead Heart,' and of numerous other popular plays which still keep the stage, and also a forcible caricaturist, as one of Cruikshank's pupils might well be. An equally productive French dramatist, who never attained more than a passing distinction, and who died poor, was Victor Séjour. The theatre also lost Marcus (Mark) Smith, son of the famous manager, Sol Smith, a good stock comedy actor, and for a short period a manager; William Henry West Betty, born in the last century (1791), and called the "Young (or "Infant") Roscius" from having played leading parts in standard drama at the age of twelve or thirteen, and thus gaining a reputation which afterwards broke down; Mdlle. Desclée, the great French actress, and Felix François Edgard, a good comedian, who had long lived in this country and whose services were always in request when French plays were acted here.

—Philanthropists and public benefactors are never wanting in an American necrology. Among those of 1874, Gerrit Smith, Ezra Cornell, and Samuel Williston had made our colleges the recipients of their bounty, while Henry Grinnell had given a powerful impulse to Arctic exploration. The great executive capacity of John Edgar Thomson, the late president of the Pennsylvania Railroad; the inventive genius of Gail Borden, who invented "condensed milk" and preserved meat; the reformatory labors in American kitchens of Pierre Blot; the peculiar industry of John Laird, builder of the *Alabama*, and member of Parliament for Birkenhead; the great wealth of Meyer von Rothschild; and the unique physiological connection of Chang and Eng, the Siamese twins, make them severally worthy of a place in the list of the deceased of 1874. We may add the names of Rev. J. W. Appleyard, missionary to Kafir-land, author of a Kafir grammar published twenty-four years ago, said to be still unrivalled, and translator into Kafir of such books of the Bible as had not been done into that language before his time; Cochise, a bloody Apache chief—for some time, however, a "good Indian"; Edward Dickenson, the Treasurer of Amherst College, a Puritanical man of great integrity, outspoken in his dislikes and making many enemies; Christian Sharpe, the unlucky inventor of the rifle which goes by his name; Joseph Harrison, an inventor who succeeded in making a perfectly safe boiler; Robert Morris Copeland, a New England landscape gardener, author of a single book, 'Country Life,' and of many fugitive writings in the line of his profession; and James W. Gerard, of this city, once a leader of the bar, who did much for the school system, and brought about the uniforming of the Metropolitan police force.

—Some time ago (No. 458) we expressed the hope that the University of Oxford, having completed the publication of the invaluable Icelandic-English dictionary by Gudbrand Vigfússon, would now undertake, for the benefit of English and American scholars, a series of saga texts. We are glad to learn that this hope is about to be realized. Mr. Vigfússon, whom Oxford has been fortunate enough to retain, has already commenced the printing, at the Clarendon Press, of the text of the Sturlunga saga, to be accompanied by ample notes. No better initial volume could have been selected. This saga, from its size and importance, has received the title of 'Islandinga saga hin mikla,' or the great saga of the Icelanders, and is popularly known, in consequence of the general excellence of its style, by the characteristic appellation of 'Blómstr,' or 'The Flower.' The period which it treats extends from 1116 to 1264, but it is most minute in regard to the thirteenth century—the turbulent age of the Sturlunga family, which produced Iceland's most celebrated historian, Snorri Sturluson, and to a member of which, the learned Sturla Thórdarson, the authorship of the saga is generally ascribed. Unlike most of the important sagas, the Sturlunga exists in but one printed edition, that of the Icelandic Literary Society (Copenhagen, 1817–20), in four thin quartos, the text of which is, however, far from critical, while the orthography and typography are utterly unworthy of the work. The British Museum possesses the best manuscript of the Sturlunga.

—Of the works called forth by the Icelandic Millennial anniversary, the most notable is Konrad Maurer's stout volume, 'Island von seiner ersten Entdeckung bis zum Untergange des Freistaats.' The author is one of the most eminent members of the legal faculty in the University of Munich, and enjoys a high reputation for his 'Beiträge zur Rechtsgeschichte des germanischen Nordens' and for other publications relating to Scandinavian literature and antiquities. The present essay is, and is intended to be, rather a historical commentary than a history, comprising, in systematic order, all the principal facts deducible from the ancient sagas and laws concerning the social and political relations, the customs and avocations, the literature and culture, of the Northern islanders during the period of independence. To say that it is the best treatise on Icelandic history accessible to the general reader is no very high praise, for it is written with a clearness, a careful citation of authorities, and a profound knowledge of the subject, by no means characteristic of foreign works which in any way relate to Iceland. The introduction treats of the discovery and physical features of the island and of the character of the settlers; the author showing the unsoundness of those archæological fancies which ascribe to Iceland, in the days of its colonization, a climate more genial and forests more extensive than it at present possesses. This is followed by two sections, the first of which is devoted to the history of the Republic, with an admirable analysis of its constitution, and accounts of the introduction of Christianity, the development of the episcopal power, and the final downfall of the Commonwealth. The second section relates to the internal condition of the Republic, with chapters on "The State," "The Church," "The Community," "Kinship," "Neighborship," "Social Economy," and "General Culture." The final chapter narrates and estimates the changes which followed upon the submission of the sturdy Icelanders to foreign domination. Nowhere else, outside of the Icelandic language, is there so complete an exposition of the complex godord-system upon which the constitutional arrangements of the early Icelanders were so largely based. To the inhe-

rent weakness of this system, which led to dissensions among the great houses of the island, and to the peculiar relations of the church and the state, the author chiefly attributes the subversion of the island's independence.

—Another valuable work which owes its existence to the Icelandic Millennial is a quarto edition of the 'Islendingadrápa' of Hauk Valdísarson, an Icelandic poem of the thirteenth century. The editor is Dr. Theodor Möbius, Professor of Icelandic in the University of Kiel, to whom scholars are already indebted for a long series of critical editions of sagas and various other treatises illustrative of the early literature of Iceland. The quaint old drápa of the almost unknown Hauk, one of the later skalds, is a eulogy of the athletic accomplishments possessed by certain famous Icelanders. In its existing shape it is a fragment of a little over two hundred lines, a large portion of which is now printed for the first time. It is found in but one manuscript—at the end of a vellum Codex, containing portions of the two Eddas—which is preserved in the Arna-Magnæan Library at Copenhagen. The Codex has lost its last leaf or leaves, and hence it is impossible to determine the original length of the poem. Professor Möbius has supplied each stanza with very full notes as well as with explanations of the "Kenningar," or poetical figures, which form such a stumbling-block in the path of the Icelandic student, and has added a complete vocabulary.

## HOWELLS'S 'FOREGONE CONCLUSION.'*

MR. HOWELLS in his new novel returns to his first love, and treats once more of Venice and Venetian figures. His constancy has not betrayed him, for 'A Foregone Conclusion' is already rapidly making its way. A novelist is always safer for laying his scene in his own country, and the best that can be said of his errors of tone and proportion, when he deals with foreign manners, is that the home reader is rarely wise enough to measure them. But in Venice Mr. Howells is almost at home, and if his book contains any false touches, we, for our part, have not had the skill to discover them. His Venetian hero is not only a very vivid human being, but a distinct Italian, with his subtle race-qualities artfully interwoven with his personal ones. We confess, however, that in spite of this evidence of the author's ability to depict a consistent and natural member of the Latin family, we should have grudged him a heroine of foreign blood. Not the least charm of the charming heroines he has already offered us has been their delicately native quality. They have been American women in the scientific sense of the term, and the author, intensely American in the character of his talent, is probably never so spontaneous, so much himself, as when he represents the delicate, nervous, emancipated young woman begotten of our institutions and our climate, and equipped with a lovely face and an irritable moral consciousness. Mr. Howells's tales have appeared in the pages of the *Atlantic Monthly*, and the young ladies who figure in them are the actual young ladies who attentively peruse that magazine. We are thankful accordingly, in 'A Foregone Conclusion,' for a heroine named after one of the States of the Union, and characterized by what we may call a national aroma. The relation of a heroine to a hero can only be, of course, to be adored by him; but the specific interest of the circumstance in this case resides in the fact that the hero is a priest, and that one has a natural curiosity to know how an American girl of the typical free-stepping, clear-speaking cast receives a declaration from a sallow Italian ecclesiastic. It is characteristic of Mr. Howells's manner as a story-teller, of his preference of fine shades to heavy masses, of his dislike to *les grands moyens*, that Florida Vervain's attitude is one of benignant, almost caressing, pity. The author's choice here seems to us very happy; any other tone on the young girl's part would have been relatively a trifle vulgar. Absolute scorn would have made poor Don Ippolito's tragedy too brutally tragical, and an answering passion, even with all imaginable obstructions, would have had a quality less poignant than his sense that in her very kindness the woman he loves is most inaccessible. Don Ippolito dies of a broken heart, and Florida Vervain prospers extremely—even to the point of marrying, at Providence, R. I., an American gentleman whom, in spite of his having in his favor that he does not stand in a disagreeably false position, the reader is likely to care less for than for the shabby Venetian ecclesiastic.

This story is admirably told, and leads one to expect very considerable things from Mr. Howells as a novelist. He has given himself a narrow stage, or rather a scanty *dramatis personæ* (for he has all glowing Venice for a back scene), and he has attempted to depict but a single situation. But between his four persons the drama is complete and the interest acute. It is all a most remarkable piece of elaboration. Mr. Howells had already shown that he lacked nothing that art can give in the way of finish and ingenuity of manner; but he has now proved that he can embrace a dramatic situation with the true imaginative force—give us not only its mechanical structure, but its atmosphere, its meaning, its poetry. The climax of Don Ippolito's history in the present volume is related with masterly force and warmth, and the whole portrait betrays a singular genius for detail. It is made up of a series of extremely minute points, which melt into each other like scattered water-drops. Their unity is in their subdued poetic suggestiveness, their being the work of a writer whose observation always projects some vague tremulous shadow into the realm of fancy. The image of Don Ippolito, if we are not mistaken, will stand in a niche of its own in the gallery of portraits of humble souls. The best figure the author had drawn hitherto was that charmingly positive young lady, Miss Kitty Ellison, in 'A Chance Acquaintance'; but he has given it a very harmonious companion in the Florida Vervain of the present tale. Miss Vervain is positive also, and in the manner of her positiveness she is a singularly original invention. She is more fantastic than her predecessor, but she is hardly less lifelike, and she is a remarkably picturesque study of a complex nature. Her image is poetical, which is a considerable compliment, as things are managed now in fiction (where the only escape from bread-and-butter and commonplace is into golden hair and promiscuous felony). In the finest scene in the book, when Florida has learned to what extent Don Ippolito has staked his happiness upon his impossible passion, she, in a truly superb movement of pity, seizes his head in her hands and kisses it. Given the persons and the circumstances, this seems to us an extremely fine imaginative stroke, for it helps not only to complete one's idea of the young girl, but the fact of the deed being possible and natural throws a vivid side-light on the helpless, childish, touching personality of the priest. We believe, however, that it has had the good fortune to create something like a scandal. There are really some readers who are in urgent need of a tonic regimen! If Mr. Howells continues to strike notes of this degree of resonance, he will presently find himself a very eminent story-teller; and meanwhile he may find an agreeable stimulus in the thought that he has provoked a discussion.

A matter which it is doubtless very possible to discuss, but in which we ourselves should be on the protesting side, is the felicity of the episodes related in the last twenty pages of the tale. After the hero's death the action is transplanted to America, and the conclusion takes place in the shadow of the Fifth Avenue Hotel. We have found these pages out of tune with their predecessors, and we suspect that this will be the verdict of readers with the finer ear. The philosophy of such matters is very ethereal, and one can hardly do more than take one's stand on the "I do not like you, Doctor Fell" principle. One labors under the disadvantage, too, that the author's defence will be much more categorical than the reader's complaint, and that the complaint itself lays one open to the charge of siding against one's own flesh and blood. We should risk it, then, and almost be willing, for the sake of keeping a singularly perfect composition intact, to pass for a disloyal citizen. And then the author can point triumphantly to 'A Chance Acquaintance' as proof that a very American tale may be also a very charming one. Of this there is no doubt; but everything is relative, and the great point is, as the French say, not to *mêler les genres*. We renounce the argument, but in reading over 'A Foregone Conclusion' we shall close the work when the hero dies—when old Veneranda comes to the door and shakes her hands in Ferris's face and smites him, as it were, with the announcement. The author, however, is thoroughly consistent, for in stamping his tale at the last with the American local seal he is simply expressing his own literary temperament. We have always thought Mr. Howells's, in spite of his Italian affiliations, a most characteristically American talent; or rather not in spite of them, but in a manner on account of them, for he takes Italy as no Italian surely ever took it—as your enterprising Yankee alone is at pains to take it. American literature is immature, but it has, in prose and verse alike, a savor of its own, and we have often thought that this might be a theme for various interesting reflections. If we undertook to make a few, we should find Mr. Howells a capital text. He reminds us how much our native-grown imaginative effort is a matter of details, of fine shades, of pale colors, a making of small things do great service. Civilization with us is monotonous, and in the way of contrasts, of salient points, of chiaroscuro, we have to take what we can get. We have to look for these things in fields where a less devoted glance would see little more than an arid blank, and, at the last, we manage to find them. All this refines and sharpens our perceptions, makes us in a literary way, on our own scale, very delicate, and stimulates greatly our sense of proportion and form. Mr. Lowell and Mr. Longfellow among the poets, and Mr. Howells, Bret Harte, and Mr. Aldrich

* 'A Foregone Conclusion. By W. D. Howells, author of 'Their Wedding Journey,' 'A Chance Acquaintance,' etc.' Boston: J. R. Osgood & Co.

among the story-tellers (the latter writer, indeed, in verse as well as in prose), have all pre-eminently the instinct of style and shape. It is true, in general, that the conditions here indicated give American writing a limited authority, but they often give it a great charm—how great a charm, may be measured in the volume before us. 'A Foregone Conclusion' puts us for the moment, at least, in good humor with the American manner. At a time when the English novel has come in general to mean a ponderous, shapeless, diffuse piece of machinery, "padded" to within an inch of its life, without style, without taste, without a touch of the divine spark, and effective, when it is effective, only by a sort of brutal dead-weight, there may be pride as well as pleasure in reading this admirably-balanced and polished composition, with its distinct literary flavor, its grace and its humor, its delicate art and its perfume of poetry, its extreme elaboration and yet its studied compactness. And if Mr. Howells adheres in the future to his own standard, we shall have pleasure as well as pride.

## ENGLISH LEXICOGRAPHY.*

WE have in this work an assemblage of compositions so very heterogeneous in character that few persons, it may be surmised, less catholic in taste than their accomplished author, will be minded to read more, at most, than a third of what is here offered them. "A Fortnight in Faroe" and "Wildbad and its Waters," in the first volume, teem both with amusement and with instruction; and the four light papers in the second volume, though inferior to those just named, are calculated to beguile a vacant hour or two agreeably. As to the leash of review articles about Norway, Harold Hardrada, and Magnus the Good, certainly no known living Englishman but Dr. Dasent could have written them; and we suspect that, among Englishmen and Americans combined, Mr. Marsh stands alone in his competency to pass judgment on them. For ourselves, we feed on them with equal faith and pleasure, and grieve that the banquet is so soon at an end. Of the remaining chapters which make up the volumes before us, one, entitled "Origin of the English Language," is an admirable summary of information touching the sources and mutations of our mother-tongue; and the other, headed "Latham's 'Johnson's Dictionary,'" serves, by its searching scholarship and incisive criticism, to evince the deplorable shallowness, not to say worse, which distinguishes English lexicography, even in its latest developments. On this point we purpose to dilate a little, in the way of reporting some of the most interesting results which Dr. Dasent has arrived at.

Confining himself, chiefly, in dealing with Dr. Latham, to a single branch of his most recent labors, Dr. Dasent states, and very truly, that his "etymology is, generally, of the scantiest, and sometimes of the wildest, kind; and scarcely an attempt is made to show the place in which English stands in the great Indo-European family. We believe Dr. Latham is an unbeliever in the truths of philology. He thinks the wise men came from the West. He is welcome to his unbelief; but a dictionary is not written for unbelievers, but for believers; and the new philological faith is too firmly rooted to be simply ignored. Whoever, compiling a dictionary, does thus ignore it, must do so at the peril of his head, and must look to hear hard things." On the performance in question, "Latham's 'Johnson's Dictionary,'" viewed with reference to all its departments, Dr. Dasent's verdict, damnatory in the last degree, and yet not going a whit beyond the strictest justice, is this: "In the present edition we have almost every one of Johnson's errors and Todd's absurdities, with others which neither Johnson nor Todd would have committed. The truth lies in a simple sentence. Johnson was before his age, Dr. Latham is behind it. The one knew many things of which no one else was aware, and so his work brought light to their eyes. The other seems not to be aware of many things which every one who has any right to call himself a philologist must know; and thus his work serves rather to blind than to enlighten. Johnson's etymology we now see to be entirely wrong; but it was the best the age afforded. We now see in it nothing but confusion; but Dr. Latham's is confusion worse confounded." Only a small part of the new edition had appeared when its critic wrote thus; and Dr. Latham, if he had either regarded his own fame, or had taken sufficiently to heart the needs of the age, would thereupon have thrown up his hand, if conscious, as he must have been, that he had undertaken a task immeasurably too great for his ability. His opinion, however, seems to have been, that what he had at his elbow to give to the world was quite as good as the world deserved; and, such is the popular awe inspired by well-printed quartos, that thousands of decently educated people already consult his pages in firm confidence of finding there the last and the most trustworthy decisions on the English vocabulary that have been reached by modern research. Disappointing as it is to have to say so, the work is, to its very end, just as superficial as its beginning, and not unfrequently is, if possible, more superficial. From first to last, too, Dr. Latham drenches us with the crazy conceits of Mr. Wedgwood, who has ridden to the very death his darling hobby, onomatopœia, if ever hobby was so ridden. It is quite deservedly that Dr. Dasent says of Mr. Wedgwood, on one occasion, that, "after throwing a good deal of etymological rubbish in our eyes, which makes such a dust that we can scarce see where we are," etc. So he does at almost every step where we choose to follow him; and yet Mr. Wedgwood is well-nigh the only nineteenth-century authority on English etymology that Dr. Latham thinks good to recognize.

However, dismissing Dr. Latham and his *magnus Apollo*, let us see what Dr. Dasent has to bring us that is new. He reveals to us that the *a* of *aback* and of many other words is the Norse *á*, which denotes rest quite as much as motion—"on" and also "on to." *A baki* and *á bak* are the Norse for *aback*, in expressions meaning, respectively, "borne *on* the back" and "put *on* the back." *Abroad* has no connection with *broad*, being referable to the Norse *braut* or *bröd*, 'way.' *Again* and *agen*, once different words, are less naturally derived from the Anglo-Saxon *ongeanes* than from the Norse *gagn* and *gegn*, with *á* prefixed. *Against* is the superlative of *again*. *Agate*, now obsolete, came to us, through the Northumbrian dialect, from the Norse *á götu*, from *gata*, 'path.' In *agog* we have the Icelandic *á gœgjum*, from the plural substantive *gœgjur*, 'staring.' *Aloft* is the Norse *á lopt* or *á loft*. Our *alone*, we are informed, has nothing to do with *all* and *one*, but originated, most probably, from the Northumbrian *á laun* or *á lön*, in which we have the source of our *lone* and *lane*. *Aloof* is traced to an expression in Norse, *á hlaupi* or *á löpi*, from *hlaup* or *löp*, akin to our *leap*. *Along*, instead of representing any Anglo-Saxon word, descended from the Northumbrian *á löng*, and the old *alongst* was a superlative, like *against*. *Askant* we are taught to find the source of in the Icelandic *á skakkt* or *a skankt*. *Away* is the Northumbrian *á veg*.

But here we must stop, our space being limited; for which same reason we have forborne to transcribe, even in abridgment, the abundant reasons alleged in support of the etymologies just quoted. Enough, however, has been said and shown to convince scepticism itself that a lexicographer of our language can as little dispense with a knowledge of the Old Norse as with a knowledge of Anglo-Saxon or of Mœso-Gothic.

Dr. Dasent's philology one has to look very closely at to pick flaws in it; for we must presume mere momentary forgetfulness on his part where he writes that, in former times, "*His* was the true common genitive of *he*, *she*, and *it*." *His* was never the genitive of *she*; and our *her* involves only a slight change of the Anglo-Saxon *hire* or *hyre*. To find, as he does, in the *apple-pie*, with which we qualify "order," a corruption of *chapel-pie*, dating from Caxton's printing-house, looks whimsical, to say the least. Moreover, it is too bad that he should allow penny-a-liners and literary slovens an opportunity of pointing to him as capable, at times, of descending to their level. "To see a gannet in Faroe is quite another thing *to* seeing a gannet on the Bass," Vol. I., p. 82. "Parenthetically, we may remark that you had better call a man a fool at once, in Germany, *as* leave out the Herr," Vol. I., p. 131. "Again, if you are angry with him, you cannot ease your mind by patting him, as every right-minded person would behave by a donkey who had *aggravated* him," Vol. I., p. 146. "Neither Godwin nor Harold *were* likely," etc., Vol. I., p. 235. "Therefore we will share this money between us, at once, into *equal halves*," etc., Vol. II., p. 217. "The man *whom* you say robbed you can never be one of my soldiers," Vol. II., p. 363.

A great scholar, the author knows a whole host of words which ordinary folk are ignorant of. Still, it is rather hard that he should so often puzzle the inerudite reader with terms which may cost him a long hunt before he gets any light on them. We may mention, as in point, his "baneman," "byrnie," "candleswain," "ettle," "gurly," "hirple," "niddering," "wardrake." And why try to revive "glode" for "glided"?

But, besides being a great scholar, Dr. Dasent is a traveller; and, in his wanderings, he has, quite as a matter of course, run foul of a "Yankee vulgarian." The "Yankee" first disclosed his nationality by exclaiming: "Tell you what, sirree, in my great country that darned nigger would be located in the nigger-van." As was to be expected, the odious creature pronounced the Strasbourg spire to be "some tall." A further sample of his jargon, which, somehow, he never fully airs except when abroad, is this: "Have you heard of our great Gineral Grant, marm? I dubitate if there's air another gineral in Europe can black his shoes. He is an obstinate old child, marm, and cares nothing for human life, I expect." Once more: "Then let me say that the architecture in our great country is as far supe-

* 'Jest and Earnest. A Collection of Essays and Reviews. By George Webbe Dasent, D.C.L.' 2 vols. London: Chapman & Hall. 1873.

rior to your architectúre in Eurépe as Eurépe is inferior to our great continent." The existence of endurable Americans has, we are aware, some difficulty in getting itself acknowledged by Englishmen of a certain class. Can it be, however, that little sketches, such as that which Dr. Dasent here indulges his fancy in, are likely to contribute towards engendering between two great nations mutual understanding or mutual respect? Much more than by labored arguments, or by violent invective, it is by seeming trifles of this sort that public opinion and public belief are fashioned and stereotyped; and no one knows this better than they do who resort to them as vents for a personal animosity which they suppose it to be for the welfare of England that they should assist in propagating.

*Hovedströmningerne i det Nittende Aarhundredes Litteratur.* I. Emigrantlitteraturen. II. Den Romantiske Skole i Tydskland. By G. Brandes. (Copenhagen : 1873.)—After many brilliant achievements in the first half of the present century, the Danish literature now rests on its laurels. The old generation of authors is rapidly passing away, and no new forces seem to be coming to the front to fill the vacant places. The only literary names of any importance which the last two decades have to show, are those of Wilhelm Bergsöe and G. Brandes, the latter of whom is not a poet but a critic. Denmark has for many years barricaded itself with a Chinese wall of prejudice, national pride, and orthodoxy, and it required a Schleswig-Holstein war, a diplomatic enemy like Bismarck, and a critic like Mr. Brandes, to make it accessible to the great currents of thought which have agitated the nineteenth century. The late Mr. Hauch, an amiable conservative who occupied the position of Professor of Æsthetics at the University of Copenhagen, possessed an admirable talent for softening every harsh and disagreeable truth which might grate upon the ears and offend the taste of his sensitive countrymen. Mr. Brandes, being a man of sterner mettle, and having a broader and more comprehensive mind, knows no such considerations, and consequently his situation in Denmark has hitherto been anything but enviable. If, impelled by revolutionary ardor, he has perhaps at times gone further in his disregard of national prejudice than prudence and conscience strictly demanded, the fact still remains that he has done some excellent work and been of incalculable service to his country.

To make the intellectual results of the nineteenth century accessible and fruitful to his nation, to transfuse its progressive spirit into Scandinavian thought and literature, is the æsthetic mission of Mr. Brandes. His previous writings, the bulk of which prevents us from giving them the attention here which they so amply deserve, all deal with certain phases of intellectual life which until his day have remained comparatively unknown to the extreme North. The present volumes, one of which reviews the Emigrant Literature of France, while the other most entertainingly discourses about the Romantic School in Germany, are obviously part of the same preconceived programme, the scope and purpose of which we have indicated.

For clearness and brilliancy of style, wealth of striking metaphors, and dramatic swiftness of thought, we know of no living critic who surpasses, or even rivals, Mr. Brandes, except M. Taine, whose disciple he freely acknowledges himself to be. His diction, which literally bristles with epigrams and sparkling antitheses, is, however, liable to the same charge as that of his master. It seems to exist principally for its own sake, because it is brilliant, and is not properly subordinate to the thought which it is intended to embody. This, to be sure, is a fault which by many readers would rather be deemed a merit, and we should not have taken it into account if it did not naturally lead to another and graver error, from which the volume on the Romantic School is not altogether free. The author there occasionally sacrifices some measure of truth where the exact fact does not suit the requirements of the antithetical phrase. Where a pet theory is at stake, it is only natural that M. Taine's pupil consents to even greater sacrifices. It is difficult to forgive him when, for instance, to prove the immorality of the life in Weimar, he throws an unwarranted suspicion upon Schiller's spotless memory. We, at least, have failed to find any evidence that Caroline von Wolzogen was Schiller's mistress ; neither do we believe that there is any worthy of that name to be found. Again, the harper in Wilhelm Meister does tell his tale before he dies; and it is probably a mere *lapsus linguæ* when Mr. Brandes calls Heinrich von Ofterdingen a Meistersänger instead of a Minnesinger.

But it is a thankless task to unearth the minor faults of a work which on every page bears evidence of true genius, and the merits of which so far outweigh its deficiencies. The author's acuteness of insight, his great command of illustrative facts, and his broad sweep of vision over the entire historic field of culture, place the present volumes far above anything which the Scandinavian nations have hitherto produced in this department of literature.

*Prepayment of Postage on the NATION to Subscribers being compulsory after January 1, 1875, the subscription price for a full year will be $5 20 (Clergymen $4 20); or the paper will be sent for 50 weeks for $5 (Clergymen $4).*

*MILTON'S POETICAL WORKS.* Edited, with Introduction, Notes, and an Essay on Milton's English, by David Masson, M.A., LL.D., Professor of Rhetoric and English Literature in the University of Edinburgh. With three Portraits engraved on Steel by C H. Jeens and Radclyffe. 3 vols. 8vo, cloth, elegant, $15.

"This edition of Milton's works is undoubtedly destined to supersede all others."—*N. Y. Times.*

*MILTON'S POETICAL WORKS.* (Golden Treasury Edition.) With Introductions, Notes, and Memoir. By Professor Masson. With two Portraits Engraved by Jeens. 2 vols. 18mo, $3.

*SOCIAL LIFE IN GREECE.* From Homer to Menander. By the Rev. J. P. Mahaffy, M.A., Fellow of Trinity College, Dublin. Crown 8vo, $2.

An attempt to give an idea based on contemporary evidence of the social aspect of old Greek life, not dwelling merely on their manners and customs, but endeavoring to express the feelings of the Greek themselves about them. In short, it is the subjective, not the objective side which Mr. Mahaffy means to illustrate.

*THE EXTANT ODES OF PINDAR.* Translated into English, with an Introduction and short Notes, by Ernest Myers, M.A., Fellow of Wadham College, Oxford, and of the Inner Temple, Barrister-at-Law. Crown 8vo, $1 50.

*TALES IN POLITICAL ECONOMY.* By Millicent Garrett Fawcett, author of 'Political Economy for Beginners.' Globe 8vo, $1.

Mrs. Fawcett's idea, in her own words, is to "hide the powder of Political Economy in the Raspberry Jam of a story."

*CHRIST AND OTHER MASTERS.* A Historical Enquiry into some of the Chief Parallelisms and Contrasts between Christianity and other Religious Systems of the Ancient World. By the Venerable Archdeacon Hardwick. Edited, with Memoir, by the Rev. F. Proctor, M.A. Third and Cheaper Edition, in one volume, crown 8vo, $3.

*THE ELEMENTS OF THE PSYCHOLOGY OF COGNITION.* By Robert Jardine, B.D., D.L., Principal of the General Assembly's College, Calcutta, and Fellow of the University of Calcutta. Crown 8vo, $2.

*THE METHODS OF ETHICS.* By Henry Sidgwick, M.A., late Fellow of Trinity College, Cambridge. 8vo.

[*Immediately.*

*THE ELEMENTS OF EMBRYOLOGY.* By M. Foster, M.D., F.R.S., and F. M. Balfour, B.A. With numerous Illustrations. Part I. Crown 8vo, $2 25.

*A SHORT HISTORY OF THE ENGLISH PEOPLE.* By J. R. Green, M.A., Examiner in the School of Modern History at Oxford. Crown 8vo, with Genealogical and Chronological Tables and Colored Maps, $3.

"It stands alone as the one general history of the country for the sake of which all others, if young and old are wise, will be speedily and surely set aside. It is perhaps the highest praise that can be given to it that it is impossible to discover whether it was intended for the young or the old. The size and general look of the book, its vividness of narration, and its avoidance of abstruse argument, would place it among school books. But its fresh and original views and its general historical power are only to be appreciated by those who have tried their own hands at writing history and who know the enormous difficulties of the task."—*Academy.*

*A RAMBLE ROUND THE WORLD.* By M. le Baron de Hübner, formerly Ambassador and Minister, and author of 'Sixte Quint.' 12mo, cloth extra, $2 50.

"We do not hesitate to say that 'A Ramble Round the World is the most interesting book of its class produced in the last ten years. . . . The narrative of the author's travels through Japan and China is one of unbroken interest; there is not a page in it which the intelligent reader would willingly omit. All phases of society are reported after careful observation; the politics, religion, manners, and customs of each nation are exhibited with a sharp distinctness that we have never seen equalled in a work of this kind. As a whole the book is thoroughly satisfying, and we commend it confidently to those who enjoy a narrative of travels at once substantial with information, and pleasing with the wit and wisdom of a shrewd observer and with the art of a skilled narrator."—*The Literary World.*

*BIRDS: THEIR CAGES AND their Keep.* Being a Practical Manual of Bird Keeping and Bird Rearing. By K. A. Buist. With colored Frontispiece and other Illustrations. Crown 8vo, $1 75.

*FOR THE KING'S DUES.* A New Novel. By Agnes Macdonnell, author of 'Martin's Vineyard.' 12mo, paper, $1.

"There is a certain freshness and sparkle about this book which is due to a considerable degree to the choice of period and place which is a little out of the beaten track of novelists. The various parts are sustained by characters of much force and distinctness."—*Athenæum.*

### *PROFESSOR MASSON'S EDITION OF MILTON.*

The importance, in merely a philological view, of Milton's Poems to the language, makes it truly desirable that they should be well and searchingly edited. In the absence of an academy, for the sifting and fixing of English definitions according to their nicer values, there is nothing to prevent the national tongue from sweeping on to wider and wider change but our great literary monuments, such as Chaucer's works, the Bible version, Shakspere's plays, and the "Paradise Lost." Among these, from various considerations of scholarship and intellectual influence, Milton's poetry remains paramount, and is indeed one of the great terminal pillars of English grammar. Recognizing that the Miltonic Poems have this, as well as almost every other kind of literary consequence, Professor David Masson, of Edinburgh University, has given the most elaborate care to the study of Milton's English, in the Editorial Essay, Notes, and Introduction to his recent edition of the Poems, published by Macmillan & Co.

Of what value the merely grammatical study of Milton may occasionally be is shown in the ease with which Prof. Masson decides on the claims of the elegy published in the papers, by Mr. Henry Morley, a few years back, as a recovered epitaph of Milton's. That a little poem, contained on a fly-leaf, should employ the neuter *its* four times, while the whole of the authentic poems of Milton use it three times, stamps the trifle as an effort of one of Milton's admirers, not of himself. The present editor, who has made Miltonic study the labor of many loving years, extracts all the philological value from Milton's English in a way that is exhaustive, and seems to leave nothing at all for future gleaners. In the matter of prosody, the feet, the breaks, the liberties and exceptions are so minutely computed and classified, that it would seem at first sight as if Milton's miracle of melody was reduced to an algebraic formula, which might be possessed by any modern poet. With so clean a besom does the present editor prepare the high-road to an appreciation of Milton as a standard of English.

His notes of criticism are more modest than might be wished, though he is frequently novel and forcible, as when he points out the strategic splendor of Satan's temptation of Christ (in the "Paradise Regained") in bidding him search out through the Parthian districts the remnants of the lost tribes, put there by Shalmanezer, and head a great Parthian revolt against Rome.

It is evidently not a want of ardent appreciation of the text, but a consummately delicate view of editorial function, that prevents Prof. Masson from expanding his critical remarks into admirable essays.

# The Nation.

*NEW YORK, THURSDAY, JANUARY 14, 1875.*

## The Week.

GENERAL SHERIDAN seems on the whole to have been a singular person to select for the duty of pacifying a disturbed district or reconciling opposing political factions. He arrived in New Orleans on or about the 1st inst., and found himself at once in presence of a political problem of so much complexity that for over three years it has puzzled both the Government and the country, and has resisted several investigations. Nevertheless, on the 4th, or three days later, he had, although a cavalry officer who has passed most of his life in the field, mastered it sufficiently to recommend certain legislation about it to Congress, which he did promptly by telegraph, thus outdoing McClellan at Harrison's Landing in 1862, as the latter at least developed his views on the political situation in a written letter. General Sheridan, however, seems not to have been entirely sure of the necessity of waiting for legislation, for he suggested in the same despatch that the object in view might also be accomplished by a proclamation from the President. His plan consisted in declaring by a general act of attainder, or by proclamation of outlawry, a large and indefinite body of citizens to be "banditti," and handing them over to Sheridan himself, to be dealt with by military methods. We can recall no precedents in modern history for this scheme, except the letting loose of Claverhouse's dragoons on the Scotch Covenanters, and of Louis XIV.'s on the French Huguenots, and we can safely say, that at no time within the present century would a general in any country in Europe, except Russia, have dared to send such a despatch to his Government, or that, if he had, the Government would either have suppressed it, and privately rebuked him, or have published it, and openly punished him; and saying this, we bear in mind the Napoleonic decree of December 8, 1851, which made liable to seizure and banishment to Cayenne all persons who had ever belonged to secret societies. Our Secretary of War, however, warmly approved of it.

---

Sheridan's subsequent despatches are in keeping with the first one. In a report on the occurrences attending the attempt to organize the legislature on the 4th inst., and of which he had only hearsay information, he not only recites facts, but gives conclusions of law with an assurance worthy of Mr. O'Conor or Mr. Evarts. He decides off-hand that Mr. Wiltz's taking the chair was "an arbitrary and unlawful proceeding" and "revolutionary action," and that the address of the Radical members to the Governor, asking him to intervene, was "reasonable and in accordance with law"; and he justifies the compliance of the military commander with the Governor's request to furnish troops to take part in the organization of the legislature on the ground that somebody (we suppose the officer in question, he does not say who), "remembered a terrible massacre on the assembling of the Constitutional Convention in 1866 at the Mechanics' Institute," and "believed that the lives of the members of the legislature would be endangered in case an organization under the law was attempted." He decides, too, that the persons who were expelled from the floor "under directions from the Governor of the State," "had been illegally seated, and had no legal right to be there"; and he closes by pronouncing Wiltz, the speaker, "a usurper." According to these rulings, the Governor of any State has a right to call upon the Federal troops to occupy a State House in anticipation of the meeting of the legislature, and if the commanding officer can "remember" any riot or massacre as ever having occurred in the State capital or in the neighborhood, and "believes," or says he believes, there will be bloodshed, he is justified in sending soldiers into the House to determine the qualifications of the members.

Considering that it is a little over fourteen years since the outbreak of the war, it must be admitted, in view of the above, and of Mr. Boutwell's issues of paper-money, that we have got on pretty rapidly. At this pace, we shall probably see it maintained by the year 1890 that the President has the right to inflict capital punishment with his own hand on all persons whose behavior in his immediate view and presence leads him to believe they may subsequently become dangerous to the public peace. In fact, Sheridan's despatches about his own safety and "the impregnation of the air with assassination," down in Louisiana, recall the English traveller's story, that President Monroe wore his hair cut close to the skull during his term of office to protect him against being gouged. There are numerous stories, of which at this writing we are able to say no more than that they seem probable, that the Cabinet is divided in sentiment about the Louisiana affair, and that Secretaries Fish, Bristow, and Jewell disapprove of the use made of the troops in Louisiana; and we may add that, if this be true, the line of division lies just where we should, on general grounds, have expected it to lie. The President's course it would be difficult to predict. In fact, one of the great difficulties of this and all other embarrassing situations during the past two years, lies in the fact that the very obstinacy of temper which made him so formidable in the field, now, when combined with the self-confidence bred by his re-election and the flattery of his adherents, not only makes him impervious to public opinion, but makes all criticism of him seem an act of insolent hostility, to be punished or defied. The newspapers, too, which in this as in other free States are the only channels as yet provided through which public sentiment finds vent, he looks on very much as Prince Metternich looked on them, as pestilent nuisances, to be borne with if necessary, but not heeded. We cannot now recall any prediction of ours about his course which turned out false, and have never in the least shared the more extravagant anticipations of his enemies; and we cannot help believing that he will, with his growing infirmities of temper, give cause for a good deal of trouble and anxiety, in his character of "a plain, blunt man," or "a simple-minded, sagacious man," before his term of office expires.

---

One of the most striking features of these Louisiana troubles is the remarkably novel nature of the justifications and explanations brought forward by the President and his military advisers whenever they are accused of violating the Constitution and laws. The gist of the complaint made against them is that they have committed illegal acts, and to this they reply, not that the acts are legal, but in some one of the following ways: 1st. They say they would not have done them had not the persons whose persons or property they have wronged belonged to the class known as "ex-rebels," who, fifteen years ago, engaged in a "fratricidal war." 2d. They say that a general state of excitement and domestic violence exists, which cannot be quieted in any other way than by the commission of high crimes and misdemeanors. 3d. On being asked to point out some of the excitement, they generally produce a list of murders said to have been committed in remote districts and in former years by persons not connected in any way with the case in hand; the evidence of these murders generally being a statement by somebody or other that in certain parts of the country there prevails what General Sheridan calls a "standpoint" which "renders life insecure." 4th. They ask, if the people did not want to have the President commit unlawful and unconstitutional acts upon them, why did they "call him in"? 5th. On being reminded that, in the first instance, the people of Louisiana did not "call him in" at all, but that he called himself in, and with a number of soldiers has kept himself in ever since by main force, they say that this was done because Louisiana was not

reconstructed. 6th. On being reminded that all the other States are reconstructed, and that this is a question between Congress and the State, they say "that is very true; that is just what they have maintained all along." General Sheridan is now understood to be at work upon a list of murders.

The meeting at the Cooper Institute on Monday evening to protest against the interference in Louisiana was large and enthusiastic—or, to put it more accurately, indignant. The speeches, dealing as they necessarily did with a long history of facts difficult to follow, were of a grave character, and the tone of the meeting was more serious and less emotional than a public political meeting is apt to be. The assemblage was rather Democratic than Republican—so far as the distinction of parties can be said now to exist in this city; that is to say, many of the men principally concerned in organizing it were known and are still known as Democrats. On the other hand, neither the temper of the crowded audience nor the tone of the speakers was partisan, and the resolutions adopted were confined to a single point—the illegal acts complained of. A meeting of the same kind, but still more Republican in complexion, will be held in Boston to-morrow night.

Since the holidays, Congress has been mainly occupied with the Louisiana case, and has not succeeded in accomplishing much business. On Tuesday of last week, in the Senate, Mr. Thurman, of Ohio, introduced a resolution calling on the President for information as to the interference by the United States army in the organization of the Louisiana Legislature, which led to a protracted debate, Mr. Conkling, on behalf of the Republicans, insisting on the adoption of an amendment, to the effect that the President should furnish the information "if in his judgment it is not incompatible with the public interest." On Friday, Mr. Schurz submitted a resolution of enquiry concerning the legislation necessary to secure self-government for Louisiana, and on Monday supported it in one of his incomparable speeches, perhaps the last great effort of his Congressional career, and in all respects a fitting termination of it. In the House the members occupied themselves on Wednesday with Louisiana, and Irwin was arraigned for contempt, and, still refusing to answer the questions addressed to him, was remanded for custody to the common jail. The next day the Senate Finance Bill passed the House under the previous question by a vote of 136 to 98. Mr. Maynard, who had charge of the bill, was accused, apparently with reason, of treachery to the other members of the Banking and Currency Committee. On the same day, the resolutions of impeachment in the case of Durell and Busteed were laid on the table, and General Butler introduced a bill providing for a new election in Louisiana under the auspices of the Federal Government.

The Pacific Mail enquiry still goes on, and, notwithstanding Irwin's refusal to testify, some interesting though not surprising facts have been brought out. Mr. R. C. Parsons has acknowledged the receipt of some thirteen or fourteen thousand dollars, which were paid him, he says, for legal services, the examination of statistics, and arguments. Mr. Schumaker, who declares his services to have been of a legal character, has given an account of his two hundred and seventy-five thousand dollars, and has confused matters and blackened his own character by his unintelligible explanation. $50,000 of it he paid to a certain General Smith, and almost all the rest of it he said he returned to the Company. The great event of the week, however, among the lobbyists, who take a keen and increasing interest in the investigation, has been the refusal of one Abert to tell what he did with some $100,000 paid to him by Irwin. He fortified his refusal with an opinion of Reverdy Johnson's, to the effect that, being a lawyer, he had no right to disclose the confidential communications of his client Irwin. The confidential communications which he felt a delicacy about revealing were in reality the names of the persons to whom Irwin had told him to pay the money, and the professional stand taken by Mr. Abert no doubt filled certain gentlemen in Washington with a pleasure almost as great as, and at the same time less selfish than, the satisfaction they manifested a few days before on learning that "old Bill King had been smoked out at last." Indeed, Mr. Abert's position, if sustained, would have rendered it only necessary for any member of the lobby to be enrolled as a member of the bar to enable him to begin at once a career of unparalleled and unblushing corruption, without danger of any human accountability. But Abert, apparently feeling that prudence is the better part of honor as well as of valor, shortly afterwards gave the names to the House. According to this statement, he paid the money, in amounts varying from $500 to $25,000, to persons connected with the press, $45,000; ex-Postmaster General Randall, $5,500; R. C. Parsons, $1,500; ex-Mayor J. G. Berrett, "for himself and Sam. Ward," $7,000; O. J. Averill, ex-collector of internal revenue, $9,000; besides large sums to "operators," door-keepers, and so on. Mr. McFarland, a correspondent of the *Philadelphia Press*, received $25,000, but swears that he received it for and at once paid it to Col. Forney. The door-keepers have not yet been thoroughly examined.

The first messages of Mayor Wickham and Governor Tilden are refreshing documents, and the former had the advantage of appearing on the heels of the recent official action which had relieved the city of the services of some very worthless public servants, and therefore seems an earnest of more work of the same kind. The latest descent of Mr. Wickham has been upon Mr. E. Delafield Smith, the Corporation Counsel. Whether the technical ground on which the Mayor proposes to remove him—that he has been guilty of egregious failure to protect the city against the fraudulent claims by the proper legal means—is tenable, we do not profess to know, though we have our suspicions; but this we do know—that the bar of the city will breathe a sigh of relief when he is gone, and welcome with profound satisfaction the appointment of an honest, capable, and competent successor. In his message to the Common Council, the Mayor does a thing which we believe has not usually before been tried in communications of this kind, and it is an experiment which will turn out, even as a mere political device, highly successful—he tells the truth about the city. As to the finances, for example, he frankly states to the city legislature that neither he nor any one else knows the exact condition of affairs, and he also says that he considers this bad, and will do all in his power to put an end to it. He discusses all the subjects of which his message treats in a frank and decided way, which has won him already the substantial approval of the press and the public. Mr. Tilden's message is an able state-paper. He discusses among other things, with a peculiar fulness of information, the difficulties which in this and probably other States have attended all attempts to recover public money stolen under the forms of law by local public officers like Tweed. He points out that as the local officers who are entrusted with prosecuting the thieves generally or frequently do the thieving themselves, the prosecutions in such cases are not likely to be effective, and therefore suits against them ought to be maintainable on the general principles for equity jurisprudence by the State itself. The Court of Appeals has, in what we must say is a very extraordinary decision, held that such suits are not maintainable, and the legislature certainly ought to take some steps in the matter.

Mr. Albert Grant, or, as he is now called, "Baron Grant," under a German title, who is the London equivalent of Jay Gould, and the promoter of all sorts of companies on the London market whose stock is difficult to float, and was the principal engineer of the Emma Mine scheme, has come before the courts in a curious way. One Rubery, who planned the diamond swindle in California, got up a company in London to work the diamond fields. The enterprise was, however, severely denounced in the money article of the London *Times* by Mr. Sampson, for many yeaars and until very

recently the "city editor" of that paper. Rubery thereupon sued Mr. Sampson personally, and not the paper, for libel, and joined Baron Grant in the action, on the ground that it was he who had inspired the libels, and evidently relied on his threat of exposing the relations between Sampson and Grant to bring about a settlement without going into court. The two defendants stood fire, however, and the *Times* defended the suits. Rubery produced in court checks to the amount of $15,000 which Grant had at various times paid to Sampson, and which a clerk of the former had been bribed to steal, and Grant was forced on cross-examination to explain that the money had been paid to recoup Sampson's losses on the stock of various new companies in which Grant was in the habit of allotting him shares. The rule which governed their dealings was that if the shares thus allotted rose, Sampson pocketed the profit; if they fell, Grant paid him the amount of the loss. The affair has caused great scandal in "journalistic circles," and is a fresh illustration of the enormous difficulty of getting the money articles of a great newspaper honestly written by a man competent to write them. The temptations of the position seem to be more than the supply of virtue thus far found in the male sex of the Caucasian race is equal to.

---

One of the modes in which Rubery tried to bring Grant to terms was by threatening to send a telegram to each director of the Emma Mining Company, asking him "if he was aware that Albert Grant, late of the Crédit Foncier, was the moving spirit and chief partner in the Emma Mine, and that his connection therewith would be exposed on Monday?" and counsel declared in court that this threat was indictable, as an attempt to extort blackmail. Apropos of this low view of the Emma Mine, a Baltimore correspondent writes to us to say that there is a gentleman in that city "whose personal character, intelligence, property, and sources of information are such as to command respect and confidence for any statements he may make, and who asserts that General Schenck was never a director of the Emma Mining Co., and that he held no official relation to it whatever; that he was merely a stockholder, having purchased and paid for shares, for which he subscribed under representations made to him by parties who brought him introductions, and that he never was a willing party to any subsequent use of his name in connection with the Emma Mine; and that he was in fact a victim of and not in any sense a party to the swindle."

---

As this means that the *Nation* has gone on for two years denouncing General Schenck on charges which have not a particle of foundation, we shall now take leave to warn the citizens of Baltimore against the gentleman above-mentioned as a reckless and untrustworthy person, whose "intelligence and property," instead of doing him credit, ought to make him ashamed. The prospectus of the Emma Mining Co., which now lies before us, and which was published for many weeks in the London papers, contains the name of "Major-General Robert C. Schenck, United States Minister, London," in big letters in the list of directors. Worse still: the same name appears as that of one of the three "trustees" of the swindle. Moreover, when the London *Economist* and other English papers had commented in sharp terms on the scandal of a foreign Minister's allowing his name to be used in this way, General Schenck, *after the shares had, on the strength of his name, gone off in a few weeks*, resigned these two offices, in a letter which was printed in all the papers, in which he expressed strongly his continued confidence in the mine. Lastly, on being followed up by one of the stockholders, Mr. Paffard, who has published a pamphlet about the transaction, the General admitted to this gentleman that he had no money to pay for his shares himself, but had to borrow it from a friend; and we will add that the general belief in London is that the friend was one of the promoters of the mine, and that the stock was allotted to him on the same terms as those on which Baron Grant allotted stock to Mr. Sampson — in short, that the General has not lost one cent by the mine, while Grant, Park, Stewart & Co. have made millions.

---

Apropos of the controversy over the civil allegiance of Catholics which Mr. Gladstone raised, and which still rages, M. Emile de Laveleye, the well-known economist, publishes a letter in the London *Times* recalling a curious incident of recent modern history which well illustrates how completely the relations of the Catholic Church to the state are regulated by necessity—that is, they are everywhere and always, in spite of the lofty demeanor of the bishops, what the people of any particular state insist that they shall be—a fact which of itself goes far to justify Bismarck's crusade. In 1815, the King of Holland and Belgium gave his kingdom a constitution embodying the usual modern guarantees of freedom —amongst others, complete religious freedom, equal legal protection for all creeds, and equal eligibility of persons of all denominations to public office. The Catholic bishops of Belgium thereupon met and condemned the constitution in a "doctrinal judgment," and caused its rejection in the Assembly of Notables by 798 to 527. M. Laveleye reproduces this judgment textually, and in it the bishops declare that any person who took the oaths prescribed by the constitution would "commit a great crime, and betray the dearest interests of his religion," inasmuch as the articles guaranteeing religious liberty and offering equal protection to persons of all creeds, are really an offer to put truth and error on the same footing; inasmuch as the article making persons of all creeds eligible for all offices might result "in confiding the interests of the Catholic faith to Protestant functionaries"; and inasmuch as the article which provides that the King "should see to it that all denominations were kept in the obedience due to the laws of the kingdom," "was to give the sovereign the right of obliging the clergy and the faithful to obey all the laws of the state, of whatever nature they might be—that is, to render them liable to co-operate in the enslavement of the Catholic Church," and, in fact, "subject the spiritual to the caprices of the secular power." In 1830, after the revolt of the Belgian provinces from Holland, the Liberals carried a constitution containing all the features which the bishops found so objectionable in 1815, and then, as there was no other resource, the Pope discharged an encyclical letter at them. In short, the church puts up with modern ideas when it is compelled to do so by physical force, but not sooner or otherwise. It curses and struggles until the policeman arrives, and then submits and pretends that it always liked what it had been blaspheming.

---

On the 6th inst. President MacMahon sent a message to the Assembly, again urging Constitutional legislation, including provision for the creation of a Second Chamber, to which he attaches great importance, and for the maintenance of the Septennat in case of his own death before the expiration of his term of office, and suggesting that, when the Second Chamber was created, both could decide upon the form of government to succeed the Septennat. The ministers accordingly put the Constitutional bills on "the order of the day," and M. Batbie moved for the consideration of the Second Chamber Bill first, but his motion was defeated by a large majority, made up of all parties, though it was subsequently decided that the Constitutional bills together should come up for debate on Monday, the 11th. The Cabinet, however, took its defeat so much to heart that it resigned, and Marshal MacMahon refused to accept their resignation until he could form a new one, and asked the Duc de Broglie to undertake this task; and it was generally supposed in Paris that he would act on a dissolution programme. He has, however, informed the President that he cannot take office until the Constitutional bills have passed; pending this, the present Ministry remains in office, and it is believed that MacMahon himself will then press for a dissolution. Whether he can bring it about, however, is, as we intimated last week, very doubtful. The certainty that the larger portion of them would, in case of a dissolution, have to retire into private life, will of course exert a powerful influence on the sitting members.

## THE LAW AND THE FACTS IN LOUISIANA.

WE wish it were possible to discover some excuse, we will not say for the recent interference of the Federal troops with the organization of the legislature in Louisiana—of course subordinate military commanders are everywhere liable to make mistakes—but for the failure of the President and his Cabinet to telegraph prompt disavowal and rebuke of it as soon as the news reached them. But we have, after diligent search, been unable to light upon anything that can put a good face on it, and we propose now to lay before our readers what we honestly believe to be the pertinent facts of the case, without extenuation or malice. It is, in the first place, to be observed that the situation in Louisiana which led to the recent events cannot have taken the Government in Washington by surprise. The situation is in all essential features more than three years old. The character and relations of the principal actors in it have been long known. The liability, in particular, of the United States troops to be used for unlawful or improper purposes by one of the contending factions, is a fact which was brought home to the President in 1872. In that year, the Kellogg faction procured an order from a United States judge, and called on the Federal troops to execute it, and under it these troops took possession of the State House and organized the State legislature, admitting nobody to the Assembly but such persons as the United States Marshal pointed out. This order was examined by a committee of the Senate and pronounced "reprehensible and wholly void" on its face, and all the proceedings taken under it null and outrageous. Moreover, the impeachment of the judge who issued it was recommended by a committee of the House, and he resigned office to escape trial, and has lately in this city denounced his own acts himself and thrown the blame of them on "the politicians."

The President was, therefore, fully aware of the special dangers of the crisis at New Orleans, but seems to have taken no precautions against the repetition of the occurrences of 1872, and to have issued no fresh instructions to the military officers more exactly defining their duties. Accordingly, when the day came for the new legislature to meet, Kellogg seems to have been still under the impression that he could have the assistance of the troops in "controlling" it, as the politicians say, and the troops seem to have received no warning as to the nature and extent of their relations to him.

Now, it will not do to say that he or they supposed that the proclamation issued by the President on the 15th of September, directed against the persons who had overturned the Government by force of arms, was still in force. That proclamation was called forth by a state of things which had totally ceased to exist. The "domestic violence" which had justified it was at an end. Kellogg was again in possession of his government, and his officers again at their posts; an election had been held for the State officers; the lawful Returning Board had counted the votes; and the committee sent down by Congress was peaceably sitting in New Orleans enquiring into the political condition of the State, for the information of the United States legislature. There was no disturbance or disorder of any kind. Kellogg had made no fresh call for Federal aid, and the civil police were not resisted, and the courts were sitting, and the legislature which, and not the Governor—as Mr. Evarts forcibly pointed out at the meeting last Monday night—constitutes the State government, could be and was convened. In short, the state of things had all the marks and tokens of peace, as that term is used by the Constitution and the laws. If crime was rife, it was crime of a kind with which the State government is competent and bound to deal. Nevertheless, preparation was made for the meeting of the legislature by occupying the State House with Federal troops and preparing it for a siege, and the members actually entered it through lines of sentries.

Under these circumstances, the Returning Board, after two months' examination, made out a list of persons elected members of the General Assembly. Our belief is that that list was fraudulent, but for the purposes of this discussion we are willing to admit that it was honest and correct. We would warn the reader who has accompanied us thus far, however, against the supposition that there is anything novel or mysterious about this Board, or that there is anything in its functions which makes the organization of the legislature in Louisiana a process in any way peculiar, or takes it from under the ordinary rules of parliamentary law. The Returning Board differs in no essential point from the Board of State Canvassers in this State, except that it has the power of enquiry into the regularity of the election. It simply "canvasses and compiles" the statements of votes sent in by the Commissioners of Election, decides *primâ facie* who have been lawfully elected to the General Assembly, and makes out a list of them. At this point the Louisiana statute of 1872 does differ somewhat from our law. It provides that the Secretary of State shall transmit to the Clerk of the House of Representatives of the last legislature the list of persons so declared duly elected by the Board, and directs the Clerk to place the names of the persons so returned as elected on the roll of the House, and declares that "the representatives whose names have thus been placed on this roll, and none others, shall be competent to organize the House of Representatives." But a similar arrangement exists in Massachusetts, as well as in other States. In Massachusetts, the Secretary of State delivers a similar list to the Sergeant-at-Arms, who admits the persons named on it to the House, of course excluding all others, and they, and they only, are competent to organize the House, under the presidency of the senior member present.

Now, what rights usually enjoyed by legislatures in this country and in England under parliamentary law did this provision of the Louisiana statute take away from the Louisiana House of Representatives? None—absolutely none. Article 34 of the State constitution of 1868 provides in the usual form that "each House of the General Assembly shall judge of the qualification, election, *and return* of its members, but contested elections shall be determined in such manner as may be prescribed by law." Section 35 authorizes the House to "determine its rules of procedure, and punish members guilty of disorderly conduct." In other words, the constitution simply confirms the immemorial usage of parliamentary bodies, in according to the legislature the power absolutely necessary, as the experience of one thousand years has proved, to its dignity, its independence, and the proper discharge of its duties.

Perhaps, however, somebody will say, this power has been curtailed by the law above indicated prescribing "the manner of determining contested elections." Nothing of the kind. This law is to be found in Section 1,417 of the Revised Statutes of 1870, which provides "that, in all contested elections of the General Assembly, the power rests with each House to determine which of the parties is entitled to the seat, and to award it accordingly." To make assurance doubly sure, and to guard against all mistake, Section 1,386, prescribing the manner of contesting elections to administrative offices before the District Courts, declares "that nothing in the act contained shall be construed so as to take aught from the power given to each House of the General Assembly to be judges of the qualifications of its own members." Nor does the Act of 1872, creating the Returning Board, in any manner impair this right. Section 44, which defines the duty of the Board as to the list of members, expressly provides "that nothing in this act shall be construed to conflict with Article 34 of the Constitution."

It is therefore clear that the Louisiana Legislature stood, on the day of its meeting, in the position of Congress and all the other legislatures in the country. It was in full possession of the "ancient, natural, and undoubted privilege" of organizing itself in its own fashion, and deciding for this and all other purposes who were its members and who were not. The law ordained that only the persons named on the lists of the Returning Board should take part in the organization; but the execution of the law lay with the legislature itself. No power on earth was competent to superintend, revise, or check its proceedings. If, as the Radical members assert, there was unfairness in the election of the Speaker, it was a thing which has happened before, which will happen again, and for which, like any other fault or folly, there is no remedy beyond an appeal to

public opinion. If it had proved impossible to elect a Speaker, owing to the unnecessary turbulence or absence of members, it would have been a state of things, however discreditable, which has been witnessed in the Federal House of Representatives and in the General Court of Massachusetts for days and weeks together. If persons not qualified voted in the organization, it was to the House itself, after the organization, that complaint should have been made. The "petition" addressed by the Radical members to Kellogg was an absurd and ridiculous document, which that person had no more right to entertain or act on than the writer of these lines. No Governor or President has a right to have hand, act, or part in the organization of any legislative body, or in controlling or directing its proceedings. It is not amenable to him in any manner or form. If any one portion of a legislative body finds itself oppressed or outraged by another, it must, under the immemorial usage of civilized constitutional states, appeal to the honor, patriotism, and sense of justice of its opponents, and if this fails, if right and justice are sacrificed to party, there is, as Cushing finely says, "no alternative but to appeal to that tribunal which revises the decisions of all others—the tribunal of the future, eternally and everywhere sitting in judgment on the past, whose judges are the people, and whose judgments are recorded in public opinion." This is no rhetorical dictum or bit of Sentimentalist vapor. It is a doctrine which lies at the very foundations of free government; for if the legislature is not independent or irresponsible, the executive is or may quickly become a despotism. When Kellogg, therefore, presumed to act on the Radical petition, and called in the aid of the troops to enable him to coerce the majority of the members of the House, whether that majority was real or ostensible, he committed a high crime and misdemeanor, for which he ought to be punished. The notion which General Sheridan seems to entertain that the Governor's demand for Federal troops justified General de Trobriand's action in the House, may be put in the same category with the notion that American citizens can be outlawed by Executive proclamation.

As regards the proper mode of dealing with this question on the part of the public, it is difficult to know what to say. The Louisiana problem, in all its odious deformity, has now been before us for over three years, and if, during that period, there had been the slightest sign of a desire or intention on the part of either the President or the majority in Congress to set up an honest government for the good of the people of the State, we should counsel the greatest forbearance towards any mistakes the Administration or its agents might make—towards even such hideous mistakes as this last one. But, as every man at the North knows in his heart, the history of Federal interference in the affairs of the State is the history of the connivance of a great Government at the efforts of a small band of rascally adventurers to live by fraud, corruption, and intrigue. The first great scandal in the dismal tale—the abduction for twelve days, on board the United States revenue-cutter, of enough members of the State legislature to prevent the formation of a quorum, in 1872, by the Federal collector of the port, Casey, the President's brother-in law, was a fitting beginning of all that has since occurred; and that, like the latest outrage, passed without one word of rebuke from Washington. When we ask what the Republicans, either in or out of Congress, have done to put a stop to this shameless caricature on civilized government, the answer is—nothing, absolutely nothing. They have remained silent and often approving spectators, and now, when the climax has been capped, and the thing has become so bad that it is furnishing solid and valuable capital to the Democrats, good Republicans will not touch the matter because the Democrats are excited about it—under the argument *ab irâ infidelium*. So that it is very difficult to see how the reform is to be brought about, or why the firm of Kellogg, Packard, Casey & Co. should not carry on business in Louisiana for ever. The last few days have in fact furnished us with an astounding illustration of the extent to which the ignorance or indifference of large numbers of intelligent men has gone in matters pertaining to the very foundations of the Government, in the enquiries we hear on every side whether there may not be circumstances which justify a brigadier in going into a legislature and selecting for military arrest the persons whom he thinks ought not to be there. One might as well ask whether it might not be good practice for a doctor to make an incision in one of the valves of a patient's heart, and whether it would not be well to wait for the diagnosis before condemning the treatment.

As regards the people of Louisiana, we trust they will remember that the most effectual aid they can render to the right-minded men at the North in putting an end to the régime which has made their State the scandal and disgrace of constitutional government, is by maintaining perfect order. If they do this, their deliverance, though it may not come this winter, is sure to come before long.

## THE CONGRESS OF ST. PETERSBURG.

WITHIN the past two years, a movement has been set on foot among the philanthropists of Europe to make some changes in the customs and rules of war respecting the wounded and prisoners. Originating, or at least appearing to originate, in the voluntary action of private citizens, the reform was to be accomplished by diplomatic action and a general congress or treaty. Societies were formed to promote the measures, and they presented the matter to the different governments. Early in 1874, the Russian Government appeared as the special champion of the project; and from that time all the operations were carried on by it, as an avowed object of its policy, in which, however, it was aided from the outset by the co-operation of Germany. A circular letter was addressed by Russia to all the cabinets of Europe, inviting them to unite in a Congress at Brussels in July. In the published statements of the voluntary societies, and in the earliest Russian correspondence, the purpose announced was purely a humanitarian one, and was represented to be merely the adoption of rules which would ameliorate the condition of prisoners and the wounded. The governments very generally, if not universally, signified their intention of taking a part in the conference. In this position of the affair, Prince Gortchakoff sent a note to the Russian Ministers at the different courts, which, with most of the stock phrases of the Sentimental school—"the solidarity of the peoples," and the like—announced that the Russian cabinet had prepared "a project for an international code with the object of determining the laws and usages of war," which, however, "is only a starting-point for ulterior deliberations, and will, we trust, prepare the way for a general understanding." "The motive," he added, "by which it is inspired is one of humanity, which, we are convinced, will meet a general feeling, a general interest, and a general need." The contents of this proposed code, notwithstanding the humane motives to which its origin was ascribed, startled the European statesmen, and opened their eyes to the nature of the ulterior designs of the Russian Minister. Some of its provisions, as will be seen, would destroy at one blow the naval strength of maritime countries, and its effect as a whole would largely enhance the power of the great military empires. Earl Derby, in a despatch addressed to the British Ambassador at St. Petersburg, and which was communicated to all the other cabinets, while expressing a willingness on the part of Great Britain to unite in any measures which would actually tend to mitigate the personal hardships of warfare, and especially in those which would alleviate the condition of prisoners and the wounded, refused in very plain though very polite terms "to enter into any discussion of the rules of international law by which the relations of belligerents are guided, or to undertake any new obligations or engagements of any kind in regard to general principles." In particular, he demanded from Russia, as well as from all the other nations which should take a part in the conference, that it "would not entertain in any shape, directly or indirectly, anything relating to maritime operations or naval warfare." This pledge was at once given by Prince Gortchakoff in the most positive terms, and he even went so far as to declare that, "in general, the recognized

principles of international law will not be entertained by us nor brought forward for discussion." Most of the other governments returned a similar answer to Lord Derby's demands, although Germany and Italy replied that they would follow Russia. How far Prince Gortchakoff was strictly accurate in his sweeping assertion that "the recognized principles of international law would not be brought forward for discussion," will be seen from a review of the code which he prepared and proposed to the Congress for its adoption.

With most of its details we have at present no concern, and shall only refer to those portions which define the general rights and powers of belligerents. Its central principle is contained in the declaration that "operations of war must be directed exclusively against the forces and the means of making war of the hostile state, and not against its subjects." In this doctrine is found the humanitarian coloring which has proved so attractive to kindly theorists, and which has under its thin veil hidden from them the real injustice and hard absolutism of the code as a whole. The notion that war will be humanized by making it a duel between professional combatants—so that the success will always depend upon the possession of the largest and best equipped and best trained armies, and not upon the free spirit and fortitude of an entire people—is a favorite one with publicists of the Sentimental school and with unreasoning philanthropists. That it is a mistaken notion is shown by the fact that the only governments and statesmen who urge its general acceptance are those who most rely for security at home and abroad on a vast standing military force. Those wily and far-seeing men—the Gortchakoffs and the Bismarcks—perceive that in reducing warfare to a contest between professional soldiers, they will destroy at once the reliance of constitutional states upon the free activity of their citizens; they will force all nations in self-defence to adopt the policy of vast standing armies and a thorough military organization of their people. In this manner, the theory of war, which on its surface appears to be so mild and humane, and which by such appearance secures the advocacy of many professional reformers, is contrived to undermine and overthrow political institutions based upon civil liberty, and to strengthen those which rest upon force. Even the claim of a superior humanity in this mode of warfare is wholly without foundation. Reduced to its lowest terms, it is simply this: To kill or wound *men* called soldiers is more humane than to take or destroy the property of persons who are not soldiers. In other words, the name and condition of "soldier" places the *man* in the scale of humanity beneath the goods of the merchant or the crops of the farmer. This is the conclusion to which the modern Sentimental theory inevitably carries us. It is impossible to escape it by any subterfuge of argument, or to obscure it by any cloud of words. John Stuart Mill stripped it of all verbiage and placed it in its naked absurdity by one expressive sentence: "How war is to be humanized by shooting at men's bodies instead of taking their goods, I confess surprises me."

Adopting this central notion of war confined to the actual combatants, the code, of course, professes to respect private property, and enacts that "troops should respect private property, and in no case destroy it without pressing necessity." The utter worthlessness of this general declaration is evident when we turn to other sections of the same chapters. In addition to a sweeping permission given to seize and destroy everything that is necessary to the enemy, or may add to their strength, or that may hinder its own success, an invading army is authorized to exact for its own use from the population all taxes and public dues of every kind, and all articles necessary for its maintenance; but in the last case, indemnity, *as far as possible*, must be given to the losers. Even money contributions may be levied in cases of necessity, or by way of penalty; but, unless imposed as a penalty, the sums thus taken "*may be liable to restitution.*"

Here, for the first time in the history of modern public law, the uncontrollable, absolute, arbitrary power of the commander-in-chief of an invading army is legalized and made to receive the sanction of all civilized nations. Granting that all these acts are constantly done in modern wars, they have been suffered rather than justified, and a strong public opinion might produce some mitigation of their severity. This code, however, places them beyond the reach of opinion by conferring upon them a formal and universal sanction. The pretence that any indemnity or restitution is secured is too shallow to call for a criticism. The same hostile power which imposes the burden is made the sole judge of its extent, and all remedy is thus rested upon the enemy's discretion. To call this a legal redress is a simple perversion of terms.

The real design of the code is shown most plainly, however, in those portions which define the relations of an invading army with the population of an occupied district or territory. Its commander may maintain, modify, or suspend the local laws; he may compel the local civil officials, whether administrative or judicial, to continue the full exercise of their functions, and to perform on oath all such duties as may be required of them, and those who refuse or neglect to perform these duties may be prosecuted judicially. All public property, including even buildings, and also all railways and their rolling-stock, although belonging to private companies, may be appropriated. Citizens are forbidden to offer any opposition to the invaders unless they are fully organized as a portion of the national forces, and the inhabitants of an occupied district are prohibited under any circumstances from taking arms against their enemy. The dread penalty for a violation of the rule in either case is "military justice." Finally, all individuals who at one time take a part in military operations and at another return to their peaceful occupations, are treated as without rights and subjected to the same swift and inexorable punishment.

These few sections, selected from many others setting forth the same doctrines, show the animus of the proposed legislation. Under the specious pretext of confining war to the professional soldiery, it lays the heaviest of burdens upon all private citizens. As soon as the district in which they reside is invaded, all their natural allegiance is ended, and they must fulfil all their civil functions and duties, private or official, for the benefit of the enemy. Resistance is made a crime, and every endeavor in aid of country and government is made to be a violation of the international law. In short, all reliance upon the spontaneous action of its own citizens is denied to every state, and if it would maintain its independence and be able to resist external attacks, it must be prepared with sufficient armies and military organization. It is thus that, through the means of a Congress assembled to consult upon the laws of war, Russia and Germany would impose their own theories of government upon the nations of Europe, and, by the introduction of standing armies and a military organization as a necessary means of self-preservation into every state, would destroy the possibility of free institutions and constitutional governments. The first Congress at Brussels failed to accomplish these designs, and it seems to be expected that the one to assemble at St. Petersburg will be more pliant.

## OLD CATHOLICISM IN SWITZERLAND.

GENEVA, December 8, 1874.

OUR little republic has just passed through a critical election. The announcement need not startle any one; for the canton of Geneva (to judge from more than a year's close observation) is generally either on the eve of a crisis, or at the turning-point of a crisis, or just rallying after a crisis. Such a perpetual raging of tempests as goes on in this "tumbler of water" may be imagined by those who can conceive of a state of society in which not only municipal and State elections, but Congressional and Presidential elections, come every year; and in addition constitutional revisions and amendments, cantonal and federal, are frequently submitted to universal suffrage, and the periodical election of Protestant and Catholic ministers by popular ballot adds a vivacity of its own to local and general politics. The issue on trial at the late election was a religious one. Most of the recent elections have turned on religious questions. The cry of the triumphant party—the Radicals—was "The application of the laws," meaning the crowding of the Roman Catholics to the wall. On the other side was a feeble and hopeless wail of "Let us alone!" "No more harassing legisla-

tion!" "Quit inventing and engineering new state churches, and attend to the affairs of this life for a while!" The more sober and temperate Protestants, the little company of the disciples of Father Hyacinthe, and (in self-defence) the Ultramontane Catholics, combined their strength in opposition to the Radical party. But the vote of the latter was an overwhelming majority. For a year to come, it is settled that the utmost power of the canton, unrestrained even by an effective minority in the legislative and executive councils, is to be applied to the worrying out of the Roman Catholic clergy and faithful.

It must be acknowledged that the affair begins now to take a form approximating persecution. When the law for the election of priests by their parishioners was applied in the city of Geneva and its larger suburbs, the free-thinking Catholics went in for liberty with a shout and a rush, and elected their liberal priests by a vote which proved that it was the wish of a large majority of the born-Catholic population to repudiate the Roman hierarchy. But when it comes to the application of the same law in the Catholic country parishes, it is a totally different matter. The old parish-priests can be turned out of their churches and parsonages by tendering them an "iron-clad" oath, which they cannot in conscience take; and by the same process all priests in good and regular standing with the Roman hierarchy can be made ineligible to the position. But the law requires that no election of curé shall be valid unless at least a quarter of the registered Catholic vote of the commune is actually cast, on one side or the other; and when, a few weeks since, an election for curé was held at the rural parish of Grand Saconnex, the villagers were able to defeat the choice of a liberal curé by simply staying at home. The number of persons who could be persuaded to vote at all fell far short of the requisite one-fourth. But the root-and-branch men, who have complete control of the affairs of the canton for another year, give notice that they do not mean that "the application of the laws" shall stop there. By hook or by crook—most likely by the latter—not only are the Ultramontane clergy to be dispossessed, but the churches, parsonages, and salaries are to be transferred to a new clergy, detested by their parishes, disowned by bishop and pope, but in full fellowship with M. Carteret and the rest of the Protestant council of state.

Meanwhile, the religious Protestants, a large proportion of whom considered the democratizing of the Catholic Church a clever stroke of politics, have been disgusted by an application of almost the same law, word for word, to the National Protestant Church. According to the new statute, the sole condition of becoming a pastor of the old church founded by John Calvin is to pass examination at the university, or give some equivalent proof of scholastic training, and then get a majority of the universal suffrage of the Protestant community. No ordination is required, there is no test of orthodoxy, there is no enforced liturgy nor catechism, and there is no limitation whatever on the subjects of which the preacher shall speak, nor on his manner of treating them. There is nothing to hinder a Jewish Rabbi from becoming a minister of the state church if he can get votes enough. In fact, I regard it as highly probable that the learned and eloquent Grand Rabbi Wertheimer may some time be invited to be one of the preachers from the old chair of John Calvin. Of course, all the old Protestants, of any earnestness of religious conviction, are getting ready to quit the church of their fathers, declaring that it has ceased to be a Christian church; and all persons of the slightest political forecast are looking for the speedy and complete dissolution of all connection between church and state. No sentiment is more sure to "bring down the house" at a popular religious assemblage, than a prediction of the early adoption of the American system in Geneva and in all Europe. I told Dr. Joseph P. Thompson the other day—whose useful little book on 'Church and State in America' is undoubtedly having an important influence on public opinion in Europe—that I was sorry it did not contain one candid chapter on the drawbacks and failures of the American system. He told me that the edition now preparing by that clever young statesman, the Marquis of Gonzaga, for circulation in Italy, would have such an addition. If these people will try our experiment, as I hope, we are bound to do what we can to save them from our mistakes and incidental evils.

Father Hyacinthe has at last organized his separatist worship, thus dividing the "National Catholic Church" of the city of Geneva. He announces, in a little manifesto, that as soon as the Liberal Catholics of Switzerland complete their organization by the choice and institution of a bishop, he shall tender his submission and obedience to the new prelate, *if*——.

On the whole, I am slowly and reluctantly making up my mind that this Old-Catholic movement is not going to have much of a future. Here, in this canton, it has had a noble, sincere, though not very sagacious leadership in its clergy, but a most scurvy though numerous following of small politicians, unscrupulous and irreligious. In the Bernese Jura there has been a sort of drumhead Reformation, under the main direction of M. Bodenheimer, Protestant Minister of Public Instruction. I will not deny that Bodenheimer is a pretty fair makeshift Catholic bishop, and has done the best in his power for his flock. But his best efforts to recruit a new clergy for his diocese of sixty-nine parishes, even with the most moderate regard for validity of ordination, have resulted in bringing together from the contiguous countries a scanty supply of men of doubtful quality. But these have, practically, no parishes. For it is a pretty well-established fact that the Liberal Catholic, although he will turn out with alacrity on election day to vote against the clergy, will not go to church except under stress of some unusual combination of motives; and, further, that the Liberal Catholic's wife and children will, generally, go to the Ultramontane worship unless he does something to stop them.

Further north, in German Switzerland, there does seem to be a somewhat greater depth and reality to the Old-Catholic movement; and if the scholar-like and pious Professor Herzog, of Olten, should really become the Swiss bishop, as is proposed, he will do much for the character and success of the movement. But the difficulty with it, both there and in Germany, is that it is a movement that does not move. It begins in the universities, and never travels far beyond them. Instead of pushing and propagating their principles, the Old Catholics are content with making their protest, demanding their rights, and waiting on Providence. Their feeling is profound and almost religiously earnest that there is no knowing what may turn up when the Pope dies. When the Pope dies. Have you ever thought professionally what a heading that would make for a magazine article; and what a good thing some bright fellow with a talent for vaticination might make of it? But meanwhile that aggravating old man shows no disposition to gratify the public interest as to what will come next; and some of the best of the Old Catholics, like Hyacinthe, are among those who pray most sincerely for the Pope's health and long life, saying that no one else could possibly help on their reform half so effectively as Pius the Ninth himself.

The new federal constitution, adopted this year, begins to take hold like a mustard-plaster. The whole character of the debates in the federal legislature has undergone a change in consequence of the effective transfer to it, from the cantons, of most of the chief functions of government. Instead of holding, as heretofore, far less proportionate authority than the Federal Government of the United States, the federal authorities at Berne now hold control of all civil law, all commercial law, all military and postal organization, leaving to the cantons nothing but a part of the penal legislation and an imperfect control of their own police. For three or four weeks past the main subject of study has been a bill for regulating marriages, funerals, and the registration of births and deaths. It seems strange to our notions of federal government to see the central authority busy in regulating the order in which the sexton shall dig the graves in a village burying-ground, and the conditions of the marriage contract, and who shall keep the parish register. But there is an explanation, if not a reason, for all this, in the excess of state-rights with which the people have been annoyed until now. The hindrances to marriage, and even to the decent burial of Protestants in Roman Catholic cantons, have been swept away, with the hearty consent of those cantons themselves, by turning the whole matter over to the federal authorities, who will regulate it in detail by a general law, doubtless excluding all the clergy from any official participation whatever in any civil transaction. And, when you once think of it, it is a fair question whether in the United States there is any point at which we really suffer more for lack of uniformity of law than in the matter of marriage, in which one State is at liberty, through bad legislation, to make itself a nuisance to all its neighbors. Too much State-rights, on a matter so vital to society, may sometimes bring us, as it seems to have brought the Swiss, to an excess of centralization. But what may be tolerable and even salutary in this little confederacy might be fatal to our great organism.

# Correspondence.

## MANUAL LABOR AT HAMPTON.

To the Editor of The Nation:

Sir: To the discussion of manual-labor systems which you notice in your issue of December 10, there is still something to be added; and a statement of the facts which prove, in opposition to the experience of Cornell University, that the manual labor of students can be made practically successful, may throw some light upon the conditions of such success. The

experiment which has been made in the Normal and Agricultural Institute at Hampton, Virginia, during the past six years, is of great practical value to the South, and should be of at least indirect interest to Northern educators; for it includes the severe test of a somewhat complicated manual-labor system, and the proof that such a system may be made a valuable adjunct to the resources of a college, a majority of whose students are impecunious. If manual labor is a failure at Cornell and a success at Hampton, it is certainly worth while to discover the reasons for these different results, in order to obtain data for future work and to avoid the costly repetition of demonstrated mistakes.

In your note upon the Cornell system, you mention some of the principal causes of its acknowledged failure, and these chance to be salient points of difference between it and the Hampton system, some being inherent and inevitable differences, while others are the accident of circumstance and surroundings. A primary difficulty at Cornell seems to have been that the system required of the students a "rare amount of constancy, fortitude, and self-restraint." Now, in Hampton, all the students are manual laborers, and the required constancy, fortitude, etc., being simply the habit of their lives, are not consciously elevated into the rank of virtues. The students are, furthermore, assisted by the knowledge that their work is educational, has results both in the present and the future, and directly affects their standing in the college. The demand which their work makes upon them is taken as a matter of course, and they are stimulated by understanding that they are ranked not only according to the spirit in which they deal with books, but also according to the spirit in which they deal with the appliances of physical labor. Their manual labor is made a necessary and an honorable thing. Then, too, the natural dislike to the coarser forms of work is met by putting the students, so far as possible, at work of which they can themselves see the value, work which teaches them something, whose completion leaves them wiser and more helpful, and whose connection with more highly developed forms of labor is evident.

Competition of course exists, and student labor, in order to be of substantial assistance to individuals, must, estimating it at its true value, necessarily be overpaid in comparison with current rates; but although this lessens the profits, it by no means annihilates them. At Hampton there is also the disadvantage (if it be a disadvantage), caused by the general stagnation of the South, of a glutted labor market. The college must perforce, at all times and seasons, provide its students with work, as there is absolutely no demand for their labor outside the college walls; but while this is a frequent cause of perplexity to the college officials, it undoubtedly affords protection to the students, by keeping them constantly under the beneficial control of college regulations.

The irregularity of students who are also manual laborers is an obstacle which remains always and everywhere insurmountable. The most that can be done is to transform it into organized irregularity, and make an allowance for it in the academic classes. In the Hampton system it has been found that by a careful arrangement of the working hours, thorough reviewing on the part of the teachers, and a good deal of personal pressure, the students can be saved from any essential loss. A student who spends one-quarter of his school hours in labor need not, by any means, lose the same amount of time in his studies. As to the complaint made in the Cornell report of the dishonesty of students, Hampton has a somewhat remarkable record to offer. During the past six years the officers have not discovered a single case of intentional misstatement in regard to labor performed, or any attempt to garble accounts. The negroes, finding themselves for the first time treated as trustworthy and responsible agents, develop a curiously strict sense of honor, which may or may not prove to be the result merely of their novel position. Their friends do not claim that this apparent trustworthiness is likely to be a permanent characteristic, but state the fact as they at present find it, for it to some extent simplifies the official machinery and is undoubtedly one of the factors in the problem.

The total amount expended in the payment of students (both male and female) during the past five years at Hampton, is something over $25,000, the rates being from five to eight cents per hour for agricultural and household labor, and from ten to twelve cents for mechanical; and it is noticeable that, instead of the falling-off experienced at Cornell, the Hampton books show a steady increase of from $3,833 in 1870 to $6,270 in 1874. In short, the manual-labor system has thus far worked so well at Hampton that the authorities of the Institute do not hesitate to hazard the opinion that, given a class of students of whom a large proportion have felt the pressure of poverty, and know the value of their opportunity, manual labor, under ordinary conditions, can be made in every sense profitable.

M. F. A.

New York, December 26, 1874.

## BISMARCK'S HUMANITY.

To the Editor of The Nation:

Sir: Allow me to call your attention to an error in the letter of your Paris correspondent which was published in last week's *Nation*. Bismarck did not write, while speaking of the drama of the Commune: "A thing which I do not desire *for humanity's sake*." His exact words were: "Was ich aus *menschlichem* Interesse nicht wünschen will." *Menschlich* here means humane, and Bismarck means to say: his own humane feelings, his humaneness, does not allow him to wish for a repetition of those horrid events, even if it would be desirable from a political point of view. Your correspondent, therefore, would not have had any reason at all to *shudder* at Bismarck's atrocious hatred of the French nation, if he had understood the true meaning of Bismarck's words.

I am sure your well-known sense of justice will not allow you to leave the American people laboring under the wrong impression of Bismarck's character which such an interpretation of his words as that of your correspondent must necessarily have produced.—Very respectfully yours,

Edw. Althaus.

110 East Twenty seventh St., New York, Jan. 10, 1875.

# Notes.

THE American reprint of Livingstone's 'Last Journals' will be by Harper & Bros.——D. Appleton & Co. have reprinted in full the Greville Memoirs.——Scribner, Armstrong & Co. secure Mr. George Smith's account of his recent discoveries at Nineveh.——G. P. Putnam's Sons publish James Martineau's 'Religion as Affected by Modern Materialism.'——Roberts Bros.' list for the coming season includes one American book—Rev. W. C. Gannett's life of his father, the late Dr. Ezra Styles Gannett; and the following authorized reprints: Earl Russell's 'Recollections and Suggestions of Public Life (1813–1873)'; Helps's 'Social Pressure'; 'Our Sketching Club,' by R. St. John Tyrwhitt; a boys' story, 'Harry Blount,' by Philip Gilbert Hamerton; and 'A Rambling Story,' by Mary Cowden Clarke.——No. I. of the natural-history publications of the U. S. Northern Boundary Commission is on the Muridæ, by Dr. Elliott Coues, U.S.A. ——The '*Tribune* Almanac' for 1875 is as usual full of political statistics convenient for editors and voters, while the farmer may profit by the tables of trade and commerce, of canal and railroad transportation, and of the wheat market of the world. Misbehaving Senators and Representatives find here their shabby record as to "six important financial propositions involving the question of inflation"; and the slipshod legislation of the last session is summarized or given at length.——Berlin has reached that stage of metropolitan growth where the peculiar pabulum known as an "American" newspaper seems a necessity. The *International Gazette* has been endeavoring for months to supply the supposed need. It is said to have met with some success in obtaining circulation among settled Americans. The numbers we have seen do not indicate any intention to rival the *Anglo-American Times*, or even, which is saying a good deal, to equal the *American Register* of Paris. Of course, *Galignani* is, without doubt, the best English paper on the Continent, but it pretends to no independent existence. The *Anglo-American Times*, of London, has long been the best publication intended to meet the wants of Americans travelling or sojourning abroad. From this to the *Register* (despite some improvement the last year or two) and the *Swiss Times* the gap is huge. We are speaking only of the literary merits of these papers. The advertisements and purely local information or "hints" have in each a special value of their own.

—The accounts given by the newspapers of the new kind of volunteer winter Commencement held at the Academy of Music last Thursday evening, differ in some respects. According to the *Tribune*, "the first intercollegiate contest, whether considered with reference to the ability of the work which it evoked, or the character and numbers of the audience gathered to witness it, or the enthusiasm which was displayed, proved a much more marked and significant success than even the best friends of the undertaking had anticipated." The *Herald*, on the other hand, dismissed the subject with a good deal of hauteur, declaring that "the whole thing" was "a dreary exhibition of mediocrity," maintaining that the young men would have been better employed elsewhere, and that "even the winner of the first prize in oratory only won because he forgot himself, and was natural in his delivery during a part of his speech." In his description of the evening's entertainment, too, the *Herald's* commissioner gives evidence of a praiseworthy but excessive tendency to set up a high standard for the estimation of literary performances of this kind, expressing

grave doubts whether good reason can be assigned why, on the evening of the seventh of January, in the year of grace 1875, an audience should be assembled in the principal opera-house of the country to hear one young gentleman of tender age discoursing upon "Independent Thought," or another telling the tale of "The Good King of the North," or a third analyzing "The St. Simeon Stylites of To-day." We are inclined to fear that if this keen and searching kind of criticism were brought to bear even upon the midsummer and orthodox commencements, they would hardly be found to bear the test, and, after all, the principal difference between a commencement of the old and of this new kind is probably that one is a college exercise, properly so-called, with a merely local public to encourage the contestants, while this gives to literary intercollegiate rivalry the same kind of glare of general publicity which boating secures for the athletic interest in the summer.

—We may, however, be allowed, "without seeming invidious," as the reporters say, to give one powerful reason why literary intercollegiate rivalry can never have the interest which attaches to the boat-races, viz., that the boats are pulled by men who are, for this work, in their very prime and flower, and from whom, in the matter of strength and endurance, no improvement need be looked for during the rest of their lives. In short, from the athletic point of view, they are perfect men. On the other hand, the intellectual performances of undergraduates are those of very immature persons, whose rhetorical efforts are apt to be merely imitative, who will not be at their best for ten or twelve years to come, and who have nothing to say on any subject which possesses real interest for the spectators. And we may add, that we think the appearance of undergraduates in the middle of the college session to recite essays in a city theatre, on subjects which have no special relation to the studies in which they are actually engaged, and before judges who, however competent, have not been selected by the college authorities, must be considered a performance of very doubtful utility with reference to its disciplinary influence, in the best sense of the term. This objection, it is true, is not applicable to contests in mathematics or other scientific subjects, which are now proposed, but to make these really intercollegiate, the competitors should really represent their colleges as regards excellence, and whether they did so or not could only be ascertained by a preliminary collegiate examination; but how would this comport with the sober and fruitful pursuit of the regular college course?

—The representation of colleges at this contest was by no means numerous, and was indeed confined to Cornell, Princeton, Williams, the University of New York, Rutgers, and Lafayette; and the absence of Harvard and Yale was of course noticeable. Whether they intend to take part in the contests of next year (which are to include competitive examinations in Greek and mathematics) seems as yet undecided, and meanwhile the smaller colleges probably take a wicked satisfaction in reflecting that, whether owing to their absence or to some other cause, this contest has not, like some others, ended in accusations of fraud directed against the judges, nor even have any of the orators or essayists entered a claim, as yet, of a "foul." No doubt, one reason why neither Harvard nor Yale took any part in the contest this year is that in both colleges the oratorical fever—the thirst for declamatory distinction which a generation ago seemed to seize upon every American boy at a certain age like an irritating epidemic—is a thing of the past; the time has come when at Harvard a reaction has set in of a very decided character. So strong, indeed, has the anti-oratorical current begun to run in that college that among recent graduates the reputation for a precocious ability for speech-making is not at all enviable—a fluency of political tongue having become associated in the minds of observant youngsters with hypocrisy or a general lack of sincerity. Lately, this healthy reaction has been carried pretty far, and has inclined some persons to fear for the total extinction of American oratory—an event which we, for our part, in no wise anticipate so long as there are people to persuade and halls in which to persuade them. The next meeting of the Intercollegiate Association will be watched with a good deal of interest, particularly as it is now, through the liberality of Mrs. J. J. Astor and Mr. Dwight H. Olmstead, supplied with funds to a considerable amount. One of the curiosities of the discussions of this year was a proposition for a great collegiate inter-State national contest at Philadelphia during the Centennial, which, we are glad to say, was voted down after a lively discussion. The judges on Thursday evening in oratory were Messrs. W. C. Bryant, G. W. Curtis, and Whitelaw Reid; in essays, T. W. Higginson, James T. Fields, and Richard Grant White.

—The Paris Geographical Society has been arranging for an International Geographical Congress. The answers from foreign governments and societies have been so favorable that a definite programme has been drawn up and issued. The congress, in connection with an exhibition of instruments, maps, books, etc., bearing upon geography, will open on the 31st of next March. The sessions will continue not more than ten days. The Society has proposed 123 questions for discussion in the seven divisions, to one of which each visitor will be assigned as he may designate on announcing his intention to be present. The groups are: 1. Mathematical Geography. 2. Hydrography. 3. Physical Geography, including Botanical and Zoölogical Geography and General Anthropology. 4. Historical Geography; Ethnography and Philology. 5. Economical Geography (*i.e.*, the problems of emigration and the use of emigrants in obtaining new information); Commercial and Statistical Geography. 6. The Teaching of Geography. 7. Travels. There are corresponding departments for the articles which are to be exhibited. This exhibition will continue at least a month. Each Government appoints a director who cares for the exhibitors of that country, and to him all announcements of participation are to be made. The French members of the Society who arrange the details of the congress are: President, Vice-Admiral Baron de la Roncière le Noury; General Commissioner Baron René Reille; General Secretary of the Geographical Society, Charles Maunoir. All suggestions of new questions and proposed changes of those announced, as well as all memorials and notice of intention of speaking, are to be sent to M. le Baron Reille, commissaire général, 10 Boulevard Latour Marbourg.

—Herr Niemann, the genealogical editor of the *Almanach de Gotha*, appears not to have heard of the criticism excited last year among the Italians by his novel addition to the account of their sovereign. In the current issue of the *Almanach* (which comes to us from B. Westermann & Co. and F. W. Christern), he retains the entry concerning the morganatic marriage of Victor Emanuel with Rosina, Countess of Mirafiore, merely altering the name to Rosa Vercellana. The protestations of the Foreign Office, therefore, if any were made, were without effect, and it is perhaps as much a secret as ever who prompted the editor to record the left-handed alliance. Other noticeable aspects of the *Almanach* for 1875 are the unusual changes in the diplomatic and statistical matter—for example, in the military data of Great Britain, France, Italy, Austria, Russia, and Turkey, owing to the reorganization of their systems; and the preponderance given to financial statistics, in accordance with the policy of alternation adopted for successive editions in view of the superabundant material at the command of the statistical department. The notice of Spain is confined exclusively to the personnel of the Government and its representatives abroad. No prominent name occurs in the necrology of royalty for 1874. The portraits of the living include Marshal MacMahon, the Duke and Duchess of Edinburgh—a pair of whom striking beauty cannot be predicated in spite of the engraver's good intentions—and the pretty young Archduchess of Austria, once the Infanta of Portugal, by name (much abbreviated) Maria Theresa.

—In the last number of Kolbe's continuation of Erdmann's *Journal für praktische Chemie*, issued in November, 1874, though bearing the inscription No. 20—1873, we find a chemical review of the year 1873 by the editor. The Leipzig professor finishes his review in a short paragraph, remarking that there have been no important discoveries, but that other occurrences will weigh so much the more heavily upon all chemists who have their profession at heart. With a brief allusion to Liebig, whom he reserves for the succeeding article, he launches his diatribe against the new chemistry. He feels that the time has come for him to speak out. For some years, he declares, chemical research in Germany has been going backwards, and German "Gründlichkeit" has given place to superficialness and one-sidedness. The chemical journals contain many articles, but very few of any depth or originality—"Arbeiten nach einer Schablone." Young chemists, nowadays, care only for work which promises to lead to something new; they are poorly educated, get to work early, and are declared to be useless by the directors of factories where they are employed. The blame of most of this lies at the doors of the "so-called modern chemistry." This new theory, really nothing but an imposing hypothesis, misleads by the plausible explanation it offers for all that happens. The new chemist, who knows exactly how a molecule looks at both ends and in the middle; who knows all about the ortho-, meta-, and para- arrangements, and even tries to determine the very place of an atom in a molecule (in which, by the bye, the "moderns" declare they have been wonderfully successful of late), is no longer on solid ground. The "Naturforscher" has become a metaphysician. Kolbe then impressively warns all defenders of the new chemistry—he "who for thirty years has held fast to the 'Typentheorie,' and has built it out according to his needs, in preference to tear-

ing down preparatory to building anew." This comparison is unlucky. A theory or a hypothesis is not a house to contain facts, nor built of the facts. It were better compared with the child's endeavor to put its colored blocks together according to a pattern—only the child is a big child ; there is a doubt about the number of the blocks, and the pattern is lost, though we believe the theologians are thought to have a copy. The professor next vents his rage upon the German Chemical Society of Berlin—a monster created by the new chemists—the name "German" especially arousing his apparently Particularistic ire. This society was for a time doubtless somewhat free in its terms of membership, but is improving. At all events, the charge that it has been conducted for personal ends seems a little hard. Kolbe's especial complaint is against the honorary election of Wurtz, in which he finds an insult to the memory of Liebig. The rest of the number, excepting one page, is devoted to Liebig, and contains a sketch of his life and work, with reflections by Kolbe, and articles on his relation to agricultural and physiological chemistry by Strohmann and Neubauer. In fact, the number ought to be dedicated to the memory of Liebig, who, we may remark, promises in his way to occupy a shibbolethic position not unlike that long held by a renowned general and president among us. We say this without wishing in any way to depreciate the distinguished services he rendered science.

—We have alluded to this article as containing not only a curious example of the *odium chemicum*, but because of its suggestiveness in another aspect. The tirade against the new chemical philosophy we may leave to the chemists. The Chemical Society will doubtless be able to take care of itself, and perhaps of Mr. Wurtz too. As to what Prof. Kolbe says about students of chemistry, it is probably only too true—even in Germany. Its truth as regards some other countries has been only too well known. Grand as is the recent progress of chemistry—particularly that of the carbon compounds, and this because of the new theory and not in spite of it—the training of students of chemistry has suffered. The ease with which brilliant results may be obtained has led students away from the more difficult problems. Here probably the German training, excellent as it is, is weakest. Had Prof. Kolbe confined his attention to this point, and elaborated it, instead of burying it in his majestic abuse of other things, he would have found a readier hearing. It is, however, curious that Prof. von Sybel, in his address on Founders' Day (August 3) at Bonn (reprinted with the edition of his 'Die deutschen Universitäten'), makes a similar complaint concerning students of history. He finds them too ready to take little-worked departments of research which promise rapid though worthless results, rather than view work as training. Prof. Mommsen, too, in his rectorial speech at Berlin, expressed himself in a similar way, laying weight upon the time spent at the university as a time of training. This shows that the materialist hurry which characterizes American life and to some extent American culture, and for which our German cousins have been wont to abuse us, is not unknown among them. In other words, German nature is human nature too, and upon opportunity shows its likeness to its fellows. Such an opportunity the new historical school and the newer chemical school have offered to their students.

—An ingenious arrangement for a Latin vocabulary has been devised by Dr. Sanneg of Luckau. In place of the usual alphabetical order, which begins with the first letter of the word and goes from left to right, the words defined are arranged in their alphabetical order as spelt backward from right to left. This arrangement will be clear from the two columns below : the first gives the words in the usual alphabetical order, the second in Sanneg's inverted order :

| | |
|---|---|
| FABA, horse-bean. | I. *Adv.* around. CIRCA |
| FABACEUS, of a horse-bean, horse-bean-. | II. *Prep. w. Acc.* around, about. *Adv.* there. EA |
| FABAGINUS, of beans. | *Adv.* in company, together. UNA |
| FABALIS, of beans. | I. *Adv.* below. INFRA |
| FABARIS, a river in the Sabine country. | II. *Prep. w. Acc.* below. I. *Adv.* above. SUPRA |
| FABELLA, a short story, a short play. | II. *Prep. w. Acc.* above. |

The custom of reading from left to right is so ingrained that some practice would be required to read, like Macaulay's "thirty chosen prophets," as if the words were "Traced from the right on linen white," namely, *circa* as *acric*, *ea* as *ae*, *una* as *anu*, etc., and the proposed method never can supersede the common one. But the immense usefulness of a book of words grouped in the order of the endings as a supplement to the common dictionary, is obvious. We have always insisted that the study of the derivation and formation of words, which is finished up in a page or two of the Latin grammar, deserved very much more attention than it receives. At the same time, there are great difficulties in the way of pigeon-holing the words, when once we get beyond the commonest suffixes. A boy turned loose among Roby's lists would find himself in a perfect labyrinth ; while Sanneg's arrangement would furnish him with an Ariadne-clue to guide him out of the tangled maze ; for example, he could run his eye at a glance over all the words ending in *-mentum*, *-osus*, *-io*, *-tio*, etc. In fact, a simple list of the Latin vocabulary arranged in this order, even without definitions, would be as useful to the student of language as a table of anti-logarithms is to the computer. We shall be very glad to welcome such a work, and if it is carried out we promise to give it an extended notice.

—Brockhaus has recently published in his series of Italian authors ('Biblioteca d'autori italiani') the first volume of a new edition of Dante's Commedia, edited and commented by G. A. Scartazzini, already favorably known to Dantesque students by his book, published in 1869, entitled 'Dante Alighieri, seine Zeit, sein Leben und seine Werke.' The volume before us, an octavo of four hundred and fifty closely printed pages, contains the 'Inferno,' and is remarkable for the same care and fine typographical execution which distinguish the rest of the series. The editor has given on all important passages the opinions of the most celebrated ancient and modern commentators, besides the results of his own extensive studies in this field. Hence this edition will not only be of value to beginners who have mastered enough of the language to use with ease an Italian commentary, but more advanced scholars will find it very convenient as giving a résumé of many volumes. Nowhere could more amusing instances of the intolerance of men of letters be found than among commentators on Dante. Biagioli allowed himself to call Padre Venturi "an infamous, dirty dog" (*sozzo can vituperato*), and was in turn termed "an inurbane grammarian" and "a most ungrateful ingrate." Scartazzini, we are sorry to say, cannot resist the temptation to abuse Scarabelli of Bologna, whom he calls "an ignorant, harebrained, and unconscientious editor," "*quel tal* Scarabelli," and "*dottorone*." On this subject it will be interesting to hear what Scarabelli has to say in his next work on Dante.

—While Ariosto has been translated into seven Italian dialects, and Tasso into nine, Dante has not yet been completely translated into even one. Various cantos have been translated with greater or less success into the dialects of Milan, Naples, Verona, Venice, Chioggia, and Padua. In addition to these, we learn from a late number of the *Athenæum* that Francesco Limanzi, a local judge, has just successfully translated the 'Paradise' into the Calabrian dialect. There is surely no reason why the peasants of that wild region should not be as much interested, in case the translation is continued, in the episodes of Francesca di Rimini and Count Ugolino, as the Venetian gondoliers in Armida and Rinaldo or Tancred and Clorinda. Before passing from Dante, we may mention a pamphlet by Dr. Johannes Jacob on the import of Dante's guides in the other world, Virgil, Beatrice, and St. Bernard ('Die Bedeutung der Führer Dante's in der Divina Commedia,' Leipzig), with relation to the ideal aim of the poem and the mental development of the poet. This little work shows what excellent results can be obtained from the system of explaining Dante by Dante—a system partially adopted by many commentators, but most completely carried out by Giuliani of Florence in his admirable comment entitled 'Dante spiegato con Dante.'

—At the beginning of this century the publication of the 'Vision' of Frate Alberico, a monk of Montecassino, aroused a lively discussion as to the originality of Dante's 'Commedia.' Since then, Ampère, Labitte, and others have collected and illustrated the various legends and visions current during the Middle Ages, and even earlier, which throw light upon the great poem. The latest contribution to this subject is from the pen of the well-known Italian scholar, Alessandro d'Ancona, and is entitled 'I Precursori di Dante' (Firenze, 1874). The author skilfully arranges and classifies the extensive material collected by his predecessors in this field, and comes to the conclusion, which will be readily received, that Dante's originality did not consist in the form of his poem, but in the consummate art with which he managed it.

## NORDHOFF'S COMMUNISTIC SOCIETIES.*

MR. NORDHOFF offers us here a copious volume on a subject deserving of liberal treatment. His researches have been minute and exhaustive, and he makes a very lucid and often an entertaining exposition of their results. He writes in a friendly spirit and tends rather, on the whole, to dip his pen into rose-color ; but he professes to take the rigidly economical and not the sentimental view; and certainly the Rappists and the Shakers, the

* 'The Communistic Societies of the United States, from Personal Visit and Observation, etc. By Charles Nordhoff.' With Illustrations. New York: Harper & Brothers. 1875.

Perfectionists and the Bethel people, make their accounts balance with an exactness very delightful to a practical mind. It would have been possible, we think, for an acute moralist to travel over the same ground as Mr. Nordhoff and to present in consequence a rather duskier picture of human life at Amana, Mount Lebanon, and Oneida; but his work for our actual needs would doubtless have been less useful. Mr. Nordhoff, too, has not neglected the moral side of his topic, and much of the information he gives us has an extreme psychological interest. His purpose, however, was to investigate communistic life from the point of view of an adversary to trades-unions, and to see whether in the United States, with their vast area for free experiments in this line, it might not offer a better promise to workingmen than mere coalitions to increase wages and shorten the hours of labor. Such experiments would be worth examining if they did nothing more for the workingman than change the prospect ahead of him into something better than a simple perpetuity of hire—a prospect at the best depressing and irritating. "Hitherto," says Mr. Nordhoff, "very little, indeed almost nothing definite and precise, has been made known concerning these societies; and Communism remains loudly but very vaguely spoken of, by friends as well as enemies, and is commonly either a word of terror or contempt in the public prints. . . I desired to discover how the successful Communists had met and overcome the difficulties of idleness, selfishness, and unthrift in individuals, which are commonly believed to make Communism impossible. . . . I wished to see what they had made of their lives; what was the effect of communal living upon the character of the individual man and woman; whether the life had broadened or narrowed them, and whether assured fortune and pecuniary independence had brought to them a desire for beauty of surroundings and broader intelligence; whether, in brief, the Communist had anywhere become more than a comfortable and independent day-laborer, and aspired to something higher than a mere bread-and-butter existence." As to some of these points, the author must have been satisfied at an early stage of his researches: beauty of surroundings and breadth of intelligence were nowhere striking features of communistic life. This life was everywhere, save at a very few points, nakedly practical; and at these exceptional points, as in the case of the "spiritualism" of the Shakers, their celibacy, in a measure, as well, and in that of the interchangeableness of husbands and wives in the Oneida Community, the ideal element is singularly grotesque and unlovely. The Shakers and the Perfectionists have certainly not been broadened; whether they have been narrowed or not is a different question. Mr. Nordhoff inclines to believe not, and he constantly reminds us that, in judging the people he describes, we must be careful that we do not compare them with a high ideal. They are for the most part common, uneducated, unaspiring, and the question is whether they are not, for the most part, more complete and independent than if they had struggled along in individual obscurity and toil. They are certainly more prosperous and more comfortable, and if their ignorance has often hardened into queer, stiff, sterile dogmas, the sacrifice of intelligence has not been considerable. Even the Shakers have, indeed, a sort of angular poetry of their own, and the human creature for whom it was a possibility to become a Shaker doubtless wears in that garb a grace which would otherwise have been wanting.

Mr. Nordhoff's field was extensive, stretching as it does from Maine to Oregon, and southward down to Kentucky. It contains some eight distinct communistic societies, but these are composed of a large number of subdivisions; the Shakers alone having no less than fifty-eight settlements. Mr. Nordhoff begins with the Amana Society, whose present abode, or cluster of abodes, is in the State of Iowa. Like most of its fellows, with the exception of the Perfectionists and Shakers, this commune is of German origin. It established itself in this country in 1842; it contains something less than fifteen hundred members; it possesses twenty-five thousand acres of land; it has a rigidly religious character; it allows marriage, but keeps the sexes as much as possible apart, and thinks rather poorly of women. It supports itself by farming and by the manufacture of woollen stuffs; "lives well after the hearty German fashion, and bakes excellent bread"; has, indeed, at some seasons of the year five meals a day; keeps its affairs in very prosperous order, and finds an eager market for its produce of all kinds. Religion here, as in most of the communities, is of a strictly ascetic sort; they seem generally to find it needful to be girded up by some tight doctrinal bond. "Inspiration" is the *cheval de bataille* at Amana; the ministers, male and female, are called "instruments"; "the hymns are printed as prose, only the verses being separated." This congregation seems to have produced upon the author a strong impression of easy thrift, of the "well-to-do." Even better in this respect are the Rappists or Harmonists at Economy, near Pittsburgh. "Passing Liverpool, you come to Freedom, Jethro (whose houses are both lighted and heated with gas from a natural spring near by), Industry, and Beaver." You must feel yourself to be on the native soil of social experimentalism, and have a sort of sense of living in a scornfully conservative parody or burlesque. The experiment of Father Rapp, however, who came to America in 1803, and to this region in 1825, has been a solid, palpable success. The Harmonists, who number one hundred and ten persons, hold property to the amount of between two and three million of dollars. Mr. Nordhoff makes a point of the importance, in communistic ventures, of a strong-headed, strong-handed leader; and this, indeed, with a very definite religious tendency, seems essential to success. The Harmonists had both; and Father Rapp, the Moses who led them out their house of bondage (the kingdom of Würtemberg), seems to have been a man of excellent sense and energy. He died in 1847, and, though he has had successors, the society is resting on its gains, making few recruits, and awaiting, in a sort of eventide tranquillity and security, the second coming of Christ. The Rappists are celibates; and that the institution has been successful with them may be inferred from Mr. Nordhoff's remark that he has "been assured by older members of the society, who have, as they say, often heard the period described by those who were actors in it, that this determination to refrain from marriage and from married life originated among the younger members."

One is struck, throughout Mr. Nordhoff's book, with the existence in human nature of lurking and unsuspected strata, as it were, of asceticism, of the capacity for taking a grim satisfaction in dreariness. One would have been curious to have a little personal observation of these "younger members" who were so in love with the idea of single blessedness. "The joys of the celibate life," says one of the author's Shaker informants, "are far greater than I can make you know. They are indescribable." The Shakers, on this point, go further than the Catholic monks and nuns, who profess merely to find celibacy holy, and salutary to the spirit—not positively agreeable in itself. Mr. Nordhoff found in a Shaker Community near Rochester several French Canadians of the Catholic faith, and in another in Ohio several more Catholics, one of whom was a Spaniard and an ex-priest. A French Canadian Shaker strikes one as the most amusing imbroglio of qualities conceivable until one encounters the Spanish priest. One wonders how ineffable *they* deemed the joys of celibacy. At the village of Zoar, in Ohio, the author found a community of three hundred persons, of German origin, calling themselves "Separatists," owning "over seven thousand acres of very fertile land," together with other property, representing more than a million of dollars. "The Zoar Communists belong to the peasant class of Southern Germany. They are, therefore, unintellectual, and they have not risen in culture beyond their original condition. . . . The Zoarites have achieved comfort—according to the German peasant's notion—and wealth. They are relieved from severe toil, and have driven the wolf permanently from their doors. More they might have accomplished; but they have not been taught the need of more. They are sober, quiet, and orderly, very industrious, economical, and the amount of ingenuity and business skill they have developed is quite remarkable. Comparing Zoar and Aurora with Economy, I saw the extreme importance and value in such an experiment of leaders with ideas at least a step higher than those of their people." The Zoarites disapprove of marriage, but they permit it, which seems rather an oddity. "Complete virginity," say their articles of faith, "is more commendable than marriage." It is also, of course, more economical, and, though the Communistic creeds generally do not say this, it is pretty generally what they mean. At Bethel and Aurora, however, two German Communes of four hundred members apiece, in Missouri and Oregon respectively, Mr. Nordhoff found marriage not discountenanced, and affairs in general fairly prosperous. Of Dr. Keil, a Prussian, the head of the society at Aurora, Mr. Nordhoff gives an interesting account. He had been a man-milliner in his own country, but his present character, in spite of these rather frivolous antecedents, is a very vigorous and sturdy one. Mr. Nordhoff stands with him beside the graves of his five children—all of whom he had lost between the ages of eighteen and twenty-one. "After a minute's silence he turned upon me with sombre eyes and said: 'To bear all that comes upon us in silence, in quiet, without noise, or outcry, or excitement, or useless repining—that is to be a man, and that we can only do with God's help.'" Mr. Nordhoff gives further some account of several smaller and more struggling Communes—the Icarians, a French society in Iowa; a Swedish settlement, at Bishop Hill, in Illinois; a cluster of seven hopeful Russians (one of them a "hygienic doctor") at Cedar Vale, in Kansas; and, lastly, of an experiment in Virginia, embodying as "full members" two women, one man, and three boys. The three boys have a great responsibility on their shoulders; we hope they are duly sensible of it. There is also a sketch of some colonies—

notably that of Mr. E. V. Boissière, of Bordeaux, in Kansas—not strictly communistic. Mr. Nordhoff thinks, with regard to this last settlement, that its members sacrifice too many of the advantages of private life without securing in a sufficient degree those of association.

The volume is largely occupied with a very complete and exhaustive report on the various Shaker settlements. Everything is told here about Shakerism that one could possibly desire to know. There are in the country eighteen societies, with something less than twenty-five hundred members, and possessing some fifty thousand acres of land. The Shakers seem to us by far the most perfect and consistent communists, and Mr. Nordhoff's account of them is very interesting. He explains everything indeed in the matter but one—how twenty-five hundred people, that is, can be found to embrace a life of such organized and theorized aridity. But to comprehend this one must reflect not only on what people take but on what they leave, and remember that there are in America many domestic circles in which, as compared with the dreariness of private life, the dreariness of Shakerism seems like boisterous gaiety. "It was announced," Mr. Nordhoff quotes from a Shaker record, "that the holy prophet Elisha was deputized to visit the Zion of God on earth. The time at length arrived. The people were grave, and concerned about their spiritual standing. Two female instruments from Canterbury, N. H., were at length ushered into the sanctuary. Their eyes were closed, and their faces moved in semi-gyrations. . . . One or two instances occurred in which a superhuman agency was indubitably obvious. One of the abnormal males lay in a building at some distance from the infirmary where the female instruments were confined." These few lines strike the note of Shaker civilization; and it requires no great penetration to perceive that it cannot be a very rich civilization. It proceeds, indeed, almost entirely by negatives. "The beautiful, as you call it," said Elder Frederick to Mr. Nordhoff, "is absurd and abnormal. It has no business with us." And he proceeded to relate how he had once been in a rich man's house in New York, where he had seen heavy picture-frames hung against the walls as "receptacles of dust." The great source of prosperity with the Shakers has evidently been their rigid, scientific economy, carried into minute details, and never contravened by the multiplication of children or non-producing members. Mr. Nordhoff says that they do not toil severely (this is his testimony as to most of the communes); but they work steadily, unremittingly, and, above all, carefully, and they spend nothing on luxury or pleasure. The author emphasizes strongly the excellent quality of their work and their produce (this, too, is a general rule), and the high esteem in which they are held as neighbors and fellow-citizens. They "avoid all speculative and hazardous enterprises. They are content with small gains, and in an old-fashioned way study rather to moderate their outlays than to increase their profits. . . . Their surplus capital they invest in land, or in the best securities, such as United States bonds." There is a kind of wholesome conservatism in the Shaker philosophy, as Mr. Nordhoff depicts it, which we confess rather takes our fancy. It is grotesque and perverted in many ways, but at its best points it is both the source and the fruit of a considerable personal self-respect. Mr. Nordhoff gives a number of long extracts from the publications of the Shakers expository of their religious views, from which it appears that they are "spiritualists" in the current sense of the term. But their manifestations and miracles strike us as rather feeble and third-rate. They ought to come up to town occasionally, and take a few lessons at some of the more enterprising repositories of the faith. They have, however, a sacrament of confession to their elders of evil thoughts and deeds which seems to us respectable from their own point of view. It is rigidly enforced, apparently, as far as is possible, and it is a testimony to their sense of the value of discipline. The more accomplished "spiritualists," we are afraid, don't confess. We think of the Shakers as sitting in their more brilliant moods "with their faces moving in semi-gyrations"; but we regret nevertheless to learn that their number is decidedly not increasing. That they do not continue to make recruits is perhaps a sign that family life among Americans at large is becoming more entertaining.

The most interesting, or at least the most curious, section of Mr. Nordhoff's book is his report on the Oneida Perfectionists:

> "We have built us a dome
> On our beautiful plantation,
> And we have all one home,
> *And one family relation.*"

If the lines we quoted just now gave the key-note of culture among the Shakers, this charming stanza gives the key-note of culture among the ladies and gentlemen at Oneida. The line we have italicized seems to us to have a delightful naïveté, shadowing forth as it does the fact that these ladies and gentlemen are all indifferently and interchangeably each other's husbands and wives. But Mr. Nordhoff chronicles many other facts beside this; as that the ladies wear short hair, and jackets and trowsers; that the community numbers nearly three hundred persons; that it is worth half a million of dollars; that it has "faith-cures"; and that it assembles of an evening in the parlor and devotes itself to "criticism" of a selected member. It is on a very prosperous footing, and it has in Mr. J. H. Noyes a very skilful and (as we suppose it would say) "magnetic" leader. Propagation is carefully limited, and there are, as may be imagined, many applications for admission. "If I should add," says Mr. Nordhoff, "that the predominant impression made upon me was that it was a commonplace company, I might give offence." Very likely; and the term is not the one we should select. Such a phenomenon as the Oneida Community suggests many more reflections than we have space for. Its industrial results are doubtless excellent; but morally and socially it strikes us as simply hideous. To appreciate our intention in so qualifying it the reader should glance at the account given by Mr. Nordhoff of the "criticism" he heard offered upon the young man Henry. In what was apparent here, and still more in what was implied, there seem to us to be fathomless depths of barbarism. The whole scene, and all that it rested on, is an attempt to organize and glorify the detestable tendency toward the complete effacement of privacy in life and thought everywhere so rampant with us nowadays. For "perfectionists" this is sadly amiss. But it is the worst fact chronicled in Mr. Nordhoff's volume, which, for the rest, seems to establish fairly that, under certain conditions and with strictly rational hopes, communism in America may be a paying experiment.

## DEMOCRACY AND MONARCHY IN FRANCE.*

PROFESSOR ADAMS says in his preface that he proposes to show in his book that "the present political character of the French people is the legitimate result of certain doctrines and habits that have been taking root in the nation during the past hundred years," and that "there is no more potent political truth than this, that the present has its roots running far back into the past, and that it draws its life from ideas and institutions that have gone before, just as certainly as the vegetation of to-day receives its nourishment from the decaying remains of preceding organic life"; that, in short, "while on the one hand the present is the child of the past, on the other it is in its turn to be the parent of the future." The failures of the French during the past century to establish any permanent form of government he ascribes to the growth and predominance of what he calls "the revolutionary spirit," and the revolutionary spirit he defines as "the claim of the ignorant and passionate multitude to sit in authoritative judgment on every act of the Government." He accordingly examines, under the guidance of this idea, the philosophy of the great Revolution, its politics, the rise of Napoleonism, the Restoration, the Ministry of Guizot, the Revolution of 1848, the Second Republic and Second Empire; and endeavors to prove that whatever was evil in the constitution of the Government during these periods, or whatever led to its overthrow and the trial of something else, was due in a greater or less degree to the assertion on the part of the ignorant and unthinking multitude of their right to solve summarily the fundamental problems of the national life. Mr. Adams works out his theory with abundant citation of authorities and illustration, in a style which is always clear and often impressive, and with a certain air of dogmatic dignity which is perhaps due to the fact that the book originated in a series of college lectures. To call it an historical study, would perhaps be misleading, for it makes no pretence to be impartial or tentative. The author produces at the outset a series of charges against the French nation, and proceeds to prove them, without any attempt to disguise the process. The result is perhaps not wholly satisfactory from the historical point of view, because the author naturally only adduces such facts and quotations as make for his own view, and naturally and inevitably passes over much which might weaken or blur his conclusions. But this fault, if it be a fault, is one inseparable from all attempts to expound what is called the philosophy of history. In the case of professed historians, like Mitford or Froude, who, besides preaching a certain political or social gospel, undertake to present a complete historical narrative, it becomes so serious as sometimes to call for the severest reprehension. But Mr. Adams does not place himself under the restraints of an ordinary historian, nor yet those of a simple historical student. What he offers is an essay to deal with perhaps the most remarkable phenomenon of contemporary politics from the historical standpoint; and those who will complain that he has colored his facts too highly or has sometimes seemed to arrange them to suit his argument, must bear in mind

* 'Democracy and Monarchy in France, from the Inception of the Great Revolution to the Overthrow of the Second Empire. By Charles Kendall Adams, Professor of History in the University of Michigan.' New York: Henry Holt & Co. 1874.

that he is maintaining a thesis, and that if his book bears a strong resemblance to an historical narrative, it is due mainly to the fact that he draws his proofs from a whole century of extraordinary eventfulness.

In answer to the question, how has he succeeded? we should say that he has, even with the drawbacks above-mentioned—as doubtless some will call them, though we do not so consider them—produced a valuable example of the scientific mode of dealing with political problems, because his propositions with regard to the secrets of French disaster are really an induction from observed facts, whether from a sufficient or insufficient number of them, and are not—as so much of our philosophy of history is—a bundle of deductions from some *à priori* notion or prejudice evolved from the writer's social or religious training. It strikes a blow, which we heartily rejoice to see coming from a professor of history in a great university, at that common though widely-received newspaper explanation of political troubles in the Old World, and which the growth of both biological and sociological science has already made ridiculous to most educated men—that when a nation fails to attain the complete happiness which is supposed to result from popular government, it is due, not to anything wrong in the character of the citizens, but to the machinations of a small body of persons called "aristocrats" or "monarchists," who are supposed to exert the same malign influence on the fortunes of an ingenuous, well-meaning, but simple-minded person called "the people" that Satan used to exercise on the strivings after holiness of the mediæval monks. The extirpation of this remnant of Rousseauism, as Mr. Adams shows it to be, is absolutely necessary, not only to sound thinking about foreign politics, but about our own. That government is the true product of the society governed, is an axiom which lies at the basis of all sound political reasoning. Treating bad government as something outside the people who live under it, is like treating an ulcer as a fetish, which has settled on the human body with the malignant design of annoying it or exhausting it.

Mr. Adams, as it seems to us, has produced from recent French history a strong case in support of the theory that a nation is at any given period the product of its historical antecedents; whether he has produced an equally strong one in support of the theory that France has been during the last century the victim of "the revolutionary spirit" may, perhaps, be questioned. The revolutionary spirit, as Mr. Adams defines it—that is, the desire of the ignorant and unthinking multitude to sit in judgment on every act of the government—may be said to exist in all countries. Undoubtedly, it has been stimulated to an unusual degree in France by the philosophy of the Revolution, which presented the whole past of the country to this same multitude as a gigantic and hideous mistake, and preached the possibility of erecting a new social and political structure without any reference to this past. But then this revolutionary spirit, after the revolutionary cataclysm was past, and the political system of the country had been placed on a new basis, undoubtedly disappeared among the peasantry, who are to-day the most conservative population in Europe. It grew in the cities, and especially in the greatest of the cities—Paris; but it would there have been powerless as regarded the government, as it is in England or Prussia, but for the one feature of the old régime which the Revolution left standing—the centralization of the machinery of administration. It is this which both enables the Paris mob to exert the malign influence on the national fortunes which Mr. Adams has so well described, and tempts them to exert it. Given such centralization, such a mob, and such a destruction of political habits and of provincial centres of responsibility as the Revolution wrought, and the history of such a country may almost be predicted.

---

*Life and Labors of Mr. Brassey*, 1865–1870. By Sir Arthur Helps, K.C.B. With a preface to the American Edition by the author. (Boston: Roberts Bros. 1874.)—In these days, when the methods of railway construction excite so much attention, the record of the life and labors of one of the greatest railway-builders of the century has special interest. With our recent experience fresh in mind, from the war down to the Crédit-Mobilier and the California Contract and Finance Company, there are some of the elements of romance in the story of a contractor who always performed his contract, profitable or unprofitable, and who in building for other people thousands of miles of railroad retained an average profit of only three per cent. on the money passing through his hands. It is not often that there comes to a man the felicity both of being a pioneer of new discovery in civilization, and of seeing the works he tended in infancy grow to complete development and spread to universal use within his lifetime. Yet Thomas Brassey, like Professor Morse in the case of the telegraph, had this rare fortune. He was engaged with George Stephenson in building the Newton and Birmingham line in 1834, one of the earliest railways constructed in England. When he died in 1870, the world had in operation one hundred and eighteen thousand miles of railway, and land transportation had been revolutionized. Mr. Brassey's personal share in this work may be appreciated from the statement that at different times he was engaged in building six thousand six hundred miles of railway, in England, France, Spain, Italy, Germany, Austria, Denmark, India, Canada, and South America; that he disbursed in their construction nearly four hundred millions of dollars; and that he had at times in his employ, directly or indirectly, an army of eighty thousand laborers. His character as sketched by his biographer was most estimable. Honest, faithful, just, kind-hearted, modest, not greedy of gain, he seems to have been a type of contractor not often produced in any country.

This biography is an admirable bit of book-making. Mr. Brassey's private life was uneventful. His public career may be almost summed up by the enumeration of the railways he aided in building. The engineering and administrative triumphs won in constructing a railway excite as a rule very little public interest after the work is done. Yet Sir Arthur Helps—although, as he says, without special qualifications for the task, and relying almost exclusively upon material furnished by others—has so handled his subject as to give us a book which will interest those who never heard of Mr. Brassey and who care nothing for railroads or public works. The simple charm of his style makes even his most commonplace remarks pleasant reading. To be sure, one has a feeling sometimes that the gold is beaten about as thin as it will bear, as, for example, in the chapter on Mr. Brassey's wealth, when the solitary fact at its close reveals how very little there really was to say. But it is ungracious to criticise the poverty of fact when the compiler works up so faithfully all that he has. Perhaps the most instructive portion of the book is the careful comparison between the English, French, Italian, and German labor employed by Mr. Brassey; and some of the remarks on his experience in building the Grand Trunk line in Canada are also fresh and striking. What we miss altogether is those facts connected with Mr. Brassey's labors which at the present time in this country would have the most interest and the most value. In all the chapters devoted to railroads built in Europe and America, the financial arrangements for executing such great works are almost unmentioned. The life of Mr. Brassey ought to have special interest for business men, yet the part which business men would most like to know is passed over in silence. Here was a great contractor, of acknowledged integrity, actively interested in placing before governments and before the public schemes which required and sought co-operation, capital, and subscriptions far and near. On what basis financially were these various roads built? What was the public asked to do? How and in what form did the contractor get back his principal and receive his profits? We conclude from such knowledge as we have, and from hints dropped occasionally in the book, that the methods adopted by Mr. Brassey were not substantially different from some which in this country have excited much indignation and abuse, particularly in the West. We regret that the author was either unable or unwilling to treat of these points. We must add, too, that his closing chapter on Railways and Government Control contributes little or nothing to the discussion of a question which is confessedly among the weightiest of our time.

---

*History of England* from the year 1830–1874, by William Nassau Molesworth, M.A., Vicar of Spotland, Rochdale. New edition. Three volumes. (London: Chapman & Hall; New York: Scribner, Welford & Armstrong. 1874.)—The first edition of this history appeared in 1871; the author, who is a clergyman, being already favorably known for his 'History of the Reform Bill of 1832.' An extract from a speech of Mr. John Bright's is printed on the fly-leaf, commending the work, in strong and justifiable terms, to such young Englishmen as wish to know "the history of their country nearest their own times," or, in other words, the period they are least acquainted with. There is probably nobody, whether writer for the press, or teacher, or merely political student, who has not experienced the inconvenience of being unable to lay his hands on a good compendium of recent political history. The last half century is usually the period which ambitious historians shirk, and it is apt to be left to be done piecemeal, by catchpenny writers or compilers, who dress up episodes to meet the immediate and passing demands of the popular market. Mr. Molesworth has endeavored, and very successfully, to supply this want as regards England, in the three volumes before us, in which the facts are, to use Mr. Bright's language, "plainly and truly stated." There is little or no attempt at philosophizing; the author maintains from first to last the steady pace of a veracious chronicler, in a simple, clear, and unadorned

style, and without any attempt at the "dignity of history." He treats no event, from an accession to the throne, or the public funeral of a hero, down to a murder or robbery which excited much public attention at the time, as beneath his notice, and they are all to be found in his book. His expressions of opinion are careful and restrained, and his opinions of course are those of a moderate Liberal. We can hardly point to any history of recent appearance which the political student will find better worthy of perusal, because it tells one of the most instructive stories in the annals of the human race—the conversion of a feudal society into a modern democratic one by the process of peaceful discussion. We do not know where to look for anything like it. The process by which the middle class in England got possession of the government in 1832, the use they have made of their power in the reform of the administrative machinery, of the system of taxation, of the municipal and colonial governments, of the administration of justice; in the provision of popular education and of relief for the poor; in the amelioration of the condition of the military and naval service, and in the final admission of the working-classes to the franchise, stands and must always stand among the most interesting and hopeful phenomena in the history of human progress.

*The Land of the White Elephant.* A Personal Narrative of Travel and Adventure in Farther India; embracing the countries of Burma, Siam, Cambodia, and Cochin-China (1871–72). By Frank Vincent, Jr. (New York: Harper & Bros.)—Mr. Vincent's journeying in Southeastern Asia lasted just a year, and but a small portion of it was off the common routes. The chief opportunity which he had of making novel observations was in travelling overland (if that can be said of a nearly all-water passage) from Bangkok to Saigon, when he was enabled to visit the wonderful ruins of Angkor, and to have an audience with the King of Cambodia, as previously with the Kings of Ava and Siam. While it may be doubted if this part or even the sum of his experience was worth a book of the dimensions of the present, it is still true that not so much has been written about the curious civilization of Farther India, and its architectural remains, as to make it difficult for the latest visitor to bring back an interesting tale. This Mr. Vincent has done without betraying any peculiar qualifications as a tourist or as an author; in a literary sense, indeed, his work is susceptible of great improvement, as we may see when he publishes, as perhaps he intends, a narrative of his other travels in the East. The title which he has chosen well enough embraces the countries which he skirted, but the "white elephant" hardly figures in his pages to the extent which might have been expected; in this respect recalling, but certainly not equalling, Mr. Pike's 'Land of the Aphanapteryx.' The King of Ava's elephant is thus described:

"The Mandalay animal I found to be a male of medium size, with *white eyes*, and a forehead and ears *spotted* white, appearing as if they had been rubbed with pumice-stone or sand-paper; but the remainder of the body was as 'black as a coal.' He was a vicious brute, chained by the fore-legs in the centre of a large shed, and was surrounded with the 'adjuncts of royalty'—gold and white cloth umbrellas, an embroidered canopy above, and some bundles of spears in the corners of the room. The attendants told me that a young one . . . was suckled by twelve women hired for the express purpose; these elephant 'wet-nurses' receiving 30 reals per measure, and thinking it a great honor to serve in such capacity."

This is suckling extraordinary, but the custom of the country in this respect is apt to excite comment from strangers. Mr. Vincent says: "I have frequently seen babes at their mother's breast alternating the nourishment of 'Nature's Nile' with pulls and puffs at their cheroots." So inseparable is their cheroot from the Burmese, from babyhood to manhood, that the men often utilize the holes made in their ears for ornaments, where these are wanting, by putting their cheroots in them; and so with "any small article in frequent use." The famous fruit called the *dorian* has been many times judged and generally condemned by the Western taste. Mr. Vincent reports that the smell of it "when first opened is like stale fish, and when eaten the flavor is like raw onions, leaving a nauseating garlic taste in the mouth. However, notwithstanding its rank odor, many European residents in the East profess to like the *dorian;* but we thought its primary, intervening, and final taste most unsavory—nay, even extremely disgusting."

The illustrations of 'The Land of the White Elephant' are numerous and good, being all from photographs. Cities, temples, idols, elephants, and natives of high and low degree are the principal subjects of them. The author has further done his duty by his readers in giving them serviceable maps and plans.

---

*XVIIIme Siècle:* Institutions, Usages et Costumes: France, 1700–1789. Par Paul Lacroix (Bibliophile Jacob). (Paris: Firmin-Didot Frères; New York: F. W. Christern.)—Pertaining to a kind of publication in which only a single nation of the world excels, this book is one of the series to which the author's 'Moyen-Age' and 'Renaissance' belonged, and like them presents the cream of the antiquarian's collections skilfully reproduced in popular form, and at a price not unreasonable, the inherent expensiveness of the method being considered. Here are a score of illuminated pages not greatly inferior to the tinted pages of rare vellums, or rather, in the present case, to the camaïeu and aquatint prints of the period—prints which the perfection of modern methods rather improves than spoils in the quotation; besides the colored plates, a luxury of cuts or *bois* amounting to some hundreds. One really need not be at the pains to collect rare prints of this kind when he can obtain thus the most curious of a professed collector's prizes, set forth in the happiest order and most illustrative way. The text supplied by M. Lacroix is best characterized by the publishers when they affirm that it is executed with the same care and the same tact as his previous works, and that it may be placed without danger "entre toutes les mains"—a concession to the "young person's" cheeks that is far from unnecessary when the period of Louis XV. is under consideration. The historic epoch thus committed to the hands of sensibility and the eye of taste begins, though, safely enough, in a period of piety mitigated by ennui; the Grand Monarch is pining under the velvet glove of Maintenon, and the arts which he had fostered have dwindled down to a few representations of the histories of Esther and Athaliah enacted by the young ladies of St. Cyr. A succeeding reign of profligacy, however, soon enough revenges this monotony, and, while rich bankers are allowed to ruin themselves in conducting the expensive theatricals of the court, we are permitted to see the costly and incredible dresses in which the great rôles of Voltaire were played by petted comedians. In that poet's 'Orphan of China,' the costume of Idamé comprises enormous hoops, undulating over Turkish trowsers, and a powdered head nodding with prodigious feathers; Mme. Vestris crowns the bust of Voltaire in a "shape" intended for Irene, her petticoat so prodigiously distended as to make her appear broader than she is long, and festooned around with wall-of-Troy borders; a Lekain plays Merope in a velvet turban heaped with white plumes, his fine eyes glancing over a shoulder covered with ermine; the silhouette of Juno is that of a dinner-bell; a male Zephyr has a skirt puffed into the shape of a dome; and, besides him, other male characters, demons, Neptunes, Eastern kings and African soldiers, have petticoats or kilts, short indeed, but expressing the widest imaginable angle in spherical trigonometry. The equally strange figures who form the audience for these artists—the abbés of the card-tables, "who never had any abbeys," the literary ladies who give audiences from the balustrades of their beds, the marquis who takes a needle-case from his pocket and completes the embroidery of a flower in a lady's tambour-frame, and the pert soldiers of Watteau's paintings, whose "gallantry" was altogether of a carpet sort—revolve through these pictorial pages like a world of marionettes. The coronation of Louis XV., from a work by D'Ullin, of the Royal Academy of Painting, shows similar masquerade figures in a moment of the most intense solemnity of which they were capable. The boyish king, then celebrated for his comeliness, wearing the crown of Charlemagne, clothed in purple with golden lilies, and carrying the sceptre and hand of justice; the Archbishop of Reims leading the king to the throne by his right hand, the six laic and six ecclesiastical peers variously robed in gold tissue—they are all graceful and decorous; but the permeating levity of the age gives the whole group the air of a troop of sylphs conducting some attenuated rites round the circumference of a fan. What is a great deal more human and pleasant is the bourgeois life of the day, the smart shoppers and promenaders in the Galerie du Bois du Palais, as seen in Gravelot's color-study, the chambermaids and happy burgher portraits of Chardin, and the family pieties, sincere if a little self-conscious, of Greuze. M. Lacroix is honest, and frequently turns the medal, following up the white-satin *bergerades* of Boucher with an old print representing a real peasant, enveloped to his heels so as to be a mere walking cloak, and no more idyllic than a saddle of mutton. We render the thanks of utter satiety after turning, without counting them, the innumerable illustrations of this work, a little rebellious, we must confess, at its appalling completeness, which does not spare us a fashionable curl of a wig or a bow of an "anglomane" bonnet. Surely, France reverences old times in a way that Carlyle would identify with worship of old clothes.

# The Nation.

*NEW YORK, THURSDAY, JANUARY 21, 1875.*

## The Week.

THE President's Message in response to the resolution calling on him for information about the Louisiana matter, maintains that the United States Circuit Court had jurisdiction in the case of Kellogg *v.* Warmoth in 1872, and also in the case of Antoine, but admits that some of the orders made in both cases were illegal; that nevertheless the process of the Courts having been resisted (there is no proof of this) he felt it to be his duty to employ the troops to enforce it; that whether Kellogg was or was not fairly elected subsequently is doubtful, but that it seems clear that McEnery was not lawfully elected either; that during the troubles arising out of these disputes there was a fight at Colfax, at which there was a barbarous butchery of over thirty-seven negroes; that there were six young men, some of them Republicans and office-holders under Kellogg, also murdered at Coushatta; that "many murders of a like character" were committed in other parts of the State; that the White Leaguers, in answer to a proclamation from Penn, the *soi-disant* Lieutenant-Governor, rose and overpowered the Kellogg government in September, 1874; that troops were sent down in consequence to put down this insurrection; that there was "intimidation" of Republican voters at the ensuing election—in proof of which he cites a paper signed by certain merchants of Shreveport agreeing to employ nobody who voted the Radical ticket, a piece of "intimidation" which Senators Morton and Conkling must laugh over heartily, in their sleeves; that he does not know whether the Returning Board acted honestly or not—he suggests that the long delay in canvassing the votes was due to the arguments of lawyers; but that he knows that it had the legal power to do what it pleased; that he had no knowledge and no idea that the troops were going to interfere with the organization of the legislature, and does not think such interference justifiable, but holds that there were circumstances connected "with the legislative imbroglio in Louisiana which seem to exempt the military from any intentional wrong in the matter"; that if a mob or body of unauthorized persons seize and hold the legislative hall in a tumultuous and riotous manner, so as to prevent any organization by those legally returned as elected, it may become the duty of the State executive to interpose, if requested by a majority of the members-elect; that if the Governor in Louisiana had attempted to use the police for this purpose there would have been a bloody conflict with the "White League," so he had to use the troops. He then gives an account of what occurred in the hall—substantially the same as General Sheridan's; says that whether the Governor had the right to interfere under the circumstances is "perhaps a debatable question"; eulogizes General Sheridan; disclaims all desire to have troops interfere in the domestic concerns of any State; and maintains that troops sent down to preserve order in a disturbed district must act in emergencies on the judgment of the commanding officer, who, as soldiers are not lawyers, are liable to make mistakes. He concludes by calling on Congress once more to settle what his duty is in the Louisiana matter, and promises to carry out their enactment in spirit and letter.

---

He appends to the message various justificatory documents (mainly loud "calls" for troops from Kellogg and Packard and others, on the ground that there was going to be "intimidation" during the registration), and the confidential instructions of the War Department to General Sheridan, the gist of which is that he is to make a trip in the States of Mississippi and Louisiana, see what the true condition of affairs is there, and send such suggestions to the President as may seem "reasonable and judicious." There is also a report from General Sheridan on "murders" and "outrages," declaring that 3,500 persons—the majority colored—have been killed and wounded on account of their political opinions within the State since 1866. He acknowledges, however, that he has no proof of this, as since 1868 no official or judicial investigation has been made. He has, nevertheless, he says, "ample evidence" that there have been 1,200 murders on account of politics since 1868, but does not say what it is he considers "ample evidence"; nor does he say what is "the mass of evidence" which "lies before him" of 183 "isolated murders" in various parishes which he names. He must pardon us for saying that what passes as evidence with angry cavalry officers does not always pass with either lawyers or logicians, and that since Mr. Hayes's Alabama murders, we are somewhat incredulous about these appalling murders of negroes just before election.

---

It is not fair for the President to say that soldiers are not lawyers. General Sheridan, as we pointed out last week, is, on his own showing, one of the greatest lawyers in the country. He is not only, too, a great master of parliamentary and constitutional law, as appears from his reports, but he feels equal to the peculiarly delicate task of legislating for a region in which "the air is impregnated with assassination" and one-half the population ready to cut the throats of the other half. He is, however, by no means the only person whose legal attainments have been first revealed by this Louisiana affair. At the meeting in Boston recently held to protest against the military interference with the organization of the legislature in Louisiana, Mr. Wendell Phillips made a speech, in which he hurled defiance at all lawyers present and to come, and staked his great legal reputation on the soundness of the proposition, that if there be any unfairness in the election of the speaker of a legislative body, or if any persons, even five per cent. of those present and participating, have not been returned as elected by the canvassers, the assemblage becomes *ipso facto* illegal, or liable to dispersal as a mob by the executive. It does not seem to have occurred to this great thinker that if this were good law it would have become a settled usage of parliamentary bodies to assemble and organize either in secret recesses of the woods and mountains or in fortified buildings and behind locked doors, because in the warfare which lasted for so many years between parliament and the executive the latter would be sure to have found cause between the calling of the roll and the election of the speaker for the dispersal of the members. Either he would have put his creatures up to making a disturbance, or he would have got outsiders to smuggle themselves into the hall to take part in the proceedings, and so furnish him with a good reason for coming down with the troops. The fact is, however, that the doctrine is only about a month old. Parliaments had been in existence a thousand years before it was heard of. It has owed its origin to the effect of the Louisiana imbroglio on the sensorium of Mr. Phillips and some other wiser people who think that a government of men is better than a government of laws.

---

The Sub-Committee, composed of Messrs. Clarkson Potter of New York, Phelps of New Jersey, Foster of Ohio (one Democrat and two Republicans), which went down to New Orleans to investigate the state of things in Louisiana, and was luckily present when the late military interference occurred, have returned, and made a report, which has probably attracted more attention than any document of a similar character which has been laid before the country for a long time, first because it is unanimous, instead of, as is usual, giving a Republican and a Democratic version; and, secondly, because the story it tells is totally opposed to the one which the Administration and its friends have been for some time telling the public—opposed, let us add, to the version which is necessary to keep the Republican party on its legs. The

three members of the Sub-Committee, too, are men of high standing and character—two of them lawyers, and all of them men of acuteness and judgment. They only stayed in New Orleans eight days, but they took 1,500 printed pages of testimony, and tried to get at the facts in the matter of intimidation by asking the Radicals to select parishes as good examples of what was worst in Conservative doings, and confining the enquiry to them. In Rapides Parish, for instance, three Conservatives were returned to the legislature by an election which the United States Supervisor certified as fair and peaceable. But before the Returning Board reached its decision, it declared all the Republicans elected, on the strength of the affidavit of its president, a Mr. Wells, that there had been intimidation in the parish. This was not brought to the notice of the Democratic counsel before the Board, and they had no opportunity to contradict it. The Sub-Committee in vain invited Wells to appear before them. He declined to do so, or to appear personally before anybody, but offered to send them written depositions, and, to crown all, it turned out he was not himself in the parish on the day of the election.

In short, neither in Rapides Parish, nor in the other parishes which they examined, did the Sub-Committee discover any proof of the intimidation on which the Returning Board altered the vote; nor did they light on any traces of the alleged outrages, although they offered every inducement in their power for persons of all classes to come forward and prove them. They cite one remarkable illustration of the way in which stories of intimidation are got up. Mr. Riddle, the United States Commissioner, issued a large number of warrants against white persons, on the application of colored persons, shortly before the election, and required the persons arrested to find bail, secured by real estate within the parish. As this would have caused great delay or difficulty, the friends of the persons arrested went to him in a long procession, each member offering his bond; this the Commissioner treated not only as derisive of his proceedings, but as "intimidation." The Sub-Committee close by a general review of the state of things in Louisiana, as it appeared to them, which we wish we could extract bodily. It may best be summed up by saying that under the existing government the judges have been corrupted; a board of the Governor's appointees has absolute control over the elections; the mode of trying titles to office is extraordinary; the city police is an armed military force, maintained by the city, but commanded by the Governor; the constitution has been evaded by substitution of appointed for elective judges, by extraordinary burdens of taxation, and measures of unusual and unprecedented severity against persons in arrears. In short, there is a general want of confidence in the government; complete prostration of business, and depreciation of private property and of the public securities, which have fallen in two years from 70 and 80 to 25; an increase of taxation "almost literally to the extent of confiscation"; and, as a natural consequence of these things, a general resort on the part of the negroes of the rural districts to petty marauding as a means of livelihood.

Mr. E. W. Stoughton has written a letter to the *Times* on the occurrences in Louisiana which has given much comfort to the friends of the Administration, but very much more than a close examination of the letter will account for. Apart from expressions of confidence in the goodness of the President and General Sheridan's and General De Trobriand's intentions, and in the sagacity of the members of the Cabinet, and of a sense of the desirableness of waiting for full particulars before making up our minds, what Mr. Stoughton has to say is that the body which General De Trobriand interfered with was not a "lawful legislature, peaceably assembled," but "a lawless body, which had come into existence by violence and fraud." His version of the facts on which these conclusions are based is that one hundred and two persons lawfully elected members of the legislature entered the hall at the appointed hour, and their names were called over, according to law, by the clerk of the old House, and that immediately thereafter, by a hocus-pocus vote, in which five persons present whose names were not on the roll took part, Wiltz, the Conservative candidate, was elected Speaker, and sprang forward and took the chair, by force or surprise; and that thereupon, in the presence of the Radical members, the five persons above-named were declared duly returned as members of the Assembly. This is the whole of Mr. Stoughton's story. Now, if these occurrences—that is, the unfair or fraudulent election of the Speaker—converted the persons present into "a lawless body, forcibly assembled," and gave the Governor the right to interfere, it was his duty to have cleared the hall and made it ready for the lawful occupants. But, according to Mr. Stoughton, he did nothing of the kind. He simply sent soldiers in to remove the five persons who, as he thought, had not been properly returned. The rest of the "conspirators," as Mr. Stoughton calls them, he left in the hall, to continue their wicked work, whatever it was, and prevent the meeting of the lawful legislature, and there they remained, or might have remained, to this day.

We think, however, it is plain as a pikestaff, on Mr. Stoughton's own showing, that the body of persons who assembled in the hall of the House of Representatives were not, as he would have us believe, a lawless mob, but the materials of the lawful legislature. That they assembled peaceably and regularly is shown by the fact, which Mr. Stoughton acknowledges, that the clerk of the old House called the roll in proper form. That the body as it stood at this point did not possess the rights and privileges of a parliamentary body, because it had not yet elected its speaker, and might lawfully be set upon by troops and dispersed, is a doctrine for which, we say it with all deference, Mr. Stoughton is unable to produce a shadow of authority either in dictum, decision, or precedent. What happened afterwards was that this lawful parliamentary body, peaceably assembled, did not elect a speaker in a manner which an outsider named Kellogg thought proper. Certain persons were allowed to vote whom an outsider named Kellogg thought not qualified, and he therefore interfered, not to disperse a mob, as in Mr. Stoughton's theory he ought to have done, but to arrest five persons sitting in the House in the presence of a lawful quorum of the House. In short, if Mr. Stoughton's law were good, any governor might go down with troops when a legislature was about to elect a speaker, and break the body up, on the ground that there were outsiders in the House or that the proceedings were not fair; whereas the immemorial usage of parliament is that, a quorum of legally returned members being present, they are sole judges and arbiters of the rightfulness and wrongfulness of everything that occurs subsequently, and, even if a quorum be not present, they have the right to adjourn from day to day, and arrest and compel the attendance of the absentees, and nobody has the shadow of authority to interfere with them.

Congress is getting on very slowly with its work, and it looks as if very little would be done by the 4th of March beyond the passage of the Appropriation Bills. The debate on the Louisiana interference has recently occupied much of the time, and the reimposition of taxation promises to occupy much more. Last week, Mr. Kasson introduced a supplementary specie-payment bill in the House, to provide for the destruction of retired legal-tenders; and the House passed a bill, reported from the Banking and Currency Committee, removing the limitation on the circulation of gold banks. On Wednesday the President's message on Louisiana was received in the Senate, and a long debate took place in the House on the report of the Secretary of the Treasury as to the changes made in the tariff by the revised statutes. Many complaints have been made in some of the newspapers that the committee which had in charge the codification of the statutes had made material alterations in the laws; but the fact seems to be more probably that there arose in the revision of the statutes great difficulty of determining exactly what the tariff laws actually were in particular cases, owing to the multiplicity

of opinions, often conflicting, delivered by Government officials. This matter was referred, after some debate, to the Committee on the Revision of the Laws. On the same day an attack was made by the Democrats on the Indian Department, and particularly on the appointment of Orville Grant, the President's brother, as trader at one of the Indian agencies, which Mr. Beck declared to be in contravention of the Intercourse Law of June 30, 1834. On the same day, Mr. George H. Boker of Philadelphia was confirmed by the Senate as Minister to Russia. On Friday, the bill for the sale of the Japanese indemnity bonds and the distribution of the proceeds was rejected, and the report of the Louisiana Investigating Committee was presented. The Senate on Monday rejected a proposition to reduce the salary of the Commissioner of Internal Revenue, and discussed the proposed Bureau of Commerce and Statistics. The House passed a bill to pay $25,000 for Kalakaua's visit, and the Committee on the District of Columbia made a report, showing gross mismanagement under Shepherd.

The President has approved the Finance Bill recently passed, and accompanied his approval with a message which, in one respect at least, is very remarkable, and illustrates the extraordinary way in which the majority in Congress attends to some of the most important business of the country. The Currency Bill, we need hardly say, was intended to be one of the most important pieces of legislation since the war, being neither more nor less than an attempt to rescue the currency of a great commercial nation from the disorder of fourteen years of war and turmoil. If ever there was a bill, therefore, which called for careful debate, it was this. In any other civilized legislature, it is safe to say, it would have been discussed for a couple of weeks in each House, and light thrown on it from every quarter, and it would probably have been prepared after a careful enquiry by a committee. As a matter of fact, however, it was not debated at all, and was concocted in a caucus. In the Senate, it passed almost on a brief statement from Mr. Sherman. In the House, it was not even referred to a committee at all, and was put through without comment under the previous question.

The result is that the President, who, in company with the *Evening Post*, looks on it as a *bonâ-fide* financial scheme, or else pretends that he does, has now produced in a message, in the simplest way, the various considerations which members of the legislature should have produced in debate. He points out that if we are going to resume specie payments in 1879, as the bill provides, we must make some provision by increased taxation both for the requisite annual contribution—about $30,000,000—to the sinking fund, and for the redemption of the $80,000,000 of greenbacks of which the bill contemplates the withdrawal whenever $100,000,000 are issued in national-bank notes; and for this purpose he suggests the restoration of the duty on tea and coffee, and the repeal of the ten per cent. reduction made on certain articles on the tariff in June, 1872. He is apparently much more enlightened about the laws of a silver currency than he was in 1873, and mentions, as somebody ought to have mentioned in the House, that the provision of the bill for the substitution of silver coins for the fractional currency cannot be carried out while the premium on gold is over ten per cent., inasmuch as the silver would at this rate be exported as fast as coined. He perceives now clearly that you cannot keep coin afloat in company with a legal-tender of lower value, even with the aid of "the previous question." By way of preparing for resumption in gold, he suggests that the Secretary should be in the meantime empowered to redeem legal-tender notes, in sums not less than $100, at the rate of 110, less interest at the rate of two and a half per cent. per annum from the 1st of January, 1875, and diminishing the premium from time to time until 1879. He fixes the rate at which the greenbacks should be redeemed at ten per cent. because, at this rate, silver would stay afloat; and he calls for a new mint, in order to produce the amount of silver coin which the execution of the law will require. But Congress, to be consistent, ought to lay the message on the table without allowing it to be read.

The Pacific Mail enquiry is still going on, and at one time during the week promised to lead to valuable results, in the discovery of some half-a-dozen members who, at the time of the passage of the subsidy, were seen going about with suspicious thousand-dollar bills in their possession. These bills, according to the testimony of one Dillon, clerk of the Sergeant-at-arms, were either "broken up" or deposited with this officer, but an examination of the latter's books seems to show no traces of them, and the conclusion is that they were simply broken up. Irwin has got himself taken before a judge on *habeas corpus*, and still declines to make any disclosures, though it seems he holds private audiences, now and then, in which he makes dark insinuations as to knowledge of the subsidy corruption possessed by various persons. On Monday, Mr. Whitelaw Reid, the editor of the *Tribune*, appeared before the Committee, and was asked to explain some remarks of the *Tribune* on the scandal. He mentioned one or two persons whom he thought, without knowing anything of his own knowledge, might aid the Committee in their enquiries; but the chief interest of his examination turned on a paragraph or article referring to two members of Congress as being currently reported to be implicated. The Committee very foolishly asked Mr. Reid who these Congressmen were, when they had the pleasure of learning that they were Messrs. Dawes and Wood. Mr. Reid, however, stated that he only mentioned the rumor as one which was current, and it apparently came from "well-informed" circles in Wall Street.

On Monday, the 18th, Major George E. Head entered the Vicksburg sheriff's office with a squad of troops, and drove out the sheriff, Mr. J. A. Flanagan. Flanagan is Crosby's successor, he having been elected sheriff on the Conservative ticket towards the end of last month after Crosby's ejection, and was in full legal possession of the office, there not having been even a case at law on the subject. Major Head, having driven Flanagan out, retired for a brief consultation, not with the General commanding the Department, or even the Governor of the State, but with "Chancellor Hill," who we should suppose from his title had merely an equitable jurisdiction, but who by some process best known to himself immediately appointed one William H. McGhee sheriff *pro tem.*, McGhee having been deputy under Crosby. These proceedings are so monstrous and unprecedented, even in the South, that we must confess our inability to characterize them properly. They are, on the facts now stated, worse than anything done in Louisiana, for not even a pretence of law is made, but the military, in collusion with a judge, arrange the government as they please on the Mexican plan. It will, no doubt, be defended on the ground that two months ago some negroes were unjustly and cruelly killed by the Vicksburg whites, but we believe that the public understand this kind of argument now pretty well.

The only news from Europe of much moment is that Mr. Gladstone has formally resigned the leadership of the Liberal party in the House of Commons. This was foreshadowed in the letter of our correspondent weeks ago, and in the same place will be found some useful speculation as to his probable successor. The publication of the pamphlet on the Papacy was one more added to the causes which had before his late defeat done much to unfit him for the place. There is now a fair prospect that the Conservatives will stay in power, in the absence of any sudden cataclysm, for five or ten years, and they will be kept there by the thoroughly lethargic temper of the public. This period would undoubtedly bring Mr. Gladstone to the close of his working career, and he is by no means very able in opposition. He has a singularly fertile and acute mind, and shines most of all in suggestion and origination. His somewhat morbid conscientiousness, on the other hand, makes him a poor critic or assailant, and he therefore probably does wisely in seeking well-won repose. The appearance of another article from his pen in the *Edinburgh Review* on the Papal question makes it seem as if he were going to make this a specialty. The successor most talked of at this moment is Mr. Forster, who has undoubtedly the requisite wei ght for the place, but would as a debater fill it only indifferently.

## TRICKS OF INTERPRETATION.

THE *Evening Post* had the other day some excellent observations on what Mr. Sumner called "the sleeping giant of the Constitution," or, in plain English, that clause of the Constitution which directs the United States Government to "guarantee a republican form of government" to the various States. The *Post* pointed out that the modern interpretation of this clause is "wholly a modern discovery"; that "the adjective 'sleeping' was applied to the clause because no one had ever previously thought of using it for its present purpose, and the substantive 'giant' was applied to it because it was thought to yield an ample constitutional power, authorizing the nation to do what at that time it felt disposed to do." They who flattered themselves that, after the war was over and the work of Reconstruction completed, "the giant" would be allowed to sleep, are evidently mistaken; for the proposal to interfere again in Louisiana by ordering a new election, which is now before Congress, and the proposal to interfere in Arkansas by overturning the present State constitution, which a powerful carpet-bag lobby is now urging on Congress, are both plans for waking "the giant" up and setting him to work, and, more than this, for keeping him awake and active as long as the Government lasts. The pretext, and the sole one, on which Congress talks of interfering in Louisiana is that, inasmuch as the last election was unfair, the State does not possess a "republican form of government"; the pretext, and the sole one, on which Congress is asked to interfere in Arkansas, is that the constitution, though confessedly adopted by a large majority of the people, was not submitted to them in the manner prescribed by the previous constitution, or, in other words, was adopted in an irregular manner. It is an easy inference, and an inevitable one, that if the construction of the Constitution on which these schemes are based should prevail, the States would be reduced to the level of municipalities, and the State constitutions to that of city charters. If Congress has power to "order a new election" in Louisiana, it has exactly the same power in Massachusetts; if it has the power to set aside the Arkansas constitution, it has the power to set aside the late amendments to the constitution of this State. In fact, as is now, we are glad to say, becoming obvious to people at the North ever since the readmission of the Southern States to the Union, whatever affects the relations of the General Government to those States affects its relations to all the States; and whatever the majority in Congress may be allowed to do when composed of virtuous and well-meaning men, it must be allowed to do when composed of wicked and designing men.

We are not disposed to find fault with the various expedients resorted to by the anti-slavery men at the North both to carry on the war and to procure through the war the destruction of slavery, just as we have never been disposed to find fault with Mr. Chase for issuing the legal-tenders. There are some crises in which a struggle for the strict construction of constitutions and statutes is very like the race, with the mob at his heels, of the Master of the Ceremonies at Versailles after Lafayette towards the royal apartments, shouting to him, in order to save the court etiquette from a total overthrow, that the King permitted him the "grandes entrées." When men are dying for a certain object by the ten thousand, to tell them their views are unconstitutional has an air of ghastly absurdity about it. Things that are done in war are hardly more likely to be drawn into precedent in time of peace than an officer who makes requisitions on the march is likely to rob on the highway after he returns home. The danger to free government from war begins after the hostilities are over, and lies in the desire and attempt of those who have been carrying on the war to keep up its doctrines and methods in quiet times and convert them into political usages. Therefore, although it made very little difference on what constitutional theory the slaves were freed or Southern cities occupied and governed between 1861 and 1866, it makes a great deal of difference on what constitutional theory the President sends troops down to New Orleans in 1875. Mr. Sumner's sleeping giant was a very harmless monster while the cannon were roaring, and he could be put to some work suited to his capacity in the field, and when he could comfort Mr. Sumner without injuring anybody else. But now that we are settling down on the principles and practices on which the nation means to live during a thousand years of peace, it is proper to say that the giant is not, as one might suppose, a creature of enormous power, but a common trickster or "confidence man," who ought not to be allowed to open his lips in any assembly of honest people.

It is plain to be seen by the proposals made with regard to Louisiana, that the purpose of the majority in Congress is to give the phrase "republican form of government" not only a wider meaning than that in which the framers of the Constitution used it, or than the civilized world now attaches to it, but a meaning which will cover almost unlimited Federal interference in State affairs. What the majority in Congress now mean by a "republican form of government" is a government satisfactory to them, or a government set up in a way satisfactory to them, no matter how carefully the marks of a republic may be preserved in the Constitution. For instance, if there has been fraud or intimidation at the election of the governor or legislature, they are disposed not only to treat fraud or intimidation as depriving the Government of its republican character, but to decide themselves how much fraud or intimidation is necessary for the purpose. But they will not specify how many votes must be falsely cast, or how many voters "intimidated," in order to warrant Congress in "ordering a new election" and the President in sending down troops; and, as far as appears now, any number of fraudulent votes, or any amount of intimidation which deprives the party in power of a working majority, would suffice. "Intimidation," too, is a word of course of the vaguest kind, of which there exists no legal definition. Anything which frightens a man, or which he says frightens him, will come under that head in the estimation of the present and last Congress. As one can only know from the man himself whether he was frightened or not, all that is necessary under the ruling theory to warrant Congress in setting aside an election is that one or more persons shall say that they were prevented from voting through fear. For instance, the Government, as Mr. Schurz pointed out in the happiest way in his late speech, is the greatest intimidator of voters in existence—the "champion intimidator," as he termed it. At every election it "intimidates" all persons in its service—about 60,000 in all—by threatening them with the loss of their places in case they vote against the party to which the President belongs; and it carries out this threat. Nevertheless, under the Enforcement Acts a private citizen who does this with his employés is liable to criminal prosecution, and large numbers of persons in Louisiana and Alabama were at the late elections arrested for this offence and dragged from their homes to find bail at great distances; and Congress claims the right on such charges not only to have persons guilty of them punished, but to overturn the State government. We need hardly say that no election ever occurs either at the North or South in which there is not some intimidation and some fraud; and if we allow the majority in Congress to decide that any fraud or intimidation destroys the republican character of the State government, and rouses "the sleeping giant," of course the State government becomes an expensive and useless mockery, and the best thing to be done is to attach a bureau of State Administration to the custom-houses or post-offices, and turn the collectors or postmasters into prefects.

The truth is, and it is a very melancholy truth, that in the efforts to cover not only what has been done at the South, but what in the estimation of every good Republican had to be done in order to make the colored people a true part of the body politic, a large portion of the party (and in some respects the best portion of it) has worked itself into what may be called a thoroughly dishonest frame of mind, in which it is ready for any trick, whether of interpretation or policy, which may seem necessary to the great end in view. The plan of interpreting and construing the Constitution so as to get out of it, not what the framers meant, or what any generation since the framers understood it to mean, but what it would now be convenient to one party or the other to have it mean, was originated in the heat

of the anti-slavery struggle. To say that it is thoroughly dishonest is only passing on it a portion of the condemnation which it deserves. It must also be said that the work of forced construction for any purpose, however high or holy, is one of the basest and most debasing in which the human mind can engage. It has produced in past times some of the very worst and most mischievous examples of moral as well as intellectual degradation. The man who introduces it as one of the weapons of political warfare into a country like this is the agent of a worse corruption than any of the "Bosses" have been guilty of. That Mr. Sumner should have rejoiced in being the discoverer of one of its devices, and should have prided himself on the use of it, is simply a dismal reminiscence, of which his friends ought to be ashamed. His "giant" was a wretched impostor. He (Mr. Sumner) knew that the Constitution, when made, did not mean that a republican form of government must necessarily be based on universal suffrage. He knew that the present generation did not so understand it. He knew that no one ever dreamed of supposing that a government ceases to be republican if an election is marked by frauds or disorders. He knew, too, that for the party in power to attach new meanings to certain terms in the Constitution was simply to amend the Constitution, not in the regular and honest way, but by a trick, by which the minority, for whose protection the Constitution was made, was defrauded of its just rights. The consolation honest men have in witnessing these dodges on the part of men pluming themselves on their morality, is that they cannot succeed except for a brief period. Unscrupulousness on one side produces counter-unscrupulousness on the other, and excess begets reaction. The reckless course which the Republican party is now pursuing will undoubtedly before long bring the Democrats into power, and when in power they will undoubtedly arm themselves with weapons from the Republican arsenal. The "giant" will be waked up, and forced to do dirty work for the Democrats as he did it for the Republicans. For the outrageous legislation of the Republican party for the protection of the colored voters will be substituted, not moderate, reasonable, and legal protection, but the absence of all protection. For the reckless use of the troops at the South will be substituted the total withdrawal of the troops; and we feel sure that the shameless effrontery recently displayed in the manufacture of "outrages" will be succeeded by indifference regarding all negro disabilities or sufferings. If anybody doubts these predictions, let him read the justifications of Sheridan's interference with the Louisiana Legislature which one now finds in many Republican papers, on the ground that Pierce and the Democrats committed and applauded the same violence when committed against the Legislature of Kansas, and that General De Trobriand was first called in at New Orleans by the Democratic side.

## THE PROPOSED LEGISLATION FOR LOUISIANA.

ALTHOUGH the government headed by Kellogg is conceded by all except a comparatively few bitter and blind partisans to be an impudent usurpation, sustained in place by the United States soldiery alone; although an election has just been held in which the wishes of the people were unmistakably made known; and although the special report of a committee, composed of three as honest, fair-minded, and judicious men as could have been selected from the whole House of Representatives, shows that this election was conducted without the slightest wrong on the part of the actual majority, and that the interference and "intimidation," if any, were from the other side, yet in the face of these facts—facts which are undeniable, and which cannot be covered up by the most vigorous expedients of diligent partisanship—the President advises Congress to order a new election; and the current of opinion among those more moderate Republicans who are unwilling to deliver over the State completely into the hands of Kellogg, Casey, and their associates, seems to be tending towards the adoption of his plan. A bill has already been introduced into the House by Mr. Butler, and will, it is said, be reported by the Judiciary Committee, which authorizes such an election and provides for carrying this purpose into effect. Although the proposed bill may receive some modifications in its course through the Committee and the two Houses, yet if passed it will necessarily include all the substantial features which are found in it at present. In all the provisions involving matters of principle —the powers of the national legislature, the relations of the Federal and the State governments, and the constitutional rights of the States themselves — any statute which should be enacted by Congress purporting to carry into effect the objects of this bill, could not differ from it in essential particulars. The criticisms upon Mr. Butler's method will therefore apply to any other plan for accomplishing the same design, because they will be directed not to the mere forms, the incidents, but to the very object itself which is sought to be attained. The important provisions of this proposed act—and of any other one which may be substituted in its place—are the following: the President appoints two chief commissioners, one from each party, who are to have exclusive control of the election; these chiefs in turn appoint subordinate officials, in pairs, for every election district throughout the State; within a specified time these local officers are to cause a new registration to be made of all the legal voters according to the requirements of the State laws, ample authority being conferred upon them for that purpose; on a certain day named an election is to be held under the control of the chief commissioners and their subordinates for all the State officers who are elective, including members of the legislature, minute provisions being made for the conduct of the election, the canvass of the votes, and the announcement of the result; all the ordinary violations of election laws are guarded against by heavy penalties, and in addition to these the vague offence of "intimidation" is expressly named; persons who shall claim any of the offices by virtue or under color of other elections or modes of choice are to be severely punished; exclusive jurisdiction is given to the United States Circuit Court over all criminal prosecutions arising out of a violation of the penal clauses of the statute; finally, the United States military forces may be used to aid in all such criminal proceedings, both in the service of process and in the enforcement of the judgments, and may also be used to repress violence or intimidation, and to preserve order during the election and during the preliminary process of registration. The persons who are found to have been chosen at this election for the various offices shall become the lawful holders of such offices, anything in the State constitution and laws to the contrary notwithstanding. The title of this bill is noteworthy: "An Act to provide for a general election in the State of Louisiana and to secure a republican form of government in such State."

Granting that there exists a very serious crisis in the political affairs of Louisiana, from which it is difficult to escape and to preserve the peace by any ordinary modes of administration—granting even that the immediate, direct, and practical result of the statute would be a fair, orderly, and quiet election, in which the will of the people would find a true expression, and that the persons chosen through its means would be the representatives of a majority of the electors and would thenceforward conduct the local administration in a proper manner, respecting and protecting the private and public rights of all classes of citizens—granting, in short, that all the immediate benefits to the State which its warmest friends could anticipate or hope would be fully obtained, there are still grave objections to such a mode of procedure in a constitutional government which must far outweigh all the advantages, however certain and sudden. The evils to be apprehended from wrong political precedents in a country like our own, in which the whole law, private and public, is developed from and built upon precedents, are so enormous that their disastrous consequences should be ever kept present in the sight of the legislators who make, and of the people who approve, them. Notwithstanding the extraordinary power possessed by the United States Supreme Court in the last resort to pass upon the validity of a statute of Congress and to pronounce it unconstitutional and void, this power is limited in its action and

comparatively weak in its efficiency, because it can only be invoked to determine private rights by the decision of private controversies; it cannot invade the domain of purely political administration or legislation. The limitations imposed upon Congress by the Constitution in respect of all matters political in their nature, which create political relations rather than private rights and duties, cannot be enforced by the judgments of courts. Their only sanction is a moral one—the restraining force of popular opinion. The interpretation of the grants of power made to the legislature must be primarily established by itself and finally by the people which it represents.

The language of the Constitution which confers a power upon the Federal Government to interfere under certain circumstances in the local affairs of a State, is so simple and plain that there is no room for construction. Louisiana is in all respects a State; its relations with the Union are normal; it stands in exactly the same position as that occupied by New York or any other of the commonwealths. As the legal status is thus defined, neither the President nor Congress can deal with it in an exceptional manner. The only portion of the Constitution which furnishes any appearance of authority for the measure under discussion is Section IV. of the IVth Article: "The United States shall guarantee to every State in this Union a republican form of government, and shall protect each of them against invasion, and, on application of the Legislature, or of the Executive when the Legislature cannot be convened, against domestic violence." The case of an invasion may, of course, be laid out of view. Whatever may have been the facts during the two years preceding the last fall, there can be no shadow of pretence, in the face of the report just made to Congress by Messrs. Foster, Phelps, and Potter, that any domestic violence existed during the recent election or the registration preliminary thereto, or at the time when the legislature convened, which would have justified a demand upon the President for aid, or a compliance on his part if the demand were made. But even if such domestic violence had existed, the remedy contemplated by the Constitution is simply the repression of the unlawful resistance by the military arm of the nation. No authority can be found in the particular provision for Congress to interfere by its statute and to order and conduct a new election. All that the clause calls for in any event is Executive action, directed to the single end of subduing the internal violence. The author of the bill shows by the title which he gave it that he does not claim any authority for the measure in the grant of power to protect a State against domestic violence; he rests it alone upon the other clause respecting a republican form of government. A vast meaning and import were given to these simple words by Mr. Sumner and a few others, who even found in them a sufficient authority for Congress to regulate the right of suffrage in the States, but their wild vagaries are hardly worthy of sober argument.

The precise language of the provision is noteworthy: The United States shall guarantee to every State a republican *form* of government. There would seem to be, therefore, but one case in which the power here conferred can be made efficient; but this interpretation may be regarded as too refined, and we will concede that the language covers two distinct cases, and these certainly exhaust all its possible meanings. First: If the people of a State should adopt a constitution and scheme of government which was not republican in form, the United States may interfere, and, under its obligations to the minority of the citizens of that commonwealth as well as to the citizens of all the other States, who have an interest in what concerns the whole country, may set aside the attempted government, and in some manner may establish, or permit to be established, another in its place which shall be republican in form. There is, of course, no pretence that this condition of affairs exists, or has existed, in Louisiana. Its constitution and governmental system are confessedly without fault, and were expressly approved and ratified by Congress. Secondly: The only other possible case would arise when a State constitution and government had been already adopted, republican in form, but by means of an organized and forcible resistance of sufficient magnitude to the lawful officers—a domestic insurrection, in fact—this government was prevented from administering the public affairs, and was either actually overthrown or was in imminent danger of being thus overthrown. Under such circumstances, the interference of the United States to repress the violence, to overpower the armed array, to quell the insurrection, and to restore and uphold the lawful authorities, might be considered as a mode of guaranteeing to the State a republican form of government. But this is also the very case provided for in the clause of the Constitution first quoted, which authorizes protection against domestic violence; and, plainly, neither the President nor the Congress has any authority, as a step in the suppression of the domestic violence, to sweep away the State laws and order and conduct an election. It is enough to say, however, in reference to this second case, that such a condition of affairs does not exist in Louisiana. There is no resistance, no attempt to overthrow the constitution or to abolish the government. The only controversy is between persons claiming to have been elected to certain offices, and this dispute is not different in kind from similar ones which have occurred in every State. No argument can add anything to the force of this simple and self-evident interpretation of the Constitution. The proposed action of Congress, the election ordered by it and conducted by national officials, would be a palpable, defiant violation of its spirit and letter. If accomplished and acquiesced in by the people, it would be a virtual declaration that our boasted organic law, with all its limitations and restraints, was a mere form of words, to be disregarded and treated with contempt upon every occasion when the necessities of party require it.

## "AN ALLEGED DICTUM OF COPERNICUS."

To the Editor of The Nation:

Sir: I must plead guilty to the charge of inaccurate citation alleged by "J. B. S.," and am much obliged to him for pointing out the error. It is hardly proper, however, to speak of Mr. Lewes as erring with me in attributing the dictum in question to Copernicus. In his 'Aristotle,' p. 92, it is true, Mr. Lewes appears to have regarded Copernicus as the author of the preface in which the dictum occurs, and he evidently cites it at second-hand, for he tells us that he does not remember where he found it. But in the 'Problems of Life and Mind,' p. 317, where he again alludes to the dictum, Mr. Lewes adds: "From Gassendi's work, 'Nicolai Copernici Vita,' 1655, p. 319, I find that the remark . . . was perhaps only due to Copernicus in the sense that he countenanced its publication, for it was not written by him, but by his disciple Osiander in the preface which he added when he gave the work of Copernicus to the public. It may therefore have been simply *une précaution oratoire* to render the heretical doctrine of the earth's movement less offensive." Possibly there may have been some covert sarcasm in the remark; *i.e.*, "It is not necessary, my theological friends, for our hypotheses to be true, in the absolute sense in which your dogmas are held to be true, for it is quite enough for us if we can reconcile theory with observation." The distinction here indicated is at least closely akin to the distinction between the scientific and the metaphysical points of view which I have taken pains to elucidate. But whatever Copernicus or Osiander may have had in mind, it is plainly myself only, and not Mr. Lewes, who is responsible for the inaccurate shape which my quotation assumed. Perhaps I should add that at just the time when in London I revised this part of my book or the press, I did not have either of Mr. Lewes's works at hand, and depended upon a pencil-note in my memorandum-book.—Very truly yours,

John Fiske.

Harvard College Library, January 15, 1875.

## A POLICY FOR LOUISIANA.

To the Editor of The Nation:

Sir: The leading article of the last *Nation* on "The Law and the Facts in Louisiana" closes with these unsatisfactory words: "As regards the proper mode of dealing with this question on the part of the public, it is difficult to know what to say." In this respect you seem to concur with the various speakers and public characters who have recently addressed the country on the subject. Have we not now had quite enough of "the law and the facts" in the case? Is not the one question the very question you

avoid? Here is a practical difficulty, and it calls pressingly for a practical solution.

My voice will not reach far amid the turmoil; but will you let me offer a suggestion? There are three parties, and three only, to this complication—the existing legislative and executive departments of the United States, constituting in fact the National Government; the people of the United States; and the people of Louisiana. The National Government now is, as the recent election shows, administered by those representing a minority of the people—the rump, in fact, of the once great Republican party. These men have apparently become bewildered by defeat, have lost their heads, and, seeking to settle everything through the decision of the caucus enforced by party discipline, are rushing as fast as they can upon their destruction. It is for the people to see that they do not carry the country there with them.

No calm and observing man can to-day doubt that a vast majority of the people are utterly opposed, on the Louisiana issue, to the existing Government. The adverse majorities of last autumn have quadrupled since the year 1875 began. One thing, and one thing only, can save the faction now in control of the Government—that one thing is a renewal of a fierce war spirit in the North, resulting from the violence of despair in the South. The relief of Louisiana is certain if no such reaction intervenes. At the outside, two years of patience only are necessary to bring the majority of the people of the country to the side of the people of Louisiana. Submission and patience are hard things; but for two years submission and patience it must be, or the result is in danger.

But what is to be done to-day? One thing that I can see, and only one, can be done. Let the Conservative Legislature of Louisiana give solemn notice to the whole world that they are now subjected by force to a usurpation, every act of which is null and void, and shall be so treated hereafter. Let them publicly declare that so surely as the day of relief comes, every debt contracted by the usurping government shall be repudiated, every tax-title issued set aside. Let them in one word publish to the world the existing administration of the State as a fraud, by no act of which will the people of Louisiana be bound, so soon as they are restored to the control of their own affairs.

This one solemn notice given, let the Conservative Legislature hold up its hands in submission, and disperse; the rest may be safely left to the people of the whole country. Two years is a short time, when at the expiration of it relief is sure. During that brief time let no Conservative of Louisiana go to the polls or enter a legislative hall; the worse their oppression, the better. Let them simply submit. They need not fear that a day of reckoning will not come; and then the Government of the United States and all public opinion will justify them in treating their present rulers as criminals, and each and every of their official acts as absolutely and *ab initio* null and void.—I am, etc.,

C. F. Adams, Jr.

Quincy, Mass., January 16, 1875.

## THE "ACADEMY" AND THE "CARDIFF GIANT."

To the Editor of The Nation:

Sir: My attention has been called to an article in the London *Academy* of December 5, which deserves wider circulation among American scholars than it is likely to receive in the columns of that journal.

The *Nation* of November 12 (p. 318), in a report of the American Oriental Society's meeting in New York, mentioned the "lively and amusing debate" that followed my review of "some recent discussions of the evidence of Phœnician colonization in America," and remarked that much astonishment was expressed by members of the society at Dr. Schlottmann's "accepting as genuine that exploded humbug, the 'Cardiff Giant,' . . . a false antique which was completely exposed years ago, and of which the true character is known to all well-informed persons in this country." This notice seems to have given offence to Mr. Alexander MacWhorter, of New Haven—who professes still to believe in the giant and in the "Phœnician inscription" of which he was the discoverer—and drew from him a letter to the New Haven *Palladium*, which was printed in that journal November 16. The *Academy* copies part of this letter, and gives an abstract of the rest, as evidence that "the statue of Adonis, discovered in America"—meaning the Cardiff Giant aforesaid—"still continues an apple of discord among American scholars." Mr. MacWhorter wrote that Prof. White, of Yale College, pronounced certain "stories of the recent manufacture of the statue, in plain Saxon, *lies*." The *Academy* makes this expression apply to "*all* the stories of the recent manufacture of the statue," and remarks: "This is the language which professors of the same university use towards each other in America." The final comment on the whole matter—which the *Academy* chooses to regard as "by no means settled"—is in the tone which some correspondents of that journal seem privileged to assume when dealing with "American scholars" generally:

"When will American scholars learn to speak gently? We read in the same number of the *Palladium* of a 'Lacerated Actress attempting to Cowhide an Editor': do the members of the American Oriental and Philological Societies behave much better?"

I take no exception to the largeness of the figure which presents the gypsum colossus as "an apple of discord," though I cannot but wonder how Flaxman would have treated it in outline. Fancy the good Dr. Schlottmann figuring—in the attitude of Persico's Columbus—as "Discordia tetra," poising in air the ponderous *malum* (the Latin word is convenient here), to bowl it back over the Atlantic, to the discomfiture of American scholars! But, as I have said, I do not object to the figure. To the statement—which Mr. MacWhorter's letter does *not* authorize—that, at the meeting of the Oriental Society, I "declared the Onondaga statue 'to be a false antique,'" etc., I have a right to object. The words quoted by the *Academy* are from the *Nation's* comment, not from my paper. I would as soon have "declared" my want of confidence in Barnum's "Mermaid" or Mark Twain's reported discovery of the grave of Adam.

No member of either the Oriental or the Philological Society has, so far as appears, spoken otherwise than "gently" of the giant, the inscription, or the discoverer. The language which Mr. MacWhorter attributes to Prof. White was, as the context most clearly shows, not used towards another professor in the same university, or in any other. The suggestions of the *Academy* on the points are, to say the least, uncalled for.

It is but justice to Dr. White to add that, far from using hard language towards all who pronounce the Cardiff Giant a "sham antique," he has not yet announced to the public his own *decided* belief in its antiquity. His first and last utterance, so far as I can learn, was by a letter he addressed to Mr. MacWhorter in 1871, before the true history of the statue was generally known. He then wrote: "I cannot say that it was *not* made (as some claim it was) within two or three years; but I could not be *satisfied* [the italics are his] with any such view." Again, "I am not, on the other hand, *certain* that it is a work of ancient art"; and finally, "Though not fully *decided*, *I incline* to the opinion that the statue is of ancient origin."

"Nothing would seem to be more natural," the *Academy* suggests, "than to wait till the matter has been fully investigated." Would it have been an excess of courtesy to assume that it *had* been investigated, and, to quote again from the *Nation*, "completely exposed, years ago"? Among the members of the Oriental Society present at the New York meeting were some "who were personally conversant of the main facts in the history [of the statue], who had seen and talked with the workmen in the Chicago shops where it was produced, who had examined the dim lines asserted to be an inscription, and found them mere scratches or water-marks," and so on. Mr. MacWhorter suggests, it is true, a doubt whether the "well-meaning citizens" who make up the Oriental Society are qualified to judge whether the inscription was Phœnician or not; but this consideration does not affect the real issue—to try which, any jury of well-meaning citizens of average intelligence is as competent as a full congress of German Orientalists, or the most valued correspondent of the *Academy*. Admitting that Professors Salisbury and Whitney, Dr. Woolsey, Dr. Hayes Ward, Mr. S. Salisbury, and their associates were none of them so "well informed, according to the German standard," as is Mr. MacWhorter, they may yet be qualified to pass judgment on the age of the statue, on evidence quite independent of the "inscription," real or imaginary. If they knew that the block of gypsum from which the *Adonis* was carved was taken a few years ago from a quarry near Fort Dodge, Iowa, and that it was fashioned in the workshop of Mr. Burckhardt, a well-known marble-worker of Chicago, it would be hardly worth their while to proceed to the "investigation" of the Phœnician inscription. To be "well informed" on these points, one has only to look through the files of any respectable journal of three or four years ago. In July, 1871, the editors of the *American Journal of Science* (Third Series, vol. ii., p. 73) "thought it worth while to record very briefly the real history of this sham, that it may find its place in the already large catalogue of popular delusions." The main facts of this record were "ascertained from an intelligent witness, who was cognizant of the origin and progress of the statue," and whose statement the editor "had taken pains to verify." I cannot learn that this statement has been controverted or its general accuracy seriously questioned by American scientists or scholars, Mr. MacWhorter excepted. But if further evidence were needed, it could be had in abundance. I have before me memoranda supplied by one who knew some of the parties to the fraud, and who was at the pains of

tracking the giant's progress, stage by stage, from the Iowa quarry to the exhumation at Newell's farm in Cardiff; showing the mode, cost, and date of transportation, and giving ample details of the process of manufacture. The complete gypsography may be worth printing for foreign circulation, now that Dr. Schlottmann has introduced "the exploded humbug" to German scholars, and the *Academy* elects to stand as one of the godfathers of "*the statue of Adonis discovered in America.*" For *this* side of the water the matter is already "fully investigated." The Adonis received its death-blow when Prof. O. C. Marsh, the palæontologist, of Yale College, who saw it before its exhumation, called attention to one fact which other visitors had overlooked—the fact that gypsum is soluble in water. The statue was found in wet ground, near the bank of Onondaga River. It was uninjured by the water in which it lay; *therefore*, its interment was recent. Such additional evidence as was offered by the *straw* which Prof. Marsh found mixed with the earth taken from the pit was not needed to assure him that the work was post-Phœnician.

So far from "continuing an apple of discord," the Phœnician Adonis is not likely to provoke any body of American scholars to other than a "lively and amusing debate," if that can be called debate in which all the speakers are of one opinion. Let me repeat what the *Nation* has said, in the article to which reference has been made: "If German scholars have been incautious enough to have been taken in by so gross a cheat, they have no one but themselves to blame for it."

J. Hammond Trumbull.

Hartford, Conn., Jan. 14.

# Notes.

Porter & Coates, Philadelphia, will publish in the course of the next few weeks an 'Elementary Philosophy,' by James M. Wilcox, Ph.D.; 'Social Science and National Economy,' by Prof. Robert E. Thompson; and Augustus J. C. Hare's 'Days near Rome.'——J. B. Lippincott & Co. have begun publishing, under the direction of the trustees of the Rotch bequest, a new edition of Swedenborg's theological writings. 'The Apocalypse Revealed,' in two volumes, is now issued.——The American Unitarian Association celebrate their half-century by publishing Channing's works in one volume of 931 pages at the low price of one dollar. A passage which we have chanced upon in the letter on the slavery question, p. 817, contains a tribute to the late Gerrit Smith which might well furnish an inscription for his tombstone: "A man worthy of all honor for his overflowing munificence, for his calm yet invincible moral courage, for his Christian liberality, embracing men of every sect and name, and for his deep, active, inexhaustible sympathy with the sinful, suffering, and oppressed."——The "monumental edition," as it is called, of Mr. John Carroll Power's 'Life of Abraham Lincoln' (Springfield, Ill.: E. A. Wilson & Co.), two-thirds of which is given up to an account of "the great funeral cortége," has a curious map "showing the birthplace and course of life" of Lincoln, and also the route of the cortége. The restricted area in which he acted out his part in the history of the country recalls the outcry of "sectionalism" brought against him as a candidate for the Presidency. Many of his predecessors, however, were no better travellers than Lincoln; and few, if any, personally inspected so large a portion (relatively) of the United States as had Washington before his election. ——The San Francisco *News-Letter*, in its pursuit of quacks, is preparing a complete medical directory, giving the names and qualifications of every doctor in the city. Those without diplomas, or with forged or purchased ones, are pilloried every week in the paper, under the heading: "Gentlemen, you call yourselves Doctors. Have you a Diploma?" A list of names and addresses follows.

—The annual report of the Librarian of Congress shows a total of 274,157 volumes, including duplicates, which, under the working of the copyright law, tend steadily to increase. They offer, however, this advantage in the proposed removal of the library from the Capitol, that a sufficient collection can be left behind for the immediate use of Congressmen. Mr. Spofford makes it clear, we think, that a separate building is a necessity, and that for public use and convenience it should be erected in a part of the city somewhat removed from the Capitol. Already more than "fifty thousand volumes are piled upon the floors, without space for shelving or arrangement," and a great number of maps and engravings are kept out of sight for the same reason. The librarian and his assistants are engaged on an abridgment of the titles of the card catalogue, preparatory to printing an exhaustive but condensed catalogue. A still more considerable work has also been undertaken, being no less than a complete index to the documents and debates of Congress. The search for materials for this purpose revealed the fact that "of the early documents up to the Fourteenth Congress, or from 1789 to 1815 inclusive, no two sets are alike, nor is there in any one place in Washington a perfect file of documents printed by order of Congress." After the last-mentioned date, the Library of Congress lacks only about one hundred and fifty volumes of having two copies of every document.

—The pamphlets in the Library are estimated at 53,000. How they are catalogued or kept does not appear, but as the subject is one of some importance, no less in private than in public collections, we append here an extract from the recent report by Mr. Julius Dexter, librarian of the Historical and Philosophical Society of Ohio in Cincinnati. The card system is used, he says, for bound volumes:

"The pamphlets are similarly catalogued, and their cards are consecutively numbered in red ink, while those of bound volumes are numbered in black ink. A glance at a card thus tells whether the title belongs to a volume or to a pamphlet. Each pamphlet is numbered to correspond with its card, and the pamphlets are then arranged, without regard to subject, numerically in pasteboard boxes, a little larger than the ordinary 8vo size, and about two and a half inches deep, with a common cover. When the box is filled, it is numbered on the outside end with the numbers of the first and last pamphlet within it, and placed flat upon the shelf. The next box filled continues the series of numbers, and goes on to the first box, and so on the pile is built up. Shelves break the pile at every fourth box, and thus in no case can more than three boxes require to be moved to get at any pamphlet. If any pamphlet is demanded, the card catalogue, arranged alphabetically according to author and subject, shows whether the library has a copy, and likewise the number of the pamphlet, which can then be obtained from the numerically arranged boxes without trouble. This arrangement of pamphlets keeps them clean and uncreased, and likewise makes them as accessible as bound volumes. There is also great economy of space in it. A series of reports may be scattered through a dozen boxes, widely separated, but the cards come together in the catalogue drawer, and readily indicate the place of each report."

—Part I. of Gen. F. A. Walker's Statistical Atlas of the United States (New York: J. Bien) relates to the physical features of the country, and is in artistic execution decidedly the finest of the series. The double map XIII.-XIV., for instance, showing the geological formation, is printed in nine colors, and is really beautiful to look at. Plate I.-II. of the river systems has a political significance given to it by the addition of statistics, in each case, of area, population, products, steam and water power, etc. What we may call the North Atlantic watershed, from Maine to the confluents of the Potomac, appears to have the largest population and the greatest amount of steam and water power. The South Atlantic watershed is the chief rice-producing district. The Gulf watershed east of the Mississippi is the cotton district *par excellence*. The Ohio basin takes the lead in tobacco and corn. The Mississippi Valley above St. Louis is the wheat granary of the continent; the same Valley below is the sugar-producing district. In area, the Missouri basin of course is foremost, with more than half a million of square miles. Those of the Colorado and Columbia, and the Great Basin, are nearly equal with each other and with the Ohio—from 200,000 to 300,000 square miles. The Ohio stands second in population. The Lake systems (E. and W.), the Arkansas, Gulf (W.), Rio Grande, San Francisco and Vancouver Bays, are some of the other subdivisions of this remarkable map, over which we must not tarry longer, though it would be easy to do so. Plate III.-IV. shows extent of woodland, emphasizing the lumber supplies of Northern Michigan and Wisconsin, the Adirondacks, Northern Maine, the pine forests of North Carolina, the Gulf forest belt from Florida to the Pascagoula River, the timbered regions of Oregon, California, and the head-waters of the Missouri and the Columbia rivers. The treeless Plains and Great Basin are conspicuous here, as on the following map for lack of rain (Plate V.) Plate VI. shows the frequency with which storm centres pass over given tracts E. of the 100th meridian. Here the stormy character of the Lakes and the St. Lawrence watershed is markedly portrayed, with the 46th parallel as the height of turbulence. Quite isolated is a stormy area in Nebraska including Fort Randall, Yankton, etc., of the fifth degree of intensity—the highest but one. Plate VII. is a chart of mean temperature, indicated by isothermal lines—36° at Pembina, against 76° at Matamoras. Plate VIII. shows mean temperature in the hottest and coldest weeks of 1872, by isothermal curves; the three hottest tracts being about Wilmington, N. C., the border line of Florida and Georgia, and the junction of Arkansas, Louisiana, and Mississippi. Chart IX.-X. exhibits curves of annual means of the barometer; Chart X.*a*, the curves of elevation of the United States. Especially interesting is the map of coal-fields east of the 100th meridian (XI.-XII.) The restricted area of the anthracite—in Pennsylvania and Rhode Island and

Massachusetts—is in broad contrast with that of the bituminous coal, which stretches from Pennsylvania to Alabama, and from Iowa to Texas, with connecting fields in Illinois, Indiana, Ohio, and Kentucky. These are still better shown together on Plate XIII.-XIV. before alluded to. With the present Part the Atlas is completed, so far as the graphic features of it are concerned. In preparing it Gen. Walker has had the co-operation of recognized authorities on the several subjects delineated, as he duly acknowledges. The text to illustrate the entire work is all that is now wanting to this admirable enterprise.

—Prof. Wilibald Grimm, of Jena, well-known to students of German theology, has published as one of Von Holtzendorff and Oncken's 'Deutsche Zeit- und Streit-Fragen' a valuable lecture originally delivered before his Jena students on 'Luther's Bible and the Textual Revision of it' (New York: L. W. Schmidt). He gives very interesting information about the German translation that preceded Luther's and Luther's execution of his work, describes the great effect his translation had at the time and continues to have upon his country's speech, and quotes, in conclusion, with criticisms, various changes made by the revisers. Numerous notes give copious references to the literature relating to Luther's translation, considered in its history and in its effect upon the German language. We are surprised and disappointed at the treatment this body of New Testament revisers has thought proper for the notorious text, 1 John v. 7: "For there are three that bear record in heaven, the Father, the Word, and the Holy Ghost: and these three are one." They have enclosed it in brackets with this note merely, that the "words in brackets are wanting in Luther's translation, and were added to it afterwards." Prof. Grimm says the revisers ought to have remarked that the words are wanting in the Greek also. Accuracy would have required them to say that there is not the slightest ground for supposing the words to be of apostolic authority; that there is no record of them before the fifth century; and that they occur in only three Greek MSS., the oldest of which, on good authority, cannot be referred to an earlier date than the eleventh century. Even Mr. Spurgeon can here teach the Germans boldness in accepting the sure results of criticism. He instructs his people from the pulpit that the text cannot be considered an integral part of the Bible.

—A remark by Prof. Grimm upon the Vulgate's choice of *supersubstantialem* as the rendering of *epiousion* (ἐπιούσιον) in Matt. vi. 11, suggests the curious reflection that in the petition in the Lord's Prayer, "give us this day our daily bread," the real authors of the petition in the mouth of English-speaking Christians are King James's translators, and we have no assurance that their word "daily" conveys the precise qualification intended to be applied in this petition for bread by the original author of it, nor is there a hope of our ever coming any nearer to the thought which at the time of making this prayer was in the mind of the Founder of Christianity. Any one may convince himself that this is true by looking into the commentaries. The word *epiousion* is practically a *hapax legomenon*, occurring elsewhere only in the parallel passage in Luke. Origen considers the word as invented by the Evangelist, but gives no etymology of it. If he is correct, and if Professor Hadley's dictum is also true, that the writers of the Gospels were men by no means scholars in Greek, it appears to be a justifiable conclusion that we must remain standing between the two etymologies proposed for the word, one of which derives it from the noun *ousia*, and the other from the participle *iousa*, "bread necessary for our subsistence," and "bread for the coming day." The latter rendering we should judge to have the weight of ancient testimony, as it occurs in the Arabic and Ethiopic versions, and especially Jerome says that in the *Evang. sec. Hebræos* the Hebrew word signifiying "to-morrow", stood here. On the other hand, there are objections to this interpretation, the commentators tell us, arising from the use of the phrase "this day" previously in the verse, and from Christ's command to take no thought for the morrow, although the argument against "to-morrow" from the last consideration may, as is clear, be pressed too far. There remains, then, the conclusion that in the Lord's Prayer, which we suppose we may say is for childhood at least Christianity, and whose different petitions are in general as familiar as anything in the New Testament, we are unable to say whether, when we use this special petition, our thoughts are at one with the thoughts that inspired the teacher of it. As specimens of the carelessness and the dogmatism with which commentaries may be written, we may perhaps point out here that Lange *ad locum* says it would be "of course a mistake to apply the passage with Olshausen and some of the Fathers to spiritual nourishment exclusively, or even to the Eucharist," whereas Olshausen actually says: "The reference to bodily nourishment, on which the existence of the whole man depends, should not be excluded—nay, it may even be regarded as the immediate one." A strange way Prof. Lange has of treating his neighbor. Olshausen, on the other hand, goes on immediately to make a remark which is one of a kind that tends to bring theology into disrepute with thinkers trained to observe after scientific methods: "But the spiritual food must be looked upon as included, since otherwise the important petition for the spirit of God would be entirely wanting in the prayer." The thing to know, the scientific thinker would reply, *pace* Prof. Olshausen, is not what the prayer ought to say, but what it does say.

—Father Augustine Theiner, Protestant-born (at Breslau, 1804), was by profession a Prussian cavalry officer, when he became a convert to Catholicism in 1831, and shortly afterwards took orders. Through various degrees he reached the post of archivist of the secret Vatican archives, and enjoyed the full confidence of the present Pope, and even, in the early days when Pius IX.'s leanings were notoriously liberal, his sympathy as against the Jesuits. These gentry, among their other misrepresentations, had studiously disguised the true character of the proceedings at the Council of Trent, to which the church mainly owes its organization and discipline and exact doctrine, and that tendency toward centralization to which the Œcumenical Council gave the finishing touch. The Jesuit Pallavicini, for example, in his history of the Council of Trent, took pains to conceal or falsify the speeches which many learned and prominent bishops made in opposition to the tendency just referred to. When Theiner obtained the Pope's permission to publish the original pieces relating to the Council, every obstacle was thrown in his way. He had gone so far as to set up a printing-office of his own in Rome with the aid of the Pope and of the Emperor of Austria, and had begun printing, when the Jesuits persuaded the former to revoke his permission, and the work was indefinitely postponed. Towards the close of his life, which ended only last year, Father Theiner renewed his labors in this direction, and having carried his manuscript to Agram, in Croatia, was superintending its passage through the press when death overtook him. Learned friends of his in that place resumed the work where he left it, and the report of the Council has now been published in two large quarto volumes.

## BROOKE'S THEOLOGY IN THE ENGLISH POETS.*

UNDER this title, Mr. Stopford Brooke publishes a series of lectures upon Cowper, Coleridge, Wordsworth, and Burns—lectures delivered to his London congregation on Sunday afternoons. The greater part of the volume is devoted to Wordsworth, who is treated of in eight out of the fifteen chapters. Mr. Brooke enjoys much reputation as an eloquent preacher of the extremely liberal school, and these discourses afford evidence both of his eloquence and of his liberality. They strike us as rather too fluent and redundant—the common fault of clerical writing; but they contain a good deal of sensible criticism and of suggestive moral analysis. Mr. Brooke does not always clinch his argument very sharply, but the sentiment of his remarks is usually excellent. His moral perceptions are, indeed, more acute than his literary, and he rather too readily forgives a poor verse on the plea of a fine thought. He gives us a great many passages from Wordsworth—the most prosaic of poets as well as the most poetic—in which the moral flavor has apparently reconciled him to the flatness of the form more effectually than it will do most readers. The author's aim has been to construct the religious belief of the poets from their works; but this aim, as he advances, rather loses itself. His "theology" merges itself in general morality—in any considerations not merely literary. With the exception of Cowper, indeed, we should say that none of the poets we have named had, properly, a theology; their principal dogma was that it is the privilege of poets to be vague. Coleridge, indeed, as a philosopher, "went in," as the phrase is, for the supreme sanctity of the Church of England; but Coleridge as a poet, in so far as he is now read or remembered, had little to say about creeds and churches. In a poet so vast and suggestive as Wordsworth we may find a hint of almost any view of the origin and destiny of mankind that one is disposed to look for; and we think that the author has made the stages and subdivisions of the poet's intellectual history rather too rigid and definite. Of course, Wordsworth was, on the whole, a Deist; but he was a Deist with such far-reaching side-lights into the realms of nature and of human feeling that one fancies that readers of the most adverse spiritual tempers must have often obtained an equal inspiration from him. Burns, as Mr. Brooke admits, was no positive believer at all, and he rests his interest in him on the fact that he was so manly and so human—so perfect a subject for redemption and salvation. Of Burns Mr. Brooke writes very well, and probably as few clergy-

* 'Theology in the English Poets. By the Rev. Stopford A. Brooke, M.A.' New York: D. Appleton & Co. 1875.

men—apart from certain Scottish divines, whose patriotism has anticipated their morality—have written of him. "He was always—like the Prodigal Son," says the author, "coming to himself and saying, 'I will arise and go to my Father'; but he never got more than half-way in this world."

Mr. Brooke glances first at the theological element in English poetry before Cowper. "The devotional element which belonged to Donne, Herbert, Vaughan, and some of the Puritan poets, died away in the critical school which began with Dryden and ended with Pope. The 'Religio Laici' of Dryden is partly a reproduction of the scholastic theology, partly an attack on the Deists, and it does not contain one single touch of personal feeling towards God." The author recognizes Pope's devoutness of heart; but he illustrates this same absence of the personal accent in his verse. To that of Cowper three things belonged: "Passion, the personal element, and the expression of doctrine." It is puzzling, at first, to be called upon to attribute "passion" to Cowper. Theological he was—terribly, fatally theological—but of how admirably he humanized his theology these lines, quoted by Mr. Brooke, are an example. Mr. Brooke contrasts them, for passion and personal feeling, with one of those familiar fine passages from Pope, in which the rhythm is that of the pendulum, and the philosophy so bent on keeping on terms with the epigram, that one loses half one's faith in its consistency. They seem to us extremely touching:

"I was a stricken deer that left the herd
Long since—with many an arrow deep infixed
My panting side was charged when I withdrew
To seek a tranquil death in distant shades.
There was I found by one who had Himself
Been hurt by the archers. In His side He bore
And in His hands and feet the cruel scars.
With gentle force soliciting the darts
He drew them forth, and healed and bade me live."

Mr. Brooke writes at some length on the poetry of Man and the poetry of Nature as the later poets of the last century handled them, and makes several very good points. They underwent a very similar development—a transition from the abstract to the concrete, from the conventional to the real, the general to the individual; except that Man, at the poet's hands, rather anticipated Nature. What the French would call "intimate" human poetry was fairly established by Goldsmith, with the help, later, of Crabbe; but Nature, as we look at her nowadays, did not really receive anything like her dues until Wordsworth began to set the chords a-murmuring. If the history of that movement toward a passionate scrutiny of Nature, which has culminated in England, in our day, with Tennyson and Browning, could be scientifically written, we imagine it would be found to throw a great deal of light on the processes of the human mind. It has at least drawn into its service an incalculable amount of ingenuity, of imagination, of intellectual force. There are descriptive phrases and touches in Tennyson and Browning which represent, on this subject, an extraordinary accumulation of sentiment, a perfect entanglement of emotion, which give the key, as it were, to a civilization. Mr. Brooke quotes from "The Ancient Mariner" several examples of Coleridge's subtlety of observation of natural phenomena, which are peculiarly striking in a writer of his loosely reflective cast. But, what with Wordsworth and Shelley and Keats, subtlety of observation was then in the air; and Wordsworth himself, moreover, is a proof that observation feeding on Nature, and meditation feeding on itself, are processes which may very well go forward in company. Mr. Brooke gives us as the last word of Coleridge's theology, after many vagaries:

"Oh! sweeter than the marriage feast,
'Tis sweeter far to me
To walk together to the kirk
In a goodly company!"

Of Wordsworth, Mr. Brooke writes diffusely—too diffusely, we think, for discretion; for there are reasons in the nature of things why a prolonged commentary on the author of the "Prelude" and the "Excursion" should have an air of superfluity. He is himself so inordinately diffuse that to elaborate his meaning and lead it through further developments is to double the liability to irritation in the reader. He ought to be treated like a vast enclosed section of landscape, into which the reader may be turned to ramble at his pleasure. The critic may give us a few hints—he may hand us the key; but we should advise his making his bow at the gate. In the fine places we wish to be alone for solemnity's sake; and in the dull ones, for mortification's. Mr. Brooke, who is evidently a most zealous and familiar student of the poet, undertakes to relate the complete history of his poetical development on the moral side. It is, of course, an interesting story, though it rather drags at times, and though its conclusion is, as Mr. Brooke admits, an anti-climax. The conservatism into which Wordsworth stiffened in the latter half of his career was essentially prosaic, and the "Sonnets to Order" read really like sonnets to order in another sense. But one is thankful for the opportunity of dipping into him again on any terms; for the sake of a few scattered lines of Wordsworth at his best, one would make one's way through a more importunate commentary than Mr. Brooke's. For Wordsworth at his best certainly soars at an altitude which the imagination nowhere else so serenely and naturally reaches. There could surely be no better example of the moral sublime than the lines to Toussaint L'Ouverture:

"Thou hast left behind
Powers that will work for thee,—air, earth, and skies;
There's not a breathing of the common wind
That will forget thee; thou hast great allies:
Thy friends are exultations, agonies,
And love, and man's unconquerable mind."

This is very simple, but it is magnificently strong, and the verses, beyond their intrinsic beauty, have for us now the value of carrying an assurance that they have played a part and rendered service—been a stimulus and an inspiration—to many readers. The author has, of course, much to say on Wordsworth's almost fathomless intimacy with Nature, and he quotes these lines in illustration of that imaginative force which had expanded, through years of open-air brooding and musing, to its amplest reach. Wordsworth is speaking of London and its vast human interest, which, to his mind, seemed filled

"With impregnations like the Wilds
In which my early feelings had been nursed—
Bare hills and valleys, full of caverns, rocks,
And audible seclusions, dashing lakes,
Echoes and waterfalls and pointed crags,
That into music touch the passing wind."

The author mentions elsewhere, among Wordsworth's inimitable descriptive touches, his saying of a lonely mountain lake:

"There sometimes doth a leaping fish
Send through the tarn a lonely cheer."

That alone seems to us, in trivial parlance, worth the price of the volume. It is fair to Mr. Brooke to transcribe a specimen of his criticism; the following seems to us a favorable one:

"Our greatest poet since Milton was as religious as Milton, and in both I cannot but think the element of grandeur of style, which belongs so pre-eminently to them, flowed largely from the solemn simplicity and the strength which a dignified and unbigoted faith in great realities beyond this world gave to the order of their thoughts. Coleridge was flying from one speculation to another all his life. Scott had no vital joy in his belief, and it did not interpenetrate his poetry. Byron believed in fate more than in God. Shelley floated in an ideal world which had not the advantage of being generalized from any realities; and not one of them possesses, though Byron comes near it now and then, the grand style. Wordsworth alone, combining fine artistic powers with profound religion, walks when he chooses, though he limps wretchedly at times, with nearly as stately a step as Milton. He had the two qualities which always go with the grand style in poetry—he lived intensely in the present, and he had the roots of his being fixed in a great centre of power—faith in the eternal love and righteousness of God."

Mr. Brooke intends, apparently, to take up the other poets in turn. Tennyson and Browning, as he says, are full of theology; and in the many-colored transcendental fumes and vapors of Shelley the theological incense mounts with varying density. But with Byron and Keats it will take some shrewdness to discover it. In treating of the theology of Byron, indeed, Mr. Brooke would have a subject worthy of all his ingenuity.

## PREHISTORIC MAN IN EUROPE.*

IN this volume of four hundred and fifty pages, Mr. Dawkins gives the results of his "researches on the evidence of caves respecting the early inhabitants of Europe." As was to be expected by those familiar with the author's previous publications, the present volume is a careful digest of the subject, containing not only his personal researches in caves and in bone deposits, which were many and thorough, but also an examination of the writings of other investigators both in Great Britain and on the Continent. The work is thus made a complete and critical review of the evidence of the antiquity of man in Europe; it being conclusively shown that in the old time of the palæolithic man the British Islands were connected with the continent of Europe, and formed a part of the great tract over which roamed the many animals since extinct or driven by change of climate to other quarters. The subject is a vast one, and needed just such critical treatment on geological and historical grounds as our author has given it, and certainly no one was better prepared by long and thorough research than he. After careful scrutiny of every fact that can be sustained on purely scientific principles, he has proved that man lived in Europe during the pleistocene age and hunted the mammoth, the woolly rhinoceros, the stag, the reindeer, and many forms of animals now extinct

* 'Cave Hunting. By W. Boyd Dawkins.' Illustrated by colored plate and wood-cuts. 8vo, cloth. New York: Macmillan & Co. 1874.

or only existing in remote regions ; and, so far as can be judged from the stone and bone implements and the engravings upon them, that this earliest race of men in Europe was akin to, if not the same as, the Eskimo of Arctic America.

Mr. Dawkins designates the several periods of time during which the caves have been occupied by man and beast as the historic, prehistoric, and pleistocene. He then considers the changes that have taken placé in the wild animals of the country from the time of Julius Cæsar, and the introduction of animals by man at various periods ; and these are referred to as forming most important data in determining the age of the deposits in the several caves containing their remains, associated with those of man. Along with this a very interesting table is given, showing the date at which each species was exterminated or introduced, as the case may be. The thorough examination of the Victoria Cave, and the way in which Mr. Dawkins relates the story in his work, form a most interesting chapter, covering the border-line of history and geology. We are here told how the caves were used as places of refuge by the defenceless people on the withdrawal of the Romans from Britain and the overrunning of the country by the Picts and Scots; and how, at last, when driven to despair, the inhabitants succeeded, in turn, in repulsing their Pictish and Scottish enemies, only to be conquered anew by the invasion of the English. All this time the caves were as important as places of retreat and shelter as they had been in the far earlier days before history gave names to the races who occupied them. The occupation of the caves during the historical period is thus summed up : "The relics must have been accumulated in the two centuries which elapsed between the recall of the legions in the days of Honorius and the English Conquest. They are traces of the anarchy which existed in those times, and they tell a tale of woe wrought on the Brit-Welsh by Pict, Scot, or Englishman, as eloquently as the lament of Gildas or the mournful verses of Taliesin. They complete the picture of the desolation of those times revealed by the ashes of the villas and cities which were burned by the invaders."

The historic period, during which the caves were occupied by known races of men, is but as a day in their vast history. Before this period many of them were inhabited, or used as places of burial, by the neolithic men, and previous to their time by a still earlier race, the first of which we have any record in Europe. While treating of the prehistoric period, or the second division in time in a backward series, the contents not only of the caves are considered, but those of the chambered tombs as well, and a thorough, critical essay on the characters of the skull and other parts of the skeleton is introduced, written by Professor Busk. This is illustrated by cuts, exhibiting the forms of the skulls and the peculiar flattening of the shin-bones, or platycnemism, which is now believed to be of less value as a race-character, and one more indicative of habits, than was supposed when its extreme form was first noticed in the skeleton of the now famous old man of Cro-magnon.

The relations of the two races of this period, the dolicho-cephali and the brachy-cephali, are thus summed up by Mr. Dawkins :

"From the examples given in the preceding pages it is evident that, in ancient times, long-headed men of small stature inhabited the whole of Britain and Ireland, burying their dead in caves, but more generally in chambered tombs. They were farmers and shepherds, and in this country in the neolithic stage of culture."

"No human remains of the brachy-cephali, or broad type, have been obtained from the caves in Britain. The evidence, however, is decisive that, in the bronze age, a tall, round-headed, rugged-featured race occupied all those parts of Britain and Ireland that were worth conquering, and drove away to the west or absorbed the smaller neolithic inhabitants. And the identity of their skull form, in the series of interments in the round and bowl-shaped barrows extending from the bronze age down to the date of the Roman occupation of Britain, shows that, both in the North and the South, this large-sized, coarse-featured people was in possession at the time of the Roman Conquest."

We cannot here follow in detail the contents of the sixth chapter of the work, in which the range of these two races of people is traced by a review of the evidence furnished from all parts of Europe, and therefore we give only the following conclusion of the chapter :

"In this outline of the ethnology of Gaul and Britain, it will be seen that two out of the three ethnical elements (if the Belgic be classed with the Celtic) of which the present population is composed, can be recognized in the neolithic users of caves and builders of chambered tombs. A non-Aryan race either identical or cognate with the Basque is the earliest traceable in these areas in the neolithic age, and it probably arrived in Europe by the same route as the Celtic and Germanic, passing westwards from the plains of Central Asia. There is no evidence of Spain having been peopled from Northern Africa, the identity of the Berber and Kabyle with the Basque being due to their being descended from the same non-Aryan stock in possession of Southern and Western Europe and Northern Africa. They are to be looked upon as cousins rather than as connected by descent in a right line. The Basque race was probably in possession of Europe for a long series of ages before hordes, either identical or cognate with the Celts, gradually crept westward over Germany into Gaul, Spain, and Britain, driving away, or absorbing, the inhabitants of the regions which they conquered."

In the next chapter, under the heading of "Caves containing human remains of doubtful age," in which group is classed those of Cro-Magnon, Engis, Neanderthal, Mentone, and others not so familiarly known, a careful consideration of the statements that have been made is given, and Mr. Dawkins is forced to believe that the interments in them do not indicate a greater antiquity than the neolithic time of the prehistoric period. Cannibalism is also alluded to in this chapter ; and from the evidence given by a cave on the Island of Palmaria its occasional occurrence at least cannot be considered as a "mere idle tale or poetical dream," though all the caves of Europe yet explored afford only "some three or four examples in the neolithic and bronze ages," while in still earlier times there is no well-substantiated evidence of the practice. The rest of this important volume is devoted to the evidence furnished of the earliest race of man in Europe, and here the author brings the great resources of geology and palæontology, which he has so well at command, into the most thorough service. The immense interval of time which elapsed between the pleistocene man and his successor of the neolithic age is discussed and made fully apparent ; the glacial period has also to be treated, in showing that this pleistocene race was unquestionably so closely connected with that period as hardly to leave a doubt that it was both a pre- and post-glacial race. Then the geological evidence of the submergence and elevation of certain districts is treated in full, and the effect that such changes have produced is vividly pictured, as in the following instance:

"The discovery of mammoth, rhinoceros, horse, Irish elk, bison, wolf, lion, and bear on so small an island as Caldy, indicates that a considerable change has taken place in the relation of the land to the sea in that district since those animals were alive. It would have been impossible for so many and so large animals to have obtained food on so small an island. It may, therefore, be reasonably concluded that when they perished in the fissures Caldy was not an island, but a precipitous hill, overlooking the broad valley now covered by the waters of the Bristol Channel, but then affording abundant pasture. The same inference may also be drawn from the vast numbers of animals found in the Gower caves, which could not have been supported by the scant herbage of the limestone hills of that district. We must, therefore, picture to ourselves a fertile plain occupying the whole of the Bristol Channel, and supporting herds of reindeer, horses, and bisons, many elephants and rhinoceroses, and now and then being traversed by a stray hippopotamus, which would afford abundant prey to the lions, bears, and hyænas inhabiting all the accessible caves, as well as to their great enemy and destroyer, man. We shall see in the ninth chapter that the elevation of the whole district above its present level is part of the general elevation of Northwestern Europe, and no mere small or local phenomenon."

The evidence of man in other regions at this early time is also given, as, for instance, in India and Palestine; and after a description, with figures, of many of the works of art, the implements of bone and stone, of this early race in Europe, and the character of the animals of the time, the comparison with the Eskimo is made resulting in the almost conclusive evidence that the Eskimos of North America are the same people as this oldest known race of Europe. To review this part of the work would almost be to copy it in full, and we must terminate an altogether too hasty notice with the following quotations from its concluding pages :

"No remains have been discovered up to the present time in any part of Europe which can be referred with certainty to a higher antiquity than the pleistocene age. The palæolithic people or peoples arrived in Europe along with the peculiar fauna of that age, and after dwelling here for a length of time which is to be measured by the vast physical and climatal changes described in the last three chapters, finally disappeared, leaving behind as their representatives the Eskimo tribes of Arctic America. There is no evidence that they were inferior in intellectual capacity to many of the lower races of the present time, or more closely linked to the lower animals. The traces which they have left behind tell us nothing as to the truth or falsehood of the doctrine of evolution ; for if it be maintained, on the one hand, that the first appearance of man as a man, and not as a man-like brute, is inconsistent with that doctrine, it may be answered that the lapse of time between his appearance in the pleistocene age and the present day is too small to have produced appreciable physical or intellectual change. Also, it must not be forgotten that we have merely investigated the antiquity of the sojourn of man in Europe, and not the general question of his first appearance on the earth, with which it is very generally confounded. Dr. Falconer well remarked that the *origines* of mankind are to be sought, not in Europe, but in the tropical regions, probably of Asia. To these we have no clue in the present stage of the enquiry. The higher apes are represented in the European meiocene and pleiocene strata by extinct forms, uniting in some cases the characters of different living species, but they do not show any tendency to assume human characters. It must indeed be

allowed that the study of fossil remains throws as little light as the documents of history on the relation of man to the lower animals. The historian commences his labors with the high civilization of Assyria and Egypt, and can merely guess at the steps by which it was achieved; the palæontologist meets with the traces of man in the pleistocene strata, and he, too, can merely guess at the antecedent steps by which man arrived even at that culture which is implied by the implements. The latter has proved that the antiquity of man is greater than the former had supposed. Neither has contributed anything towards the solution of the problem of his origin."

"The study of the remains which the caves contain has led to the recognition of the fact that the climate and geography of Europe in ancient times were altogether different from those of the present day. It has also made large additions to the history of the sojourn of man in Europe. We find a hunting and fishing race of cave-dwellers, in the remote pleistocene age, in possession of France, Belgium, Germany, and Britain, probably of the same stock as the Eskimos, living and forming part of a fauna in which northern and southern, living and extinct, species are strangely mingled with those now living in Europe. In the neolithic age caves were inhabited and used for tombs by men of the Iberian or Basque race, which is still represented by the small, dark-haired peoples of Western Europe. They were rarely used in the bronze age. When we arrive within the borders of history in Britain, we find them offering shelter to the Brit-Welsh, flying from their enemies after the ruin of the Roman Empire, and throwing great light on the fragmentary records of those obscure times. In treating of these questions, it has been necessary to discuss problems of deep and varied interest to the ethnologist, physicist, and historian, some of which have been partially solved, while others await the light of the higher knowledge which will be the fruit of a wider experience."

## RECENT NOVELS.*

THE reader of Mrs. Ames's voluminous story called 'His Two Wives' will not want for fine names. Cyril King and Ethelinda Kane, Vida, Circe Sutherland, and the Rev. Athel Dane, taken in connection with the places they frequent, viz., Ulm, Lotusport, and Tarnstone, ought to satisfy the most exacting demand for romantic nomenclature. The title and persons given, one easily divines the nature of the book, which is in fact a superfluously sentimental narrative of disastrous marriage, divorce, the husband's second wedding, and final reconciliation. The heroine, Agnes Darcy, is opportunely gifted with a talent for apprehending trouble with her husband; and, by consequence, she finds herself incompetent to ward it off when it comes. The tendency of her nose to become red when she is distressed, is represented as increasing the obstacles to a good understanding. Her husband, a gifted young lawyer, comes into notice as a politician, and is sent to Washington as a representative. Circe Sutherland stands for the siren who lures him from his wife's side; and Ethelinda Kane, being in love with him, but at the same time a trusted member of the household, acts the part of a "serpent in Eden" to increase the breach between them. When this breach has been duly widened, she discovers that she has only been assisting Circe to the hold upon his heart which she herself had coveted, and is finally turned out of doors by her. Meanwhile, Agnes has gone off with her "selfhood" and a reticule into the country, where she at once makes a hit in the millinery line, and follows it up by writing books—among them an extraordinarily good novel, which, if it were all it is here painted, we should vastly like to have had given to us by way of compensation. In this solitude she engages the affections of an intellectually proud young clergyman of the Episcopal Church, whom she cures of his previous arrogance toward women, though this does not, indeed, seem to have been very difficult of accomplishment. Here also she begins to feel a prescient dread of something about to happen, one winter's night; and immediately Ethelinda drives up in a sleigh, dying of consumption and anxious to make a confession of all her wiles. After this the husband has a stroke of paralysis, is neglected by his new wife, and Agnes returns to the house, thrusting her daughter into the sick man's room to take care of him, and then flying into the night again, despite their endeavors to make her stay. She embarks for Europe, and contrives on the way to witness the loss of a French steamer with Circe on board. Once across, she wonders why she does not hear from her daughter, who promptly appears, with her crippled and repentant father. They then go home, settle down, and talk over the whole matter good-humoredly; the clergyman concludes to marry the daughter, instead of Agnes, whose returned husband playfully pretends to be jealous of him. We must credit Mrs. Ames with a certain energy of delineation, but it is a desperate and gasping energy, which has suppressed all sense of humor, and has consequently admitted absurdities of which she appears to be unconscious. Her absorption in her work is doubtless a good sign, but we should hail it more hopefully were it not true that her story is very poorly constructed and the development of character clumsily managed. Her literalness of representation (in one place descending to a conversation on soothing syrup) is frequently dreary; and the book is distinguished by the fault common to the most of such accounts of commonplace domestic quarrelling, that of taking what we may call the bedroom view of life. On the whole, therefore, we do not see in this first effort any promise of satisfactory artistic achievement in what the writer herself would describe as "the ultimate."

Of 'The Lost Model' it is quite impossible to give any coherent account. It is written in a sort of "talented-young-man" style, and runs glibly through a maze of ordinariness and vulgarity difficult to describe. Among the numerous and insignificant personages introduced is the wife of an unscrupulous newspaper editor. She has previously had an amour with one Redwood, and has allowed the editor to buy her for his wife, with an understanding that she is to remain disloyal to him; and this is the way in which she talks to Redwood:

"Do you know what I was thinking of, Albert? Listen. I wish in my heart that Leonard would lose every cent he owned in the world, and then, my dear boy, he would sell me to you for a hundred dollars."

The first part of the book leads up to the murder of this lover by the husband. Not that this has anything to do with the story; but nothing which occurs in the course of it has, so far as we can discover. A girl called Renata seems to be intended for the heroine; and a mysterious creature, Parthee by name—whether Indian or Spaniard is not made clear—floats before us as the "lost model." He acts as model to a sculptor (who also has nothing to do with the story), and is "lost" in this way: toward the end of the novel he is depicted as going away for a year or two, leaving Renata in love with him, and promising to come back; after which he—or his ghost—returns abruptly on the eve of her wedding with another man, and vanishes in a thunder-storm, leaving her dead. The entire production is marked by a saturnine dissatisfaction which makes it extremely profitless reading. Its realism is of a kind that would recognize in cigar-ends and bar-room sawdust matter highly congenial to the novelist's purposes. Twice or thrice in the space of nearly four hundred pages the writer strikes out a brief spark of fancy, and we suppose a bit of symbolism to be intended in Parthee, who is perhaps conceived as a model of some finer race, lost to the worthless beings about him. But so little of this is conveyed that we feel in some danger, through attributing it to the author, of diverting from ourselves the credit of what has really been a stout effort of the imagination, viz., the apprehension of this symbolism. Whatever he may have intended, he has not had the skill to render it distinctly visible. As it stands, the book is the most bewilderingly imbecile imitation of a novel which we have for some time past encountered: yet it may chance to be of use to aspirants for distinction as American novelists, emphasizing as it does through its errors the necessity of great æsthetic stability in the American writer of local and realistic fiction, to enable him to resist the confusing haste, impermanence, and vulgarity of some of those phases of life he is to deal with.

In turning from this volume to Norman Macleod's posthumous 'Starling,' one sees by the light of sharp contrast how much it is in a novelist's favor to have settled social custom to rest upon; for we fancy it is largely from that source that the little story draws its wholesome quietness and solidity. To this is added a fair measure of literary skill, however, which is by no means so unimportant a factor of success as many of our indigenous geniuses would seem to consider it. Thus it happens that a careful, educated writer, not confused by the notion that with him alone rests the duty of revealing to the world the real nature of an entire national life, is able to make a credible and sufficiently entertaining story out of the love of an old soldier and his wife for a bird which excited some Scotch children to noisy merriment on the Sabbath, and which the parish minister held should be put to death. The disgrace and anxiety which for a time overshadowed them, and the circumstances that brought all right again, are detailed with a good deal of obviousness of edification and some padding, it is true, yet with the ease and completeness that come of a good school. We cannot, of course, countenance the appropriation of Sheridan's *bon mot* about drinking "like beasts" (p. 346) as original wit in the comedy man of the story; but in respect of construction and simplicity of key 'The Starling' is commendable, and will doubtless be read by many young people and some older ones who do not expect more than they can get from Dr. Macleod's tales.

A short novelette "from the German" closes our list, which bears the rather wandering name of 'Memories.' It relates in reminiscent form the love of a young man for an invalid princess, who, after much hesitation, consented to marry him. The stress of emotion, however, put an end to

*'His Two Wives. By Mary Clemmer Ames.' New York: Hurd & Houghton. 1875.
'The Lost Model. A Romance. By Henry Hooper.' Philadelphia: J. B. Lippincott & Co. 1874.
'The Starling. By Norman Macleod, D.D.' New York: Dodd & Mead.
'Memories: A Story of German Love. Translated from the German by George P. Upton.' Chicago: Jansen, McClurg & Co. 1875.

her existence. There is little art and little life in the book; but it has that distant prettiness which belongs by birth, one would say, to German writers of idyllic prose.

## THE NORTH AMERICAN REVIEW FOR JANUARY.

GENERAL W. B. HAZEN contributes to the current number of the *North American* an article on the "Great Middle Region of the United States," in which he incidentally discusses the land-grant of the Northern Pacific Railroad. It is an article which the creditors of the Company will hardly find agreeable reading, or feel inclined, during the present session of Congress, to distribute as a broadside or tract for the dissemination of useful knowledge. Nor will the leading journalists, Congressmen, or prominent men who a few years ago were transported over the line of the road, be much pleased with General Hazen's way of speaking of them; for, while he disclaims all intention of accusing them of dishonesty, he does this at the expense of their brains—the two horns of the Congressman's dilemma being, in this case as in so many others, knavery or ignorance. Most of our readers remember probably the great official excursion over the Northern Pacific line, which brought back accounts of a wonderful region, variously called the "Northern tropical belt," "the continental wheat-garden," or, with vulgar and contumelious exaggeration, since the bankruptcy of the road, "Jay Cooke's banana belt." It was, indeed, according to the maps distributed by the road, and the glowing accounts published from time to time, a pleasant land, with its summer isothermal line of 70° Fahrenheit, its fertile soil, its equable climate, and its prospective fields of waving grain. General Hazen, however, happened to be stationed at Fort Buford, on the Missouri, some two years ago, a post which is in the midst of the region in question, and his description of what he saw and felt makes it clear that considerable violence has been done to the isothermal lines and to the truth of science by those who have had in charge the preparation of reports. The hay-contractor, he says, in order to gather nine hundred tons of hay for the post, found that some twelve hundred square miles of the tropical belt was needed to furnish the supply, or, in other words, that one square mile of the continental garden produced three-quarters of a ton of hay. Besides this, the isothermal line of 70° Fahrenheit, the happy effect of which on the climate has been so often mentioned, and which, according to the railroad statistics, touches 51° N. lat., in reality passes through the post on the same meridian at 48° N. lat., or 180 miles further south. The spring, autumn, and winter isothermals, too, have not been generally furnished to emigrants, nor is any reference usually made on the railroad maps to the summer extremes (104° in the shade) or to the frosts which occur "nearly every month." The mean annual temperature is, according to General Hazen, 45°, and he speaks of having winter weather of 37° to 40° below zero, and terrific winter storms. These wide divergences between fact and representation General Hazen explains in this way:

"It has been common to make up excursion parties of newspaper-men, members of the Government, and citizens of large influence (always in the green months of May and June), to visit these sections. The roads all lie along the valleys of streams, and at that season give the idea of fruitfulness. These persons are never taken on transverse routes, where they would invariably find sterility, nor are they practical agriculturists. After an excursion of this kind, where every human want is anticipated, the press would be unnatural not to applaud, and the members of the Government mean, not to encourage, the enterprise. An obligation has been laid upon them all, and they have only seen the country at its best points and in its holiday dress. Men in high places have been employed, and paid for their services, in writing and speaking for these enterprises, and their writings and speeches used as advertisements in disseminating this deception. Their names are synonymes of honor and truth, but they, too, are deceived, and are made to deceive others innocently."

All this is very true, and General Hazen's indignation at the misrepresentations practised on the public with regard to that road will be shared by most people who read the article. At the same time, we confess to being left in considerable doubt as to the value of the grant even now, for General Hazen admits that some of it is good, and the principal German expert, whose official report was unearthed last year, did not question the value of the property, but denied the possibility of developing it rapidly enough to carry the enormous debt. The facts given in the rest of the article are worth attention, showing as they do that the occupation of the arable land in the "great middle region" between the Mississippi Valley and California has gone so far that the time has come, or is rapidly coming, when good land is no longer to be had for the settlement.

The "Reign of the Ring" is the title of the second of the series of papers called "An Episode in Municipal Government" which Mr. Charles F. Wingate, with the advice, consent, and assistance of Mr. Charles F. Adams, jr., is contributing to the *Review*. If all the members of the "old New Yorkers," "Knickerbockers," and "Dutch families" who, for the fifty years down to the time of the war, neglected their political duties and shirked all responsibilities except that of becoming richer than they had previously been, would read these articles with care, they would probably get some adequate idea of the utter scorn and contempt and loathing with which the municipal government of this city during the Ring period will be looked back to by the older New Yorkers and Knickerbockers and Dutch families of a generation hence, when the excitement evolved by the actual struggles of the thieves over the plunder and the public with the thieves has passed entirely away, and nothing is left but foulness and stench. The plain fact about Tweed and his fellows was that they were a gang of land thieves, gathered together from all quarters of the globe to plunder a rich corporation; that they plundered it with the aid and connivance of the respectable classes in the city, the chartered organs of public opinion, judges of the courts, and philanthropic reformers, whose support they got partly by bribes and partly by themselves promising to reform as soon as they secured money enough; and that this went on glaringly and publicly until one of their own members, not satisfied with his share of the spoils, "peached." It is on this account that we object—and it is almost the only thing in these articles with which we are inclined to find any fault—to the tendency to propitiate the national vanity, at the expense of the national good-sense, by magnifying the thieving and perjury and murder of the gang into something historically grand, picturesque, and "imperial." "No corruption was too direct and brutal for them; nor was any finesse too delicate"—"His [Tweed's] associates paled into insignificance in the glare of his splendid activity"—"He had now fairly entered upon the full career of success, and was at the climax of his glory." The satire seems to be here a little too grandiose for gentlemen who were familiarly known among themselves as "Mike," "Hank," "Prince Harry," "Thunderbolt," and "Crow," not to speak of aliases used for legal ends—a motley congregation of pimps, thieves, murderers, jail-birds, blacklegs, fences, and ruffians.

In an article on the "wage-fund theory" Mr. F. A. Walker makes a lively attack on some of the received doctrines of political economy. The theory as generally stated is that there is always a portion of the capital of any given country which is needed and set apart for the payment of wages; that this fund is divided among the total laboring population applying for employment; and, therefore, if the supply of labor increases without a corresponding increase of capital, the rate of wages (the amount received by each laborer) will fall; if the conditions are reversed, the rate will increase. Mr. Walker wishes to have the term wage-fund discarded from political economy, for reasons which he explains at considerable length. As we understand him, he objects to the wage-fund theory that it is false because

"It excludes altogether the contribution which the new-comer, the additional laborer, makes to the production of the community in which he is so unwelcome an arrival. The wage-fund doctrine regards him as a pure addition to the divisor, without recognizing the fact that his labor must also add something to the dividend. He no longer contributes more, far more to production than the cost of his own subsistence, as in an advancing state of industry, before natural agents are fully occupied and employed. He no longer contributes as much as he requires. But he still contributes something, and that something, however small it may be, helps to swell the amount that can be paid in wages"—

and because "in all new countries, excepting only gold-producing regions, the wages of labor are paid in a small degree only out of capital, the results of previous industry, but mainly out of the product of current industry." He appears to believe that the theory of the wage-fund is the direct product of some special conditions of English industry, and is not to be regarded as an economical law at all in the sense that it was originally propounded. To any one who supposes that the "wage-fund," as it is generally understood, means a quantity of money "already existing," "definite in extent," and "dedicated to a specific use," and that the capitalists of a country pay labor by first counting this up, then counting the number of men applying for work, and dividing one sum by the other, Mr. Walker's article would be likely to contain much salutary information; and the same thing might be said of any one who deduces, as a consequence of the wage-fund theory, that strikes and trades-unions can never under any circumstances affect the rate of wages paid in particular trades; but there are probably few people nowadays who believe this. Not even the most cold-blooded economist would advise a laboring-man who thought himself underpaid that the true way to find out what his wages must be would be to ascertain the amount of capital in the country, and the number of laborers, and then divide the one by the other.

He would no more do this than he would say that because of the general law that profits tend to equalize themselves in various industries, therefore no one could ever expect to get more than seven per cent.

The number also contains an interesting account of Mr. H. H. Bancroft's great work on the native races of the Pacific States, by Mr. Francis Parkman; a review of Henry Wilson's 'Slave-Power,' by Mr. James Freeman Clarke; and some book-notices, among which is an interesting review of Cairnes's 'Principles of Political Economy.'

*What I Did with My Fifty Millions.* By Moses Adams. Edited from the posthumous MS. by Cæsar Maurice, Esq., of the Richmond (Va.) *Whig.* (Philadelphia: J. B. Lippincott & Co.)—Criticism of this production from north of Mason and Dixon's line is disarmed by the heading of the title-page—"For Virginians Only." It is but proper, therefore, to defer to Southern and particularly Old Dominion opinion of the author and his work; and fortunately this is furnished us in advance of the text. Dr. G. W. Bagby, according to the Bristol *News*, "is the Mark Twain of Virginia"; according to the Norfolk *Virginian*, his "genius is akin to Lamb's," and he "stands pre-eminent as *the* essayist of Virginia, the pen-painter of Virginians, their life and manners, their foibles and their virtues." As for the purpose of the present work, the preface tells us that "those who read between the lines (as the French say) detect in all Moses's phantasies a lurking satire on the disposition made by poor old Virginia of her 'fifty millions' on internal improvements." With the light thus afforded us we have read the fifteen "instalments" of Dr. Bagby's serial (originally published in the *Whig*). We cannot say that we have found it as amusing as the 'Innocents Abroad,' or that we were loth to lay it down so long as any instalment remained unread. Virginians only, we were soon convinced, were capable of being enchained or convulsed by it; in other words, that the humor of "Moses Adams" was dependent on local scenes, personages, and events which non-native or non-resident readers could not possibly appreciate. The latter must be interested in it, if at all, chiefly as a study of provincialism (we borrow the word from the Norfolk *Landmark*, for we would not go a step beyond our Southern guides). It represents, in fact, a state of society in Virginia in which everybody, his history and affairs, are known to everybody else in the community. As such, it has a certain value, and its value will increase as this transient condition vanishes. Dr. Bagby's "pen-pictures" of the already obsolete or obsolescent manners and customs of Virginia are spirited and faithful, and here and there, as "local color," one detects words and phrases which the student of Americanisms has learned to associate with the Southern portion of the thirteen colonies. The Doctor's sentiment can be commended without labelling it Elia, and his invention of the automaton of Commodore Porter may justify his reputation as a humorist. More than this we hesitate to say, for the reason stated in the beginning.

*Literaturgeschichtliches Lesebuch* für deutsch-amerikanische Schulen, von Karl Petermann. (New York: L. W. Schmidt.)—A reading-book of German literature, designed for German-American schools, might easily show a bias more *doctrinaire* than literary. This is not the case with Herr Petermann's compilation. Naturally, his selections and brief biographical notices—especially in the second part, from Uhland to the present day—are in sympathy with the liberal sentiment and patriotic revival in Germany during the last half-century, and of course during the past few years. Thus we have Rückert's "Geharnischte Sonetten" and Freiligrath's "Hamlet," along with Becker's "Der deutsche Rhein," Strass's "Lied von Schleswig-Holstein," and Schneckenburger's "Die Wacht am Rhein," representing so many stages in the progress towards German unity. A certain number of authors are mentioned whose lives as well as writings are particularly associated with the United States, such as Karl Postel ("Charles Sealsfield"), and Friedrich Gerstäcker. Among these it would have been pleasant to meet with the name of Dr. Friedrich Kapp; but historical works are not reckoned part of the "Literatur" in which Louisa Mühlbach's productions are included. Dr. J. G. Kohl, another temporary sojourner in this country, and an antiquarian who was employed by the State of Maine on the history of its early discovery and colonization, finds a place in this reading-book, and on the faith of Herr Petermann we must conclude that he died in 1873, though his death has been more than once announced only to be contradicted. A pretty full sketch is given of Bodenstedt, whose 'Songs of Mirza-Schaffy' has occasioned a pleasant literary mystification (see the *Nation*, No. 300). The poetical print of this reading-book is too fine for even German eyes, let alone German-American. We have remarked a few typographical errors which need correction, the worst instance being 1772 instead of 1792 as the date of Gustav Schwab's birth.

BOOKS OF THE WEEK.

FOR

AGRICULTURAL IMPLEMENTS, MACHINES, SEEDS, AND FERTILIZERS,

address the above at 189 and 191 Water Street, or P. O. Box 376, NEW YORK CITY.

*HARPER'S CATALOGUE.* The attention of those designing to form libraries, or increase their Literary Collections, is respectfully invited to Harper's Catalogue, which comprises a large proportion of the standard and most esteemed works in English Literature—*comprehending over three thousand volumes.*

Librarians who may not have access to a trustworthy guide in forming the true estimate of literary productions, will find this Catalogue especially valuable for reference.

The Catalogue is arranged alphabetically by the authors' names, anonymous works by their titles. The index is arranged by the titles of the books, besides having numerous appropriate heads, each general head being followed by the titles of all works on that subject.

Harper's Catalogue sent by mail on receipt of ten cents.

Address HARPER & BROTHERS, Franklin Square, New York.

*DETERMINATIVE MINERALO*gy and Blowpipe Analysis.

JOHN WILEY & SON,

15 Astor Place, New York,

Have now ready:

*MANUAL OF DETERMINATIVE* Mineralogy, with an Introduction on Blowpipe Analysis. By Geo. J. Brush, Professor of Mineralogy in the Sheffield Scientific School.

"This constitutes, in accordance with the original plan of Prof. Dana and myself, the Determinative Part of his System of Mineralogy."

1 vol. 8vo, cloth, price $3.

☞ Copies for examination, with reference to introduction, will be sent to Professors and Teachers free by mail, on the receipt of $2.

*Supernatural Religion:*

An Inquiry into the Reality of Divine Revelation. Fifth London Edition, published in conjunction with Messrs. Longman & Co. 2 vols. 8vo, price $8.

From the *Fortnightly Review.*

"Hence the remarkable importance of the two volumes before us, of which it is not too much to say, and this may be admitted by believers as well as unbelievers, that they are by far the most decisive, trenchant, and far-reaching of the direct contributions to theological controversy that have been made in this generation."

From the *Spectator.*

"We give a hearty welcome to this learned and able work. So far as we know, it is an unparalleled specimen in the English language."

From the *Pall Mall Gazette.*

"The vast erudition alone which the author displays would be sufficient to place the work beyond power of imitation by all who have not devoted years to the close study of theological literature.

The publishers invite attention to the most remarkable religious work which has appeared since the publication of 'Ecce Homo.'

Sold by all booksellers, and when not to be found, remit the amount direct to the publishers, who will send it post-paid.

ROBERTS BROTHERS,

143 Washington Street, Boston.

# The Nation.

*NEW YORK, THURSDAY, JANUARY 28, 1875.*

## The Week.

SENATOR SHERMAN has written a very remarkable letter to the *Financier*, replying to the criticisms of that journal on his finance bill recently passed. In it he says that "neither the fractional currency nor the eighty-two millions redeemed can be reissued, and that he stated so when the bill was pending under debate, and no lawyer could put a different construction on the bill." Now, if the report of the *Congressional Record* be correct, Mr. Sherman, on being pressed by Mr. Schurz and Mr. Bayard on this very point, fenced with the question; he did not say that the eighty-two millions "could not be reissued"; he said "frankly that he did not propose to decide that question in this bill"; "that the question would be met" when "the time arrived." On the contrary, he left "every senator to decide for himself what the law was," *i.e.*, whether the notes could be reissued under the term "redeemed," and "if there was a doubt about it," he said, "it was not wise, as practical men dealing with practical affairs, seeking to accomplish a result, to introduce into the bill a controversy which would prevent the unity necessary to carry out the good that is contained in the bill." Now, we think this fully justifies the application of the term "evasion" to the bill, of which Mr. Sherman complains. He says now that no lawyer could put a different construction on the phraseology of the bill on this point, which is a very singular assertion. We must remind him that this very question arose under the act of 1866, on the interpretation of the word "retire," and that Mr. Boutwell put his own meaning on it, and began issuing old greenbacks as fast as he pleased; that the Finance Committee of the Senate reported, by five to two, that he was wrong in his construction of the law; but that he, thinking himself as good a lawyer as any of them, paid no attention to them, and his political son, Mr. Richardson, followed his example. We can understand why Mr. Sherman drew the bill as he did, and defended it as he did; but why he should have written this letter to the *Financier* puzzles us greatly. He also says that last session "the press scolded Congress for their long and fruitless debates on finance, so this session they resolved they would pass a bill without much debate." It is difficult to understand the state of mind in which this was written. The press scolded last year because months were occupied in debating whether we would ever return to specie payments at all; this year the press demands debate on the best mode of returning to specie payments. The two questions may be covered by the general term "finance," which is what has evidently imposed on Mr. Sherman; but they have no real connection. If a man were to pass months studying astrology and casting nativities, would any newspaper which found fault with this mode of passing his time be estopped from asking him to acquaint himself with the Copernican system of astronomy, on his proposing to take charge of the Naval Observatory?

In view of the revelation, both by the wording of the act and Mr. Sherman's language in the debate, of a loophole through which some future Boutwell or Richardson may pour out the "redeemed" greenbacks whenever it seems desirable to "ease the market" or "move the crops," and in view of the upward tendency of gold, we would once more call the attention of persons lending money payable at distant dates to the desirableness of doing business on a gold basis. If the community are not ready to contract in gold, as in California, it is very easy to draw a contract limiting the depreciation of legal-tender notes, and to give the holder of the security the option of placing his obligation upon a gold basis at the present price of currency. Payment of mortgages can be extended by an agreement on the part of the mortgagor "that at all time and times hereafter whenever any instalment of principal or interest now due or hereafter to become due may be tendered or demanded, the mortgagee may elect to receive payment in the gold coin of the United States of America of the standard in weight and quality designated in the Act of Congress of the United States, known as the Coinage Act of 1873, at the rate of eighty-eight gold dollars for one hundred dollars in United States notes, commonly called legal-tenders." Leases, promissory notes, and all obligations can be drawn on the same principle, which would be prudent and expedient when payable at a distant period of time, or in the apprehension of great fluctuation in the value of paper-money from commercial causes or unwise legislation. Our savings-banks hold very large investments in matured bonds and mortgages which now could be secured against any very serious depreciation. It is a sacred duty which the trustees of those institutions owe to the community to protect the savings of the poor from even the remote and possible bankruptcy of the future. The plan has already been adopted by many persons, and is working successfully. We have before us at this moment a form of agreement used (by a gentleman who holds a large number of trusts) in all extensions of mortgages now made by him, from which we have quoted the above phraseology.

Among the remarkable results thus far of the senatorial contests pending in various States has been the election of Mr. Cockrell, formerly a Confederate general, to succeed Mr. Schurz. Mr. Cockrell has of course no pretensions to Mr. Schurz's knowledge, ability, and experience, and enters the Senate solely as "a simple-minded, sagacious man," and a good fellow, who is liked by his old comrades. He made a plain speech after his election repudiating all love of extreme courses. General Burnside has succeeded after a prolonged contest in Rhode Island, and is personally unexceptionable. One struggle which was very fierce, that in Tennessee, has had a comical conclusion in the election of our old friend Andrew Johnson. Most people will smile on hearing this, and "the greatest criminal of the age" will probably for the next six years perform the harmless duty of amusing the people whose liberties he was supposed six years ago to be on the point of destroying. Mr. Dawes has obtained Mr. Sumner's seat, somewhat unexpectedly, partly owing to the mistake of the Democrats in losing time over a complimentary vote. If they had done at first what they showed a willingness to do at last, Mr. Adams would probably have been elected. Mr. Dawes was guilty last fall of the worst offence of which an American politician can at this juncture be guilty, and it came on the heels of several other offences of the same character, though less in degree. The support of him, therefore, by such papers as the Boston *Advertiser*, is another illustration of the hopelessness of what is called "reform within the party." Mr. Kernan, who goes to the Senate from this State, is an able and honest gentleman, a Catholic of Irish descent, and a lawyer by profession. Mr. Randolph is a good selection in New Jersey, though he took part in the Greeley movement, and made some odd speeches in it.

In Congress, a great many speeches have been made, and more are still making, on the Louisiana question. The Senate has resolved to confine speeches on the Appropriation Bills to five minutes; has killed the measure for creating a new Bureau of Statistics and Commerce, and passed the bill making Patchogue, L. I., a port of entry; and discussed Senator Morton's bill providing for a constitutional amendment to popularize Presidential elections. In the House, on Judge Hoar's motion, a committee of enquiry was appointed to report on the arrest of witnesses subpœnaed before Congressional Committees. The House has passed the "Little Tariff" Bill, and also a bill for the relief of the *Polaris* survivors; has agreed to the repeal of the Pacific Mail subsidy; and voted down a one-term resolution. Both Houses

received a message from the President recommending appropriations for heavy guns for sea-coast fortifications.

---

The reckless and carpet-bag element in the Republican party got up some strange plans in caucus last week, and proposed to modify the rules so as to cut off all dilatory motions during the remainder of the session, and thus give the control of the House to the majority, and enable it to push through in hot haste a series of somewhat audacious measures, such as bills upsetting the State governments, authorizing the President to suspend the habeas corpus, and making a combination of any two persons to commit an unlawful act a case of "invasion" or "insurrection" calling for the use of the army and navy, and making appropriations for two years, so as to deprive the next Congress of the control of the public expenditures. These schemes were rendered all the more outrageous by the fact that the present Congress is a genuine Rump—that is, a legislative assembly from which the voters have formally withdrawn their confidence. Whether this is to be regretted or not, it is a fact which members of Congress, like other citizens, are bound to respect, and all legislation therefore of the "snap" kind performed before March 4, and intended to settle leading questions of the day which were before the country at the last election, so as to deprive the new Congress of the control of them, is morally fraudulent. The desperadoes introduced their resolution to alter the rules in due course, Mr. Cessna characteristically moving it, but, as it required a two-thirds vote, they were defeated by the aid of sane Republicans, by 98 to 150—a narrow escape.

---

The official correspondence on Louisiana sent to the Senate by the President contains some very startling documents. It opens with a telegram from General Emory, dated December 16, to the following effect: "Since my despatch of yesterday, information comes which I think justifies the conclusion that personal violence and armed conflict will not be used by the contending parties to settle the pending political troubles in this city"; while on December 24, Lieutenant-Colonel Morrow, specially detailed to proceed to the Red River country and make a thorough examination of the condition of affairs, having returned to New Orleans, and maturely considered the subject, reported that there was no need of more troops in that neighborhood. His words are:

"The present State government cannot maintain itself in power a single hour without the protection of the Federal troops, and even with this protection they will not be able to collect taxes and perform the functions of government. The State government has not the confidence or respect of any portion of the community." Further on, he says: "If the expressions of the people are to be believed—and I do believe them—there is a very sincere desire to live quietly under the protection of the Constitution of the United States, and to enjoy the blessings of the national Government; but there is no disguising the fact that the protection afforded by the Federal Administration to the government of the present State Executive, is the cause of bitter personal and political feeling in the breasts of nineteen-twentieths of the white inhabitants of the State."

---

This report was forwarded to General Sherman, and by him to Washington, with the following endorsement:

"This paper is most respectfully forwarded to the Secretary of War, with a request that he submit it for the personal perusal of the President. I know of no officer of Colonel Morrow's rank who is better qualified to speak and write of matters like this, and his opinions are entitled to great consideration. I profess to have some knowledge of the people of that section, both white and black, from a long residence among them before the war and several visits since, but I shall not intrude my opinion in the confusion in which the subject is now enveloped."

On this same day General Sheridan assumed command at New Orleans; that is to say, he was sent there with general liberty to do what he chose at the very time that the Government, through the General of the Department, was investigating the disorders. So hurriedly and unexpectedly was this done that the act amounts to a direct insult to Sherman, but we can understand the whole thing when we reflect that, unless the Legislature had been dispersed on the day it was, there would be now a peacefully organized government in the State—but it would not have been Kellogg's.

---

Irwin has at last testified as to what he did with the Pacific Mail money entrusted to his care for the purpose of corrupting Congress, and it turns out that he has paid most of it in large sums to Schumacker, King, and a man named Whiting, without instructions as to what they were to do with it or whom they were to corrupt with it, or calling upon them for any account. In fact, he gave them *carte blanche* to corrupt anybody they could, relying on their reputation as skilled workmen. Schumacker, who seems to be one of the most unblushing corruptionists in public life, received $300,000 instead of $275,000, the sum which was traced into his hands, and positively declines to tell anybody what he did with the money. King has disappeared, and Whiting not been heard from. The investigation has resulted thus far in disclosing in great detail the nature of the operations usually carried on by the lobby, and, looked at from that point of view, it is instructive. Besides the disclosures of Irwin, the principal event of the week has been a statement made at the bar of the House by another recusant witness, Wetmore, a newspaper correspondent who had managed to make himself into a martyr by refusing to tell the name of a certain imaginary person referred to by him as the author of some scandalous tales about the corruption of Mr. Beck, of Kentucky, which he was busily engaged in disseminating by means of his newspaper. This witness, on being brought before the House, made a speech in which he admitted that he could not now give the name of the author of the story, but intimated that he thought he might be able to do so with the assistance of Mr. Beck, and expressed the hope that the latter would help, "so that he [Beck] and all honest men might be found innocent in the maelstrom of overwhelming charges; so that the goats might be selected from the sheep, and so that the sheep might be selected from among themselves by the Darwinian process of investigation—then they would all grow purer and purer until they became angels of virtue." On this Mr. Wetmore was sent to jail again for contempt, and it is said that there was a pretty general feeling in the House that he was insane—a conclusion reached chiefly through reflection upon the peroration we have just quoted. This is a cheering indication of the intellectual progress of the members, for most people who have, for their sins, to read the proceedings of Congress would probably find it difficult to distinguish between the rhetoric of Mr. Wetmore and that which adorns the orations of many a senator and representative.

---

The failure of Mr. Henry Clews, lately one of the brokers of the United States Government in London, throws some melancholy light on the management of the Treasury in the days of Messrs. Boutwell and Richardson. The Government funds had been in the hands of the Barings from the foundation of the Government, and a house of the standing of the Barings was undoubtedly the proper custodian of them, even if they had no traditional claim to confidence. But, on pretence of wishing to put them in the hands of a thoroughly "American" firm, they were handed over to a new firm, composed of Mr. Clews, an Englishman, who was just becoming known as a dealer in money in this city, and had a very moderate capital, and Mr. Habicht, a Swede, who had never dealt in money and had no capital at all. The real explanation was that Mr. Clews was an active politician of the Custom-house school, who contributed largely to campaign funds and figured very prominently in the newspapers. The new house had been taking care of the Government money for about a year when the panic came, and then it went to pieces, and after a feeble attempt to rally has gone into bankruptcy, and the published schedule of its assets has astonished a generation which has had considerable experience of worthless stocks and bonds and unpaid

coupons. It is thought the estate will pay from ten to twenty cents on the dollar. How much the Government loses we do not exactly know. Taking the affair in connection with the Treasury relations to Jay Cooke & Co., it must be pronounced a bad attempt to use one of the most sacred public trusts—the care of money—to reward party "workers" of a low order.

---

The war between the German Government and the Church rages with undiminished fury, but there is not the smallest sign of practical popular adhesion to the cause of the clergy. There are plenty of addresses of sympathy to the "persecuted" priests and bishops, but not the least tendency to aid them in any more substantial way. The middle-class Liberals cheer Bismarck on; the peasantry look on passively; and the state officials, Catholic as well as Protestant, execute the law with remorseless vigor. The Bishop of Paderborn, who was the only German bishop who supported the dogma of infallibility at the Council, has now at last been deposed from his office, as far as the temporal power can do it, and will probably be expelled from the kingdom. The sentence found him in prison, where he was expiating several other offences, such as refusal to allow his clerical schools to be visited by Government inspectors, and appointing parish priests without the approval of the authorities, and publishing vituperative pastorals against the Government, and excommunicating priests for obeying the law. To what lengths of absurdity the Papal party in Germany are ready to go, and how richly they need the discipline they are receiving, may be conjectured from the fact that one of their leading organs, the *Schlesische Volks-Zeitung*, declares that "the Pope has the right to depose sovereigns even now, and is likely to exercise this right in future," and then goes on to explain in what contingencies. The present German sovereign, having been "baptized in the name of God," he is not likely to interfere with, but if any one of them was to become a Turk, or a Unitarian, or licentious like the Elector of Hesse or like Queen Elizabeth, "the great female assassin," there would be "no reason why the Pope should not use his power, and send such princes to the right-about. . . . If a Pope finds that a dynastic firm has become bankrupt and lost the favor of heaven, he is perfectly justified in sequestrating the business, and forbidding all whom it may concern to have any further dealings with the insolvent potentate." It must be admitted that Christians like these will be none the worse of an occasional visit from the police.

---

Bismarck has made a fresh contribution to the controversy by publishing a confidential circular-despatch which he sent to the German diplomatic agents in May, 1872, touching the next Papal election. It is to this event that the minds of the combatants are really now secretly turned, because there is a general expectation that it will bring about a total change in the relations of the Papacy both to Italy and other Continental powers. The despatch calls attention to the fact that even under the old régime, when the bishops were independent, the Great Powers really interfered in the election, and the Roman Emperor and Kings of France and Spain had the right of ruling out candidates who were specially obnoxious. Now that the bishops have been converted into the mere tools or agents of the Pope, this interference is doubly necessary. "For these reasons," he says, "those governments concerned in the election of a Pope, for the ecclesiastical interests of their Catholic subjects, and the position of the Catholic Church in their countries, should approach the question in time, and if possible agree upon a common attitude and the conditions on which they will recognize the next Pope. Could an agreement upon this head be effected between the European governments, this would be of immense importance, and perhaps might obviate serious complications." In England, the Bishop of Salford has directed his priests to refuse the sacraments to Mr. Petre, a distinguished Catholic gentleman, on account of a letter written by him in the *Times* repudiating the dogma of infallibility, and Dr. Newman has written a pamphlet on the relations of his Church to the state which shows plainly that he does not accept the dogma in the sense in which its more ardent advocates affirm it, and that he disapproves of the Pope's surroundings and of the influences under which the old man acts.

---

The result of Marshal MacMahon's Message to the Assembly of the 6th inst., of which we spoke a fortnight ago, urging the passage of a constitutional bill providing for the transmission of his own powers in case of his death, is that the demands of the *ad interim* ministry for the discussion of the bills on Friday last was met by a vote setting them down for Thursday last; and on that day the bill known as M. Ventavon's, creating a Second Chamber and making the ministry responsible to the Assembly, giving the President the power of dissolution, and providing that at the close of his term the two Chambers then sitting should in joint Convention decide definitively on the form of the government, was brought up. On Friday, after a sharp debate, the Right apparently fighting hard, the bill was read a second time by 557 to 146—or, in other words, passed. On Monday, the bill creating the Senate also was read a first time by 512 to 188. All this differs from the programme originally proposed, and in which the ministry was defeated, simply or mainly in the fact that the Government desired to have a Second Chamber created in advance of everything else. The main objection of the Left to the present bills is that they contain no formal recognition of the Republic, and the Legitimists are opposed to them for the reason that though they leave the form of the government still an open question, they provide a tribunal to settle it. The majority is mainly the result of a series of conferences between the Marshal and the members of the Assembly of all parties, in which he showed that he was willing to accept support from any quarter in putting an end in some degree at least to the provisional state of things. He has thus probably got as much certainty about the future as can possibly be extracted from the present Assembly. The next step must be dissolution.

---

The details of the last revolution in Spain have come out by mail, and they present a somewhat ludicrous picture of the conversion of a republic into a monarchy. Indeed, there is something farcical in all Spanish revolutions, because the revolutionists on neither side seem to care much about the matter, and change their government apparently much like boys, who pass in weariness from one game to another. When the first news of what was impending reached the ministry in Madrid, they telegraphed to Serrano to come back, but he, like a wag that he is, replied that he was first going to fight a desperate battle with the Carlists, and couldn't. Of course, he had not the smallest intention of fighting. When all was over, he went over the frontier into France, not because he was displeased at what had occurred, but because, as he says, his presence at Madrid might just at this moment embarrass the new government. The ministry, as a last resource, issued a vigorous denunciation of the Alfonsists in the *Gazette*, and then abandoned their posts. What precipitated their abdication was, not a canvass of the people, but an examination of the state of feeling in the various barracks of Madrid. It was found on enquiry that the troops had no intention of doing any fighting on this particular occasion, on learning which the ministers resigned, or rather disappeared from the public gaze. In fact, the public seems to have had nothing to do with this revolution whatever. The Madrid people seem pleased with the decision of the army, and even the Red and turbulent Barcelona takes it quietly. Campos, the general who got it up, appears to be a thorough adventurer, always on the lookout for some happy stroke, who was living under a cloud in Madrid when he planned the restoration, and he did not hesitate to begin the great work with two battalions, before whom he waved his hat and hurrahed for Alfonso. Probably the feeling of all the other generals now is—what a lucky dog he was to have thought of this first. The Spanish funds have risen under the change to about fourteen cents on the dollar, congratulations are pouring in on the Prince from the other crowned heads, and there is talk of peace with the Carlists.

## THE SENATORIAL ELECTIONS.

THE chief thing which the people of this country have been for some time asking of the two political parties which control its various governmental affairs, is that official power be confided only to men of fair intelligence and unquestionable integrity. The request is reasonable—so reasonable that an inhabitant of any other civilized country might suppose it to be needless. Yet there is no other request of the people which has been so flagrantly and defiantly refused; and the refusal extends through our executive departments, post-offices, and custom-houses, through our city and county offices, through our State and National legislatures, until at last it reaches as high as the Senate of the United States. Our senators are singularly limited in number; they are peculiarly chosen by a supposed double process of selection; they combine functions which are legislative in making our laws, with functions which are executive in restraining the President; and their term of office is longer than that of any other of our elective officers, exceeding even that of the President himself. Under such conditions, it would seem as if an office of such responsibility must be always carefully guarded and honorably filled.

The extreme lowness into which our political matters have sunk at the present time cannot be more clearly stated than by saying that, to-day, the highest principle which can actuate the conscientious citizen leads him to cast his vote almost exclusively with reference to the selection of men. In other words, our political management has gone down so far that the thoughtful and conscientious perceive it to be a vital matter of principle merely to get upright and competent men into office. The maxim of voting for principles, not men, still holds its place, but the cardinal principle for which all others must be postponed consists in getting honor and integrity and intelligence to accept the trust of government. The last election unmistakably demonstrated that a considerable portion of our people have gradually adopted these views, and that they are resolved that the public safety at last requires that this country shall be governed not by Democrats so much as by better men. No Republican stayed at home or went over to the other side because of confidence in previous Democratic management. The change was made to check existing maladministration, to restore a wholesome doctrine of party accountability, and to bring into public life the best class of candidates that we possess. If forty such men as Messrs. Foster and Potter and Phelps, taken equally from the two parties, could be sent to-morrow to the United States Senate, the better half of the American people would give a sigh of relief, and devoutly thank heaven for the mercy, without casting one regretful thought at the subject of political gains or losses.

The United States Senate, considered as a political field, has two peculiar attributes. First, it is the field from which party management can most easily keep out bad material—for but a single senator is chosen at a time; he represents an entire State; the machinery for choosing him is that which party management most completely controls; and the position is still accounted one of great honor, being in popular estimation only below the offices of President and Vice-President. Secondly, the Senate is the political field in which bad material lasts the longest, and in which good material can effect the greatest good; for it is invested with the double power of correcting the eccentricities of the Executive and of curbing the stampedes of the House. If only the Senate were made up of high-minded, courageous, and intelligent men really devoted to the work of good government, we might lay aside solicitude, and feel assured that though our government might not go forward very fast, yet still that it would not go very far astray. Conversely, let any one conceive of our foreign relations being controlled by such men as Butler and Chandler, and Logan and Pinchback; some of whom would think it a fine piece of patriotic bluster to break off friendly relations with a foreign power, while the others would deem it a "smart" thing to step into Wall Street betimes and make fortunes out of the fall of stocks. If the capabilities of the Senate for conservative action or profitable mischief were fully appreciated, it would be the chief subject of contest between anxious citizens on the one side, and unscrupulous managers on the other; and it is not unlikely that the future rise or fall of our Government will hinge upon its improvement or decline.

Into this Government of ours there has been slowly eating its way a disease or dry-rot, consisting of a low standard of character, which believes in avoiding indictable offences, and the taking of specific bribes for specific acts, and such crimes as theft and perjury; but which allows men in public office to make money from their offices by indirect methods so long as they are not guilty of direct embezzlement, and to equivocate provided they avoid a downright lie, and to wink at the crimes of their political associates upon condition that they keep the stolen money out of their own pockets. In studying this disease, let us consider in connection with our highest legislative body such cases as Mr. Harlan becoming the voluntary tool of a few unscrupulous, unprincipled stock-jobbers; Mr. Cole, through the influence of $100,000 paid to his brother-in-law, becoming the chief manager of the opposing set, the same senator suspiciously smuggling the Sanborn amendment through the Senate without debate (conduct which has increased significance since the Pacific Mail exposure); Mr. Conkling listening, to say the least, in the New York Custom-house while his appointees were planning the plunder of New York merchants; Mr. Carpenter, unrebuked, deriding every one who tried to prevent the back-salary embezzlement, or elevate the degraded civil service of the Government; Mr. Stewart colluding with the American Minister to defraud unsuspecting foreigners who foolishly believed that the honor of American dignitaries was of as high a caste as their own; and finally, though the list of cases might be indefinitely prolonged, men of as good previous reputation as Mr. Patterson and Mr. Dawes allowing a shrewd man like Oakes Ames to entangle them in his toils. From the examination of such cases every reflecting person must turn away with the conviction that the standard of character in a public body where such things can exist must be low. It is not to be inferred that every man there is necessarily bad. We all know that Oakes Ames never had his hand on Mr. Sumner. We also know that for him to have put his money in Mr. Sumner's pocket would have been to put it where it would do the most harm. And we take these to be the three types of men that make up such a body as the present Senate of the United States—the bad, the weak, and the morally courageous. For some time past the selection of senators by party managers has resulted necessarily in sending up a large proportion of the weak element; for party managers cautiously recede from putting the downright bad in too responsible stations, and cannot from the nature of things make terms with the morally robust. Fortunately for the country, however, it begins to be perceived that, apart from ignorance and incapacity, there are two dangerous classes of politicians in public life—the bad and the weak—and that these in all moments of difficulty are practically united. It may be said that the former are few, but what matters that if at critical times they are sure to be reinforced from the full ranks of the latter? The constant recurrence of combinations between the bad elements and the weak elements of public management is the alarming fact which rouses people to demand the selection of better men.

To cut out this disease, it is by no means necessary that we have demigods in Congress, nor even great men like Clay and Calhoun. It will be amply effective to fill Congress with such members as Mr. Willard of Vermont or Mr. Foster of Ohio, and to keep them there. Mr. Willard, for some outspoken words against the President, it will be recollected, was promptly "beaten in convention" by the party management in Vermont; but Mr. Foster will have the opportunity of laying the country under renewed obligations. Now, what are the chief obligations which Mr. Foster has laid upon us? for he is not a striking orator like General Logan, nor a dispenser of offices like Mr. Conkling, nor a leader of the party like General Butler, nor even the Father of the House like Mr. Dawes. When Mr. Foster, in company with Mr. Beck, stumbled upon the Sanborn

contracts, he walked courageously forward with his rough-spoken political opponent, and in a quiet, unpretentious way did in Congress the honest work of an honest man unflinchingly against his party. In this recent New Orleans business he has again elected to walk in the same straightforward course, and has preferred to throw the moral weight of a unanimous report in support of an unfortunate community to bolstering up his party by raising a quantity of false issues and bringing in irrelevant matters. The severity with which he has been treated by his political associates in Congress and the abuse and ridicule thrown at him by some of the newspaper organs for not "standing by his party," show pretty conclusively that if it were before election instead of after, the party management would endeavor to get rid of Mr. Foster as effectually as it got rid of Mr. Willard. Certainly, every State has men enough of this stamp to change the character of Congress and effect all needed reforms, if party management would permit them to undertake the work.

Such being the necessities and possibilities of the case, what grounds of public confidence have been laid by party management since November in the senatorial elections? On the Republican side, party management has struggled to retain the very worst men in the Senate, and has in no instance attempted to effect a change for the better, and has, in every instance where two Republicans were in the field, selected him who possessed the least of public confidence. On the Democratic side, the good and bad elements are mixed; there is a great falling short of good professions, but there is not the invariable defiance of public opinion which characterizes the Republicans. In Indiana, Mr Voorhees has certainly been set aside. In Ohio and Delaware, the two ablest Democratic senators have been re-elected. In New York, we see the benefit of having party management in respectable hands, for, while there has been a strict party choice, the choice has fallen upon a gentleman of excellent character and unquestionable ability. In New Jersey, the selection is probably the best that the party could have made. But on the other hand, it is unfortunately equally true that in the two States which have been most anxiously watched, Missouri and Pennsylvania, Democratic management has rejected the man who of all in the country ought to have been elected, and has chosen the politician who of all in the State ought to have been rejected. To one Democratic caucus, however, the country ought to be thoroughly grateful, for it allowed its members to be led by their common-sense, and they were rewarded with the success which generally attends common-sense. In Michigan, they have struck down one of that class who combine ignorance, audacity, bad habits, official patronage, and unscrupulous wealth, and have secured for the Senate one of that class through whom, if the American Government is to be saved, its elevation will be accomplished. No party management can do more than this, and when such management becomes the rule, this country, though it may have much to be divided upon, will have very little to regret.

## THE FARMERS AND THE SUPREME COURT.

WITHIN the last few weeks the newspapers have been full of despatches and predictions from Wisconsin to the effect that the present session of the legislature of that State will repeal or substantially modify the Potter Railroad Law. We have ourselves very good reason to believe that these anticipations are well grounded, inasmuch as we understand that a loan needed in Wisconsin for public improvements has been refused by English capitalists solely because of the existence of the Potter Law, and that the only hope of effecting it now lies in an alteration of the law. It seems to be generally believed, too, that if this particular measure is struck off the rolls the trouble will be over, that the capitalists will be satisfied and happy, and money will flow freely as of old from the plethoric coffers of London, Boston, and New York into the Northwest. So far as the repeal or modification of the Potter Law goes, every one must be rejoiced to hear of this proof of returning wisdom, and our readers will bear us witness that we have never expressed a belief in the permanence of this notorious piece of legislation. But we expect and demand a great deal more than this, and every one, either in Europe or America, who is interested in the stock or bonds of any Western railroad, will recognize the justice of the demand. What is needed now, in the interest of every one who either has property or the hope of acquiring property, is an authoritative exposition by the highest and final tribunal of the country of the rights of people who invest their earnings in the securities of railroads, on the faith of charters granted them by States or the United States. The withdrawal of the suits now pending in the Supreme Court at Washington, in consideration of the repeal or modification of the Potter Law, would really leave the matter exactly where it now is—would give the bond and share holders no more guarantees than they have now, would abridge no right now alleged to exist on the part of the State, and would leave the whole matter to be reopened as soon as the next era of railroad speculation and extravagant town-bonding should give the farmers reason to believe that they were not making money fast enough.

Let no one suppose for a moment that this is a forced statement of the motives which have guided the Grangers in their assault upon railroad property. They maintain, indeed, that they have a legal theory of the relation of corporations and the state at the bottom of their demands, but this is a sheer fabrication. Their theory now is that railroads are public highways, and therefore the tolls taken on them must be such as the public deems reasonable. It is not more than half-a-dozen years, however, since throughout the West there was a great farmers' movement directed to the sole end of getting the courts to declare the direct opposite of this—that a railroad was a purely private enterprise, and had no public character whatever. The explanation of this inconsistency is simple enough. It is that in the first instance the farmers wanted the courts to declare that bonds, issued by themselves in their corporate capacity of towns and counties in aid of railroads, were illegal, and on that account they need not pay the interest. To do this it was necessary that the roads should be decided to be private companies, in aid of which of course public taxation or loans were unlawful. Now, however, what the Grangers want is to make the roads carry grain at such prices as will make farming remunerative when it does not pay to farm, and therefore they have gone into court to procure decisions to the effect that railroads are public highways. This is not a mere technical inconsistency which it is for lawyers to explain and dissipate; it is in reality a glaring and insolent assertion on the part of the Grangers that they do not care what the law is, or what justice is, but that they propose to frame, whenever they either wish to stop payments of their own debts to railroads, or wring some money out of the railroads, some legal theory to fit the occasion.

We maintain, as we have maintained all along, that the principle of the Potter Law (which is, of course, in no way abrogated by change or repeal of particular measures devised to give expression to it) is either confiscation, or, if another phrase be more agreeable, the change of railroads from pieces of private property, owned and managed for the benefit of those who have invested their money in them, into eleemosynary or charitable corporations, managed not for the profit of the owners, but for the benefit of a particular class of applicants for outdoor relief—the farmers; and, more than this, such farmers only as happen to live along the line. There is no reason, either, why this new principle should be applied only to railroads. If true of them, it is equally true of all corporations incorporated by private capital for ends of anything like a public character—such as newspapers, hotels, telegraph companies, and all factories for the manufacture of necessary articles, particularly those dedicated by law to public uses by protection against foreign competition. That this is the principle which the Grangers wish to have embedded in the structure of the law of the country, we deduce from several considerations: first, from the inevitable nature of the legal arguments used; second, from the inevitable analogy between the property attacked and those other kinds we have just enumerated; third, from the temper and general tone of the arguments by which the Grangers support their claim; and, fourth, by the

only example of what they demand and are satisfied with in the way of judicial support—the opinion of the Supreme Court of Wisconsin on the constitutionality of the Potter Law—an opinion vastly more important and dangerous than the law itself, since the law might be considered the effect of a mere gust of passion, while the opinion was put forth as a calm and dispassionate statement of legal duties and liabilities.

With regard to the use of the word "confiscation," which many people seem to think so unnecessarily harsh and unjust, we must say that the common notion that people who make an attack on other people's property begin their movement by crying "Go to, let us rob, and plunder, and destroy," is incorrect. Almost all schemes of spoliation in modern times make a pretence to morality of some kind, as we may see now in the South, where property is taxed into the pockets of men like Casey, Kellogg, and Moses in order that "the negro may be protected," or in the Paris Commune, where a great deal of the most valuable property was destroyed, and all private owners threatened with confiscation, and general anarchy introduced, in order to bring in an era of liberty, fraternity, and equality. So, too, the repudiation of the five-twenty bonds is demanded by large bodies of people on the ground that speculators have made too much money out of their issue, or because justice requires that we should abide by the "letter of the law." Therefore, in saying that the decision of the Wisconsin Supreme Court is a decision in favor of confiscation, we do not mean that Chief-Justice Ryan and his associates are in the habit, when not holding court, of robbing on the highway, or even mean to encourage robbery, but to call the attention of investors and property-owners to the fact that the highest court of that State has solemnly decided, on the demand of the State Attorney-General, that the right to confiscate for the benefit of a class is part of the fundamental law of the country. A railroad charter, they say, is certainly a contract, but the State of Wisconsin has reserved the right to alter it at pleasure, and of the expediency and justice of the alteration they are sole judges. Railroads may, it is true, issue bonds guaranteed by all their property and vested rights, but the purchasers of these bonds take them at their peril, and subject to the right of the legislature to deprive them of all their value. To say that the legislature would be incapable of such folly is no answer; because, if we may judge by experience, there is no folly of which legislatures are incapable.

In saying that such legislation as the Potter law converts a private company into a charitable society for the benefit of a particular class, we are really understating the case. A charity is as a general thing supported by funds raised by taxation, and thus contributed by the whole community, or it is supported by private funds voluntarily given by the founder or the associates. But railroads, if their earnings are to be determined by the legislature, are made into involuntary charities. They become charities which are supported by forced contributions levied upon the owners of the stock and bonds. A railroad becomes a sort of God's highway, on which everybody has a natural as well as constitutional right to travel and to transport goods, at the expense of the kind-hearted people who built it. This is charity with a vengeance. It is, indeed, exactly the way in which an invading army uses railroads in time of war.

Such being the legal foundation on which the movement rests, what is the temper in which it is advocated? Is their demand a calm and manly appeal to the public for the redress of proved grievances, or is it a petulant, noisy, and confused clamor for no one knows exactly what? We have before us a number of the *Journal of Social Science*, published six months ago, containing what purports to be a temperate statement of the farmer's grievances by Mr. Willard C. Flagg, president of the Illinois State Farmers' Association. We have looked through it in vain for any discussion of the cost of transportation—a question which of course is the hinge on which any reform must turn; but what we do find, on the first page, is a sort of historical parallel between the post-mediæval peasantry of France and the agricultural capitalists of the grain-producing States of the Northwest:

"One sees," says Mr. Flagg, quoting La Bruyère, "certain wild animals, both male and female, scattered about the country, livid, and roasted by the sun, bent over the soil, which they scratch and dig up with invincible persistence; and when they stand upright they display a human face, for in truth they are men and women. At night they retire to their dens, where they feed on black bread, water, and roots. They spare other people the trouble of digging and sowing and reaping; they deserve not to be deprived of the bread they have produced." "So," continues Mr. Flagg, "allowing for differences in civilization, it has been in all ages. The robber baron, the mediæval merchant, the despotic tax-gatherer, reappear in merchant princes, 'protected' manufacturers, 'national' bankers, and railway 'magnates.'"

And this is what is considered a temperate and scientific way of approaching the subject. Turning to the proceedings of the Illinois State Farmers' Association itself, held six months before this (a report which persons are reminded in the introductory remarks is an "*educational* document"), we find in turning over the first few pages, among other educational material, a resolution introduced for the reconstruction of the courts on "principles of common sense"—the only principle mentioned being that people ought to argue their own cases as far as possible without aid from lawyers or any resort to appeals; second, a resolution to the effect that property "should bring a reasonable per cent. of profit," and that "the owner has the right to fix such reasonable per cent."; third, a resolution that the existing doctrine of "vested rights" of railroads "belongs to a past age," and "has no legitimate place in the jurisprudence of a free people"; besides any number of denunciations of specie payments, and among these a long paper by Mr. H. H. Day, of New York, in the course of which he refers to Mr. John Sherman, chairman of the Senate Finance Committee, as one of a gang of "banditti," and declares that "the first act signed by Ulysses S. Grant swept a thousand millions into the pocket of the specie-basis usurers, and added just so much to the shoulders of the toiling people, and laid the foundation for national decay." In short, we find in these temperate sociological and educational tracts the same sort of violent and irrational language with which the public is more familiar in such reports as that of Mr. Osborn, the Wisconsin Commissioner, who talks of the owners and managers of railroad securities as "these buccaneers of the nineteenth century."

We feel it to be our duty to warn all investors that they will be very foolish to trust any of their money to legislatures which pass such laws as the Potter Act, to judges who decide such laws constitutional, or to communities which produce such contributions to social science and popular education as those from which we have quoted, without the guarantee which an authoritative decision of the United States Supreme Court alone can give. We want to know, and to know finally when we buy one, what a railroad bond or share of stock actually is. Is it, as we are accustomed to consider, property, just as much as houses and furniture, or is it, as Chief-Justice Ryan assures us, a contract between two persons having a value to be determined at the pleasure of a third, to be increased or enhanced as the changing majority of an agricultural legislature happens to view with favor or dislike the railroad system of the country? It is one of the marks of a civilized, as distinguished from a barbarous state of society, that in the former what we call property is protected equally, whether it consists of lands and houses, or of mere evidences of value—paper credits, or bonded debt. If in the era of progress to which the farmers' movement proposes to introduce us, we are going back to a condition of society in which the only sort of property which we can call our own is that which we can make our own by physical possession, it is certainly important to every one to know it, and the only body which can really tell us is the Supreme Court at Washington.

## THE VIRGINIA SCHOOLS.

DR. RUFFNER, the Superintendent of Public Instruction in Virginia, has forwarded us the correspondence arising out of Miss Putnam's charges against the administration of the school system in that State. It will be remembered that this lady asserted in a private letter (published in

the *Nation* of November 12), that at Heathsville, the county-seat of Northumberland County, although the number of colored and white children was the same, of five hundred dollars of the public money appropriated for educational purposes, only fifty dollars was allotted to the colored children; and that in the town of Wicomico Church, in the same county, "while hundreds of dollars," for which the colored people were taxed, were used to maintain the white schools, there was no colored school at all down to the date of her letter—July 26, 1874—or "the last account she had." It is impossible for us to print the letters, owing to want of space. We must content ourselves with a summary of their contents.

Dr. Ruffner, in the first place, sent General Lewis, the County Superintendent of Schools, the extract from Miss Putnam's letter published in the *Nation*, and directed him to give Miss Putnam notice, and to investigate the matter thoroughly, warning her that if dissatisfied with the result she might appeal to Dr. Ruffner himself. The hearing came off in due course, and General Lewis reported that Miss Putnam appeared, but had no proof to offer of the charge about the school funds in the Heathsville District, and referred to a Mr. Nash in Washington as her authority; that, as regarded the schools in Wicomico, she did not know whether there were any there then or not, but at the period to which she now specifically assigned her charge—the term of office of Mr. Cralle, General Lewis's predecessor—there were no schools, but two had been established two years ago, though under the school law the system was not expected to be in full operation before 1876; that at the hearing there was much recrimination between the school trustees and Miss Putnam about extraneous matters, showing that she and those gentlemen were not on good terms. There was then an adjournment of two weeks to enable Miss Putnam to produce proof if she could.

At the expiration of that period she again appeared, but declined to be put on oath, and all she was able to produce by way of proof was a letter from Mr. Nash in Washington, who referred her to a negro named Nickens, in whose house the teacher of the colored schools had lived, but who did not seem to be forthcoming. The school trustees of the Lottsburgh School District, and also those of the Wicomico District, were then sworn, and the affidavits of the former say that Miss Putnam refused to be put on oath and failed to bring forward any proof of her charges; those of the latter, that during the years 1870–71 the colored children of Wicomico had the benefit of the schools of the adjoining townships of Lancaster and Heathsville, and that schools were not established in Wicomico until 1872, because no house could be found for the purpose; but that since that year two colored schools had been "in vigorous operation."

Miss Putnam writes to Dr. Ruffner corroborating the above as to the evidence at her command, and asking for an inspection of the county treasury-books, to see what came of the school money; rejoicing to hear that there are now two colored schools in Wicomico County, and deploring the fact that there were none sooner; and charging the school trustees with "using their influence, position, and money apparently with the main purpose of destroying" her school, and also charging a negro preacher named Pyramus Nutt—whom she styles a "treacherous minister"—with having seized the school-house erected for colored children by the Freedmen's Bureau, and, by force of arms, with the aid of his deacons and church-members, converted it into a Baptist church, in defiance of the protests of a good negro named Nelson Digges. In fact, her letter is mainly filled with wholly irrelevant matter, and shows simply that she and the town school trustees and some of the colored people in the neighborhood do not get on very well together. The correspondence closes with a letter from Dr. Ruffner, pointing out to Miss Putnam that her charges were based on imperfect information, both as to law and facts. The capitation tax of one dollar, which is all that the negroes, with very few exceptions, pay, goes into the State treasury along with the proceeds of all other taxation; and of this the amount distributed among the counties is about $450,000, of which about $162,000 is from the capitation tax on white and black—the blacks paying about $60,000 in the whole State. Add the local school taxes to the State taxes, and there is a total of about $1,000,000 devoted to educational purposes, of which the blacks pay only one-sixteenth; and yet they already receive one-third of the benefits, as there are 52,086 colored children enrolled in the schools, against 121,789 white. The colored population of the State in 1870 was two-fifths of the white; it is now less. In fact, as well as we can judge, the school system of Virginia seems to be coming into operation fairly and impartially, as rapidly as we can expect, and even more rapidly than the law requires. We may add that we think that a little of the old American presumption, on the part of the North, that people mean well, would do much to help the matter on.

## PROFESSOR KELLER ON THE PROBABLE SITE OF TROY.

NOT long ago, in speaking of Horace, we had occasion to mention Professor Keller of Freiburg and his services in Horatian criticism. Last spring Professor Keller visited Greece, Italy, and Asia Minor. The object of his journey was purely *cognoscendae antiquitatis*—to look over the classical ground in general for himself, and particularly to satisfy himself about Troy. A part of what he saw he has written to an American correspondent, who kindly allows us, with Professor Keller's sanction, to make some extracts from his letter for the *Nation*.

Fresh complications in the Homeric and Trojan questions have arisen from Schliemann's discoveries. Perhaps the smoke and dust of another ten years' war must drift away before we can make out all the points clearly, and say with the confident precision of the old campaigner:

> "Hac ibat Simois, hac est Sigeïa tellus,
> Hic steterat Priami regia celsa senis:
> Illic Aeacides, illic tendebat Ulixes:
> Hic alacer missos terruit Hector equos.

Meanwhile, we are very glad to present the views of so distinguished a scholar as Professor Keller on two important points: the archæological value of Schliemann's collection, and the probable site of Troy; particularly as so much has been said and written on the other side.

Of the collection Professor Keller writes thus:

"At Athens I was most cordially received by Schliemann, and had every opportunity to study up his treasures at my leisure. I was struck at once with two things: first with the marked contrast between Schliemann's collection and the familiar creations of Hellenic art, and secondly with its strong resemblance to the objects found in the oldest sepulchral mounds, caves, and pile buildings of Europe and Asia. I could not resist the conviction that Schliemann had struck a remarkable vein of prehellenic or nonhellenic civilization. Then, again, his 'Treasure of Priam,' with its golden vessels and ornaments, was not in keeping with that development of art which we find in the Homeric shield of Achilles, but harmonized admirably with that prehellenic civilization which might naturally be looked for among the vanquished Trojans. The owl-faced vases bear a close resemblance to the vases found in such quantities in those parts of Europe that were formerly Slavic—notably in Silesia and Pomerellen. The golden ornaments are suggestive in their richness of the neighboring Lydia and the golden Pactolus; in their form, of the golden pendants worn by the priests of Asia Minor. The idols are like those of Cyprus and the other islands along the coast of Asia Minor. And, last of all, the written characters on some of the shards bear the closest resemblance to the 'Cyprian character'—a character probably used in other islands besides Cyprus, and even in Asia Minor, before the introduction of the Phœnician alphabet. In short, everything points back to a time of hoary eld, to a primitive, genuine old Asiatic civilization. In sharp contrast with this is the upper and later layer of the Greek type, of which I will say nothing now."

So much for Athens and what Professor Keller saw in Schliemann's own house. Some weeks later, after tarrying at Magnesia, Sardis, Ephesus, and Tralles in Phrygia, Professor Keller found himself on the Plain of Troy. Of this he writes:

"Here I was firmly convinced that Schliemann had dug in the right spot, and not, as most modern scholars maintain, in the wrong spot; and my conviction has been confirmed in the fullest degree on a renewed and careful examination of all the passages in the ancients bearing on the subject. Schliemann's excavations were made, as everybody knows, at Hissarlik. His opponents maintain that Troy lay some hours' journey farther to the south, more inland, in the upper valley of the Scamander, on and by the side of a mountain called Balidagh, near the village of Bunarbashi. This view, which puts Troy in all modern maps at Bunarbashi, is *entirely untenable*. Both Schliemann and Hahn, the Austrian consul, have dug repeatedly, and for weeks at a time, about Bunarbashi, but without finding anything to confirm the hypothesis. Hahn was so firmly wedded to his Bunarbashi-Troy theory that he finally denied the existence of Troy altogether; and about all that he succeeded in grubbing up at Bunarbashi was one (1) insignificant terra-cotta figure, four (4) pieces of earthen pipe, and one (1) earthen watercrock. What a contrast to the thousands of interesting prehellenic antiquities from Hissarlik! And to dig deeper at Bunarbashi would be of no avail, for the natural, virgin soil is reached everywhere at the depth of a foot or two. The crags back of Bunarbashi were occupied only by a transient, *very unimportant settlement*. But Hissarlik, with her layer of deposit and ashes fifty feet deep, with her colossal wealth of venerable antiquities—Hissarlik is none other than the capital of

Priam's kingdom, none other than the seat of Ilion, the rich, the puissant, the proud.

"Furthermore, the united tradition of antiquity is decidedly in favor of Hissarlik, decidedly against Bunarbashi. The Homeric poems of which the Iliad is made up are notoriously of various origin. Only one of the twenty-four books, and that a book essentially different from the others, shows a personal familiarity of the author with the Trojan land. This book—the twentieth—says distinctly that sacred Ilios lay not on the spurs of many-fountained Ida, but *in the plain*. Then, again, the mythographer Apollodorus says that Ilios stood on a *hill*. This designation also applies admirably to Hissarlik, but not to Bunarbashi. It was at Hissarlik that Xerxes sacrificed, at Hissarlik the Spartan general Mindarus watched the sea-fight in the Hellespont, and so on. Only three scholars in all antiquity doubted the identity of Hissarlik and Troy; they maintained that Troy lay not at Hissarlik, but at the 'Village of the Ilians'—Ἰλιέων κώμη—probably from sheer envy of the prosperous Hissarlik-Troy, the pet of Alexander and the Romans. Excavations have been made at the 'Village of the Ilians' also, but utterly without success. And then the village lies entirely in a plain, and there is no spot where an acropolis could possibly have stood.

"In view of all these facts you may very naturally ask, 'How did Bunarbashi ever come to be pitched on in modern times as the site of Troy?' The answer is very simple:

"First. The French traveller, Lechevalier, fancied he had found at Bunarbashi the peculiar springs described in the twenty-third book of the Iliad. But the description does not tally very well with the springs found by Lechevalier, and is equally applicable to many other springs in the Troad; and besides, the race described in the twenty-third book would be impossible at Bunarbashi, where a chasm of some four hundred and ninety odd feet in depth would have to be clambered over—a hard road to travel.

"Secondly. It was thought that inferences might be drawn from ancient Greek cities with regard to Troy, not a Greek city; and inasmuch as the far-famed acropolis of Mycenæ was behind a plain, on a high eminence, it was thought that Troy, too, must have had her acropolis in the rear of the plain of Troy, perched on lofty crags. In answer to this we may say, (1) That it is contrary to the traditions of antiquity. (2) That a mass of fragments of antique pottery is to be found at Mycenæ, and none at Bunarbashi.

"The conclusion of the whole matter is this: we have in Schliemann's collection unmistakable relics of Troy, of immense age, and the spot on which he has made his excavations is not simply New Ilion, but the Ilion of all times."

## ENGLAND—THE NEW PARTY LEADERS.

London, January 1, 1875.

FOR the first time for several years we have had old-fashioned Christmas weather. I have just parted with friends who have travelled from the north of Scotland, and they tell me that the whole country, from their home in the far North to London, is covered with one uniform white coating of snow, and that the salt as well as the fresh-water lochs in the Highlands are frozen over—an unwonted phenomenon in this country. Here we have had ice in the parks, and a good deal of what would anywhere else be snow. But nothing white has any chance in this "infectious congregation of vapors." Before the snow-flakes reach the ground, contact with the "blacks" for which London is proverbial reduces them to a sort of Oxford grey, as if they were in half-mourning, and when they have rested but a few minutes on the streets they are transformed into a sooty slush, hideous to such senses as are affected by it. And this unexpected weather seems to have frozen up all intellectual and political as well as most physical life. In literature not much of interest has appeared this autumn except the 'Greville Memoirs,' and people are beginning to regard them as vapid and of little worth. January, however, is usually a stirring time for publishers, and something may appear this month. In politics, we are contentedly at rest. There is not a Parliamentary election nor even a petition going on to break our quiet. But there is some speculation at the clubs and Government offices and in society about the political programme of the future. Parliament has been summoned to meet for despatch of business on Friday, the 5th of February. The Prime Minister is in failing health, and the leader of the Opposition, Mr. Gladstone, is so erratic in his conduct at present that there is some risk of the session commencing without any leader in the House of Commons either on the Ministerial or the Opposition benches. People are asking freely who will lead the Conservatives in Mr. Disraeli's absence, and they find it difficult to get an answer.

There are only three possible leaders; Mr. Cross, the Home Secretary; Mr. Gathorne Hardy, the Secretary for War; and Sir Stafford Northcote, the Chancellor of Exchequer. The first of these may be dismissed in a word. Mr. Cross comes from the same county as Lord Derby, and is regarded as a protégé of his. But he is new to office, and never held Cabinet rank before last year. He did not especially distinguish himself during the past session in the discharge of his duties either in the House or in his department; indeed, he rather made a mess of it. Mr. Gathorne Hardy is a ready "rough-and-tumble" sort of orator, with a clear voice and an aptitude for saying hard, uncomfortable things at his opponents. Last year, for instance, when some inoffensive politician, zealous for his country's good, asked a harmless question about some regimental band, Mr. Hardy, being War Minister, recommended him "to blow his own trumpet, which he was so well qualified to do." For the moment it "brought the gallery down," and the inoffensive politician collapsed. But the House of Commons does not like that sort of thing from a Minister of the Crown. The pervading atmosphere is superior to it. The majority of the members are men accustomed to the tone and spirit of well-bred society, and a coarse snub, such as this of Mr. Hardy's, administered unnecessarily, the House resents and remembers. It does not object to see a troublesome man rebuked by a responsible minister. It rather enjoys it if well done. But it must be done not coarsely but with finish—such finish as Mr. Disraeli, for instance, has always at command. But even if the House could get over Mr. Hardy's want of finish—and the Conservatives would condone a great deal in an emergency—he would find difficulty in securing a trusty following, owing to his ecclesiastical leanings. He alienated the moderate Protestant party last session by his action on the Public Worship Regulation Act. He did not disguise his Ritualistic proclivities, but on more than one occasion voted with the professed supporters of the Ritualistic movement against Mr. Disraeli and other members of the Cabinet. In the present Puritanic or anti-Romish temper of the House and of the country, these votes would be almost sufficient to prevent Mr. Hardy from taking the place of leader if, owing to Mr. Disraeli's absence, the post should be unfortunately vacant. The ministerial party, therefore, would be left in the house to the guidance of Sir Stafford Northcote. You are probably nearly as well qualified to take the measure of his capacity as we are on this side of the Atlantic. As one of the Joint High Commission of 1871, he is not unknown to you. Here he is considered a man of fair capacity and creditable assiduity. He was trained by Mr. Gladstone, and has learned from him some rudimentary lessons in finance. He has the gift of a conciliatory temper, and he is a tolerable matter-of-fact speaker, with a pleasing if not a convincing manner, and his opinions are exactly of that hybrid type between Liberalism and Conservatism which is now prevalent in England. He could never steer the ship in troublous times, but in calm weather, with a disciplined and compact crew, anxious to keep the Tory vessel in, and an undisciplined and divided Opposition not particularly anxious to turn it out, he will do the work quite well. Much would necessarily depend upon the Prime Minister. If Mr. Disraeli remained in office, and was well enough to take part in the great debates from time to time with anything of his old astuteness, Sir Stafford Northcote might represent him in the daily formal work. But if the more unfavorable accounts of Mr. Disraeli's health are true, Sir Stafford Northcote's duties and opportunities for good and evil would be grave. The future Prime Minister would be a member of the House of Lords—the Duke of Richmond in all probability, because rumor (and she is not always false) has it that Lord Derby will not serve under Lord Salisbury, and Lord Salisbury will not be ruled by Lord Derby. The leader, therefore, in the Lower House will hold a most important and most difficult place in British politics. Will Sir Stafford Northcote prove strong enough for the place? That is a question time alone can solve.

But let us turn to the Opposition. Who is to guide the policy of that fortuitous concourse of atoms? Mr. Gladstone, even after all the vagaries of the last twelve months, might still be able to mould them into something like consistency if he could be persuaded to resume his place. He is the only man of genius among them, and, as one of them said the other day, "he is a head and shoulders taller than any man in the House." But that marvellous phenomenon called his "mind" is so absorbed by theological niceties, and his imagination is so impressed by the bugbear of a hostile Irish vote which he has conjured into existence and the importance of which he greatly exaggerates, that it is said to be more than doubtful if he will consent to call his followers together at the commencement of the session. Failing him, to what shepherd can the herds of scattered sheep give ear? Mr. Forster and Mr. Childers have been with you, and we have heard only the echoes of their utterances. Mr. Göschen has made two speeches in the recess, and he would not have damaged his position if he had left them unmade. Mr. Lowe has been discreetly silent. Lord Hartington has uttered

only half-a-dozen platitudes about the advantages of art, though his brother, Lord Frederick Cavendish, has professed himself prepared to consider favorably the question of disestablishment of the Church of England. Poor Mr. Stansfeld has ruined any chance of influence he ever might have had by plunging headlong into a sentimental quagmire of unpleasing questions, which excite a minute section of advanced female politicians and disgust all reasonable men. None but the tainted wethers of the flock will hearken now to him. Mr. Fawcett, indeed, has made a valuable speech to his constituents which advances him a step or two in the political ladder. But his physical infirmity unfits him for leadership—though blindness should be no bar to a place in the Cabinet, and it may be that his courageous independence, single-mindedness, and strong judgment may yet add influence to a Liberal Cabinet—and Mr. Fawcett prefers the place of an enlightened critic to that of an aspiring leader.

I have omitted, as you will observe, to allude to the pretensions of Sir William Harcourt, and the reason is that I am unable (and I cannot find any one to enlighten me) to say which party it may be that his ambition leads him to direct. He has just made a speech of no inconsiderable ability; but who can read the riddle that he there propounds? Does he wish to oust Mr. Gladstone by disparagement, or to succeed Mr. Disraeli by blandishment? English politicians and writers in English newspapers are turning over this curious question in their minds during their wintry Christmas holidays, and it will take a good deal of turning before they find an answer. Sir William Harcourt has long been in quest of Parliamentary distinction. Full twelve years ago he made abortive efforts to secure a seat—on which side of the House I do not recollect. He succeeded as a Liberal in 1868 at Oxford—the constituency which he now represents—and both he and his friends were sanguine of his early success. But at first it grew but slowly, and it was not until the Gladstone Government were in the shade that the member for Oxford began to shine. At this time he sat below the gangway, among the more revolutionary of the young republicans whom the wave of ardent Liberalism carried into the House of Commons at the general election of 1868, and he early proclaimed himself a champion of trades-unionists, farmers, commons-preservers, licensed victuallers, and other oppressed interests. He elicited a compliment from Mr. Disraeli by his eloquent defence of the Irish Education Bill, which shipwrecked Mr. Gladstone's Government, and shortly after was offered by Mr. Gladstone, and accepted, the office of Solicitor-General; and in that capacity, having more leisure than many law officers of the Crown, it is generally admitted that he performed his duties well. But the dissolution came, and Sir W. Harcourt was no longer Solicitor-General. In opposition, men have opportunities of distinguishing themselves which they cannot have in office, and Sir W. Harcourt has used his opportunities to strange advantage. He has spent his time in discrediting the fallen Prime Minister who brought him into office, and in doing homage to the risen Prime Minister who turned him out of office. And by these performances he has made himself one of the most considerable personages in the House of Commons, and a man of no small prominence in the country. He has a commanding presence; he is multifariously if not too deeply learned. He speaks fluently what he himself and his admirers would call speeches; but those who know the thing would call them well-written leading articles. But be they which you will, he interests his audience and the country in them, and he makes them understood. He has good discernment, and makes up his mind in early days which way he thinks the cat will jump, and prepares himself to take advantage of her agility. If he has discerned wisely, and the animal has jumped accordingly, his early decision gives him a start of competitors less prompt to act; and if he was at fault, he has sufficient ingenuity to follow along the other route before she has quite got out of sight. In the old days, when we were disestablishing churches with applause, and settling knotty points of evil precedent in land tenure, Sir W. Harcourt sat among the light-hearted Radicals. It was a radical cat in those days. In 1872 it was a dissipated cat, that would not let them rob the poor man of his beer nor make the country moral by act of Parliament, and then Sir William Harcourt was as rollicking as a licensed victualler. Last session we were putting down the Ritualists, and Sir W. Harcourt was the austerest among austere Protestants. Just at present the cat is jumping pleasantly on a level plain of Liberal-Conservatism, and Sir W. Harcourt is a Whig. He has cut himself adrift from his old shipmates with whom he sat below the gangway, and shows his superiority over them by jeering at the advanced opinions of their friends. It is a dangerous game to play—this game of running with the hare and hunting with the hounds. The old Whigs look askance at their new ally, and ask each other if these performances are quite consistent with their old traditions. The young lions of the *Examiner* and the *Beehive* have thrown him over. They thought they had found an Ishmael who would go out into the wilderness of Opposition and be ready to raise his hand against all privileges and all vested interests. But what is the animal they have cherished in their bosom? Certainly not an Ishmael—not even a hairy Esau. Only a Whig Jacob, looking for a birthright, and wearing Esau's cast-off clothes until they became too large for him and he thought it wise (to quote his own words) "to take in top-hamper." The Tories do not know how to act. They see in Sir W. Harcourt the sort of politician of which their Prime Minister was the prototype, and many of them think that he is just the man for them, and that Mr. Disraeli's strength is waning. But they cannot yet make up their minds to beckon him over to their side. The outside world look on with interest and amusement at the divergence, and wonder how it will end. On the whole, they feel inclined to put their money on the skilful player—to the extent, at least, of backing him not to draw a blank.

## PARIS—HER CHURCHES AND RELIGIONS.

PARIS, January 1, 1875.

PARIS has been at all times the subject of a special literature. Many volumes have been written on the great capital, but, as it is continually in the process of transformation, the subject is never quite exhausted. At the time of the last great Exhibition held in Paris, Victor Hugo did not disdain to write a long preface for a book which was a mere guide. This preface is quite worth reading, though the great poet heaps Pelion upon Ossa, and represents Paris as a sort of living goddess of the Revolution. M. Maxime Ducamp, who was also once what we call a Romanticist, much given to metaphors and images, has during late years quite changed his manner—he has become a dry statistician, and has chosen Paris for his subject. He has published a work called 'Paris: Its Functions and Organs,' the very title of which has something rather repulsive, but which contains a curious mass of information: "rudis indigestaque moles." There is no literary merit in this great work, but the author has really felt much interest in his subject, and he has collected facts which are of great intrinsic importance. He has disdained nothing; he has counted the *chiffonniers* (rag-pickers), who go about in the night, lantern in hand, looking for something to pick up in the heaps thrown before the doors; he has entered the shops where false hair is prepared for the consumption of the whole world; he knows how many violet bouquets are sold in Paris in one year. He spends his time in the streets, looking at the strange sights of the great town, and nothing escapes his powers of vision. He has seen, as I have, the strange advertisement of a shop which announced a forced sale. There was a rival shop opposite, and both had failed. One put out a great placard, on which was read: "Our failure has been a sincere failure; the failure of our neighbor has been only simulated." I contented myself with contrasting this new pride in a *sincere* failure with the horror our ancestors felt for the *bonnet vert* (the green cap worn by merchants who could not pay their creditors). M. Ducamp goes further, and enquires into all the mysteries of the tribunal of commerce, of the *monts-de-piété* (pawnbrokers' shops, which in Paris are under the direct control of the administration).

M. Ducamp is a great admirer of the modern improvements of M. Haussmann, the Prefect of the Empire. He speaks with contempt of old Paris, of its narrow and dirty streets. I confess that I regret many parts of the city which have been destroyed. You cannot turn poverty out of a city of two millions of inhabitants. You can only hunt it, force it from one quarter to another quarter. Paris before the Empire seemed very beautiful to me. Some of the new boulevards are very useful; others are long, deserted avenues, open to all the winds, without any shade in summer. A city ought to be like a plant, not be too much forced. The debt of the city of Paris was on the 1st of January, 1854, only about 94,000,000 francs; on the 1st January, 1874, it had swollen to 1,794,000,000 francs. The new taxes fall very heavily on the poor, many of whom are now very far from their work, and obliged to find a refuge outside of the fortifications. The story of the expropriation of the old houses which were destroyed to leave place for new ones is full of scandals. A jury fixed the amount of the indemnities which had to be paid to the proprietors and to the lodgers; and a company was formed which undertook to defend the expropriated parties before the jury. The company procured lawyers, fabricated false leases, and extorted as much money as possible from the jury. It recouped a part of its expenses by levying ten per cent. on the indemnities. The corruption of that time cost Paris, as M. Ducamp estimates, at least 200,000,000 of francs. Many of the works begun before the war are now abandoned: "pendent opera interrupta." The whole energy of the city has been spent lately on the new Opera, which will be positively inaugurated next Tuesday. It is a monument of folly, and marks an era of decadence; it has cost already

50,000,000 francs, and will be intolerably expensive. It is calculated that the lighting of it alone, if it is efficient, will cost 1,200 francs every evening.

Most of the poetry of an old town is in its churches. Paris cannot be imagined without Notre Dame. The history of the Paris churches is the history of the capital. There are at present in it 1,760,000 Catholics. The Protestants are few in number, and consist of 20,000 Calvinists, 12,000 Lutherans, and 9,000 Protestants belonging to various sects. The little Calvinistic community is just now threatened with a division; there is an orthodox party and a liberal party, and they will perhaps soon cease to meet in the same temples. During the French Revolution, as in the short triumph of the Commune, all the churches and temples had been converted into clubs. Bonaparte, as First Consul, opened the churches again for the priests, and many of the Jacobins and regicides were angry with him. Napoleon was no believer himself; but he had been horrified at the number of people who, in the absence of any religious establishments, had begun to believe in sorcery; he wished, besides, to make an ally of the Pope, and to organize his power with the help of the clergy. When the Revolution broke out, Paris had 60 parish churches, 20 collegiate churches, 80 chapels, 3 abbeys of men, 8 abbeys of nuns, 53 convents for men, and 146 convents for women. Most of the churches are still in use. The beautiful tower of Saint-Jacques la Boucherie remains, however, alone in the Rue Rivoli, as the nave has been demolished. The Val-de-Grâce has become a military hospital. Mercier, in his 'Tableau de Paris,' writes: "People dance now at the Filles de Sainte-Marie; they dance at the Carmes, where the massacres of September took place; they dance at the Carmelites in the Marais; they dance at Saint-Sulpice." Notre Dame itself became for a time the church where Laréveillère-Lepeaux officiated as the chief of the neo-philanthropists. It is impossible to destroy the religious feeling in a community; dogmas cannot be attacked by laws. After so many years of Voltairianism, would you have a notion of the status of the Catholic Church in Paris at this day? The archdeanery of Notre Dame, one of the two religious districts of the capital, contains 49 churches; the archdeanery of Sainte-Geneviève, which covers the left side of the river, has 20 churches. There are, therefore, in all, 69 churches. The law has placed every possible hindrance in the way of the religious corporations: the system of trusts and of entails is strictly forbidden; all property is personal, and, so to speak, completely free. Still, the law can be evaded; and there are now in Paris 101 religious corporations—25 for men, 76 for women; they occupy 227 convents in the capital.

There is among the lower classes of the population a deep-seated hatred of the clergy, which was well shown during the Commune. This is all the more surprising inasmuch as the old abuses of the Catholic Church which shocked our ancestors before the Revolution of 1789 have all disappeared. A more respectable, moral, philanthropic body of men than the present priests of Paris could probably not be shown anywhere. Still, the first hostages chosen by the Commune were the Archbishop, the curate of the Madeleine, the Dominicans of Arcueil. There was in all the acts of the Commune a violent anti-religious character. M. Ducamp informs us that, in the year 1872, out of 45,780 funerals, there were as many as 5,341 *civil* funerals, in which no priest took any part. He calls this proportion a small one; to me it appears extraordinary. In the same year, out of 56,694 children born, there were only 48,763 children baptized. These numbers show conclusively that in Belleville, Montmartre, and those quarters, there is an infidel and pagan population, which hates all religions, the Protestant as well as the Catholic. There is no doubt that this population lives in the belief that the churches are merely the instruments of political oppression, the accomplices of the police and of the gendarmes. At the time of the Ligue, the religious feeling dominated the political passion; the hatred of the Huguenots which inspired the massacre of Saint Bartholomew, turned the Parisians against Henri IV., and made them the allies of the Spaniards. Now, it is just the reverse—the political passion is predominant. In the year 1831, the mob attacked and sacked the Archbishopric, because M. de Quélen was not a liberal; the Seine carried for a whole day precious books, manuscripts, and holy vestments.

It would be unjust to accuse the whole working population of sharing the sentiments which found vent during the Commune. You are sure to meet all the extremes in any great agglomeration of men. Robespierre well understood the people when he admitted the necessity of religious ceremonies. His fête of the Supreme Being was a disgusting farce; but Robespierre felt the power of ideas and of symbols. The Parisians had too much *esprit* to be satisfied with the sight of the priests of the Convention—they knew where the Goddess of Reason came from, and where she would return after the ceremony. The sentimentality of Rousseau became an object of ridicule when the four ages of mankind were represented by Parisian gamins, by drunken old men with fantastic beards, by nurses and hired babies. This theatrical religion was soon despised; even during the worst days of the Terror, when denunciation was constant, the poor Catholic priests who secretly administered the sacraments were very seldom denounced. The old consecrated days of Pentecost, Easter, etc., were still considered as holidays. I have often noticed in the popular theatres that the religious sentiment, when it is expressed on the stage, does not offend the audience. During the siege of Paris, the statue of Strasbourg on the Place de la Concorde was not the only shrine of the Parisian population; the Virgin of Nanterre was constantly decorated with tricolor ribbons, and in the end was quite overwhelmed by them. The Abbé Bossuet, who belongs to the same family as the famous Archbishop of Meaux, and who is now the curate of Saint Louis in the Island of the Seine, one of the poorest quarters of Paris, told me that he remained in Paris, during the Commune, in his presbytery, and none of his parishioners denounced him to the Commune. The work of the missionaries is difficult in the infidel quarters, as their only chance there is a great gift of eloquence. The Parisian workingman, accustomed to the theatres, quite permeated with a certain sort of light and ironical *esprit* which pervades the press, the workshops, the cafés, cannot be easily moved. You must either flatter his most wicked passions, as do the orators of the clubs, or astonish him. Very few preachers can do this. The most popular at the present moment is a young officer, who has the missionary passion, and who never speaks to any but popular audiences. The people admire his dash, his sincerity; they respect his uniform; and he is said to have done wonders in some of the worst quarters of the capital. But there are very few men like M. de Mun who have an apostle's soul under the helmet of a dragoon.

Paris is an inexhaustible subject. I have only touched to-day on its religious character. It may be made the object of many studies of this kind; the materials are almost too numerous, and one feels lost in the midst of them, as a foreigner gets lost in the intricacies of the streets of an old quarter. D'Aubigné calls Paris "cette spélunque de bêtes farouches" (this cavern of wild beasts). Michelet and Victor Hugo proclaim her the Holy City, the Jerusalem of the new Gospel of Humanity.

# Correspondence.

## THE INTERCOLLEGIATE CONTEST.

To the Editor of The Nation:

Sir: I think you deserve the thanks of all friends of sound scholarship and the "higher" education for your remarks in the last *Nation* on the recent "intercollegiate contest" in New York. Great respect is of course due and paid to the eminent men who lent their presence on that occasion, and it may be admitted that Col. Higginson's estimate of the productions of the essayists and speakers is correct. All this, however, does not touch the real questions which should first be considered—how will such contests affect the proper work of our college students, and what is the more general effect of such public exhibitions on the actors and the community of college students? The right answer to these questions does not seem to me doubtful, or to depend at all upon the credit with which the actors may acquit themselves. It is clear to my mind that our college students have greatly advanced in their capacity for work, or the requirements of our respectable colleges have been greatly lowered within the last few years, if such contests will not directly and necessarily result in a very harmful interference with the proper work of college students. By proper work I mean simply due attention to the prescribed duties of the college course. I would lay down the rule, and if it were not for the adage about exceptions proving the rule, I would say this rule has no exception, that a college student's first duty and interest is to do the work of the recitation and lecture-room thoroughly. I should say further from my own observation that this work will completely fill up the time of ninety-nine out of every hundred students, so that this "side-show," to speak a little irreverently, could properly be kept up by only a very insignificant numerical fraction of students. I am also very certain that this fraction will not embrace those who will figure in any "intercollegiate" contests. No matter, then, how brilliant the display or how keen the rivalry attending such contests, their inevitable influence is antagonistic to the best interests of our students. The conservative influences of real knowledge and thorough discipline are supplanted by those influences which must attend an effort at the public exhibition of immature powers and superficial or imperfect knowledge.

But if there were time and place in a faithful student's college course

for any outside literary or oratorical contests, I think this kind of public contest is specially objectionable. Does a public contest before such an audience as was recently assembled in New York furnish the true sort of incentive to students in the midst of college life? Do they need such incentives? I can hardly think of any influences less likely to promote good scholarship or habits of patient study and reflection. The applause of a general audience is not what a college student needs. He needs the habits of study and the power of acquisition; and if I were to suggest any change in the ordinary college course, it would be in the direction of more plain, silent study and less writing and speaking, especially before general audiences. There is a time for all things, I suppose, but the time for such public contests is not while students should be fully occupied with labors which, if properly conducted, will in the end best fit them to deserve and win the attention of the public.

The absence of Harvard and Yale from the recent contest appears significant, and is the result, I am glad to believe, of a just reaction against the practice of judging a college student by what he can *say* rather than by what he *knows*—by what he appears to be rather than by what he is.—Yours truly, D. H. Chamberlain.

Columbia, S. C., January 18, 1875.

# Notes.

F. B. PATTERSON, 32 Cedar Street, has reprinted in a neat pamphlet the late James W. Gerard's paper on the "Old Streets of New York," read last year before the Historical Society. He also purposes publishing, in the course of the present year, a 'Pictorial, or Panoramic, History of Old New York,' consisting of fac-similes of early maps, views of buildings, etc., etc., without text.——Bigelow's 'Life of Franklin,' which has heretofore been sold by subscription only, is now, we are glad to say, obtainable of the publishers, J. B. Lippincott & Co., and of the trade generally. ——Ginn Bros., Boston, publish immediately a text-book of Ovid, edited by Messrs. Allen and Greenough, and uniform with their Virgil.——'A Concordance to the Iliad of Homer,' by Mr. Guy Lushington Prendergast, who was, according to the *Athenæum*, engaged upon the compilation of it from 1847 to 1863, has just been completely printed, in two parts.——The vexed Eastern Question, which is now in the midst of one of its periodical crises, has been elaborately and ably treated in a new work, entitled 'L'Empire Ottoman au point de vue politique vers le milieu de la seconde moitié du XIXe siècle.' The author, Mr. Edward Scrosoppi, was born in the East, of Italian parentage, and has made a life-long study of the antiquities, history, and political condition of Turkey. His work is in three parts, occupying as many volumes.——The first part of the second volume of Mommsen's 'Römische Staatsrecht' contains the detailed treatment of the several magistracies, beginning with the office of King and ending with the extraordinary magistracies (Decemvirate, etc.) of the Republic. The second part is announced as in the press, and to appear at Easter. Nothing is said as to its scope, but it seems likely that it will treat of the magistrates of the Empire. The third volume will take up the assemblies, etc. The key to the theories of the present volume is found in the expression (p. 694) that "the Roman monarchy was never abolished either in form or substance, but only changed its name, being restricted especially by obligatory *Provocatio*, collegiality with equal powers, and year's tenure of office."——We have received the first number (for February) of the *National*, a new monthly illustrated magazine published at Washington, and designed, we believe, to confirm the pretensions of that city to be regarded as one of the literary centres of the country. For our part, we see no reason why it may not in time become one. How far the *National* is going to furnish evidence of its capacity to shine in literature remains to be seen, as the present number is confessedly imperfect and unsatisfactory to the new proprietors. The "Science Notes" are under the charge of Dr. Theodore Gill, but no other name among the collaborators has anything like the weight of his.——Mr. F. W. Putnam, of the Peabody Academy of Science, Salem, has been appointed Curator of the Museum of Archæology at Cambridge, as the late Jeffries Wyman's successor. No one more competent could have been selected for this position.——A venerable and much respected American poet died in Boston on Thursday last—Charles Sprague, born, near the spot where he died, in 1791. The successes which gave him a reputation date back nearly or quite half a century, and his literary productiveness ended many years ago. He was for forty years cashier of the Globe Bank in his native city, which he seldom left. It is stated indeed, that he never entered a steam-car but once.

—In the "Monthly Gossip" of the February *Lippincott's* occurs an announcement of no little literary interest. It is there positively and circumstantially stated that the English translator of Omer Khayyám's 'Rubáiyát' is Mr. Edward Fitz Gerald, of Woodbridge in Suffolk, a gentleman whose pedigree all the world may consult in Burke's 'Landed Gentry,' himself (born in 1809) a graduate of Trinity College, Cambridge, "where among his contemporaries and friends were the present poet-laureate and Mr. Spedding." His published works are thus enumerated: (1) 'Euphranor, a Dialogue on Youth,' 1851 and (second ed., with an appendix) 1855; (2) *Polonius: A Collection of Wise Saws and Modern Instances*, 1852; (3) *Six Dramas of Calderon*, 1853—the last being both in prose and verse, and comprising "The Painter of his Own Dishonor," "Keep Your Own Secret," "Gil Perez the Gallician," "Three Judgments at a Blow," "The Mayor of Zalamea," and "Beware of Smooth Water." To the dramas Mr. Fitz Gerald first allowed his name to be appended as translator. He has also printed privately two small volumes of translations—the 'Agamemnon' of Æschylus, and two plays from Calderon again: "Life is a Dream," and "The Wonderful Magician." His metrical Persian translations include besides the 'Rubáiyát' the "Bird-Parliament," from Attár's "Mantiq-ut-tair" (unprinted), and "Salámán and Absál." Mr. Fitz Gerald's name, it is pointed out, has been overlooked by Allibone, which is hardly surprising, considering the late date at which he revealed his authorship; but Pennsylvanians may see additional cause to regret the omission in the fact that he married Lucy, daughter of Bernard Barton, the Quaker poet. "Everything that he has produced," says the gossiper, "is uniformly distinguished by marked ability; and, such being the case, his indifference to fame, in this age of ambition for literary celebrity, is a phenomenon which deserves to be emphasized."

—Recovery of the Murillo stolen from the Cathedral of Seville has been effected in this city with some rather dramatic accompaniments. On the 7th instant the Spanish consul was informed by Mr. William Schaus, the expert and art importer, that a canvas corresponding with the missing part of the altar-piece had been offered to him by some Spanish strangers. Señor de Uriarte saw the picture and compared it with the photograph of the original furnished to all Spanish consuls, which it proved to match precisely. The photograph in question shows the entire subject of St. Anthony of Padua beholding the vision of the Holy Child Jesus, the exact outline of the cutting being represented by a white trace. The cut portion, less than a fourth part of the canvas, contains the kneeling form of the Saint, as represented in the lower right-hand corner of the composition. The stolen figure had not been cut into strips as reported, except that one corner of the cloth, where the purloiner's knife had made an awkward slant at the most distant part of its orbit, was mended out by the addition of a supplementary triangle. The fragment, forming a rough oval about seven feet high, had been tacked to a new square American-made stretcher, and had previously been very badly handled, the eye and nose, as seen in the profile, having almost entirely peeled off; the cloth had obviously been packed for concealment, like a smuggled shawl or tapestry, without much care for its profitable preservation. The person holding it, apparently a catspaw, offered it to the dealer at almost any price, and when pressed to name a figure suggested only $250 or $300; for the former sum it was secured by Mr. Schaus, who passed it to the consul within twenty-four hours for the mere reimbursement of his outlay, though the rewards offered by the political and ecclesiastical authorities amount, we are told, to sixty thousand dollars. There are indications that the holders of the painting were considerably embarrassed with their possession, and had previously attempted to pass it off with a score of indifferent Spanish canvases to a picture-cleaner, Mr. Vollmering. The consul, being duly notified, arrested the seller at the time of his completing the bargain with the money in his pocket; he calls himself Fernando Garcia, and protests innocence, though he had represented the painting to Mr. Schaus as a treasure long owned in his family. In company with a detective he has returned to Spain again with his picture, by way of Havana. Thus the chapel in the Seville Cathedral regains, if there is no counterfeiting in the case, its complete altar-piece; and the Saint, having travelled six thousand miles on his knees, resumes his old station after a wider career than those of Raphael's cartoons or the Elgin marbles. The seller of the picture has left behind him a friend, one Antonio Somariba, who protests strongly against the arbitrary way in which the pair of them were arrested, and laments that he has not funds to prosecute the detective. One would think, however, that such money could readily be raised among the Cuban party here, who have stormed about the "inquisitorial" proceeding of the Spanish power with delighted ardor.

—In 1837, a gentleman in Baltimore, named John Hopkins, procured the incorporation of a university, to be called by his name, and by gift at that time, and subsequently by bequest, endowed it with about $3,500,000, not in wild lands either, but mainly in such solid securities as stock of the Baltimore and Ohio Railroad. The persons composing the corporation, twelve in number, are men of the highest character and standing in Baltimore—lawyers, doctors, and merchants. Moreover, Mr. Hopkins left nearly as much more money to found an hospital beside the university, thus giving the latter the opportunity of building a medical school of the first order. The money is left, too, to the corporation, who fill their own vacancies, absolutely untrammelled by any condition or reservation, political, religious, or literary, except the establishment of scholarships for the benefit of students from Maryland, Virginia, and North Carolina. The endowment may, therefore, be called unprecedented both in its freedom and liberality. The trustees can found any kind of university they please, and they have thus a power which has never before been lodged in the hands of any body of men in this country. When we first heard of it we confess we felt little interest in it, concluding that we were simply to witness the addition of one more to the huge array of high schools which the country already possesses, in which poorly-paid professors would labor year after year in the dull and dead routine of giving a "university education," by teaching Latin, Greek, and mathematics, and perhaps a smattering of natural science, to half-prepared boys or girls, or both. But luckily this great endowment has fallen into the hands of men who have a higher idea of their responsibilities, and they intend to use it for the foundation of a real "seat of learning," or, in other words, for enabling the country to play its proper part in the best intellectual work of the day, feeling assured that the preparation of boys and girls to earn a livelihood will be abundantly looked after by other institutions. They accordingly sent for President Gilman of the California University, and asked him what he would do if he were put at the head of the new enterprise and were left perfectly free. He said in substance that he would make it the means of promoting scholarship of the first order, and this by only offering the kind of instruction to advanced students which other universities offer in their post-graduate courses, and leaving the kind of work now done by undergraduates to be done elsewhere. For this purpose he would select as professors men now standing in the front rank in their own fields; he would pay them well enough to leave them at their ease as regards the commoner and coarser cares; would give them only students who were far enough advanced to keep them constantly stimulated to the highest point; and he would exact from them yearly proof of the diligent and fruitful cultivation of their specialties by compelling them to print somewhere the results of their researches. Now, what this means, and how great a contribution it would be to the intellectual progress and fame of the United States, may be inferred when we say that we could at this moment name twenty men, employed at small salaries in existing colleges, whose work in certain fields of research would be of inestimable value to the science and literature of the world, but who are compelled, in order to earn their livelihood, to pass most of their time teaching the rudiments to boys, or preparing school-books; and that American graduates who would like to pursue certain lines of culture to their latest limits are compelled every year either to go abroad or content themselves with the necessarily imperfect aid which they can get in the post-graduate courses from overworked and half-paid professors who are doing the duty of schoolmasters. One of the results of the present state of things—and none see it more plainly than those who like ourselves are called on every week to compare the results of the intellectual activity of Europe with our own—is that our intellectual progress bears no sort of proportion to our progress in the accumulation of wealth and in the mechanical arts. To the higher thought of the world we contribute shamefully little. The books that rouse and stimulate men in the various great fields of speculation to-day are almost invariably European, and it shows what a mental condition some of us have fallen into, that it has been seriously proposed, within a few years, to remedy this state of things by putting a heavy customs duty on the products of the European mind—a proposal worthy of the year 1000. We are glad to say that the Hopkins trustees fell in cordially with Mr. Gilman's terms, offered him the presidency of the new institution, and that he will probably accept it. It is a great opportunity, and we hope and believe it will be rightly used.

—The February number of the *Popular Science Monthly* contains Professor Tyndall's "Reply to the Critics of the Belfast Address." The reply is only partly exculpatory, and is largely devoted to a vigorous attack on the Holy Father and the Church which he represents, and to an exposition of the ignorance and superstition of the professors of the Catholic faith. In this Mr. Tyndall is, of course, completely successful, and as he recapitulates the grievous scientific errors and mortal sins into which the Church has at different times fallen—the ringing of the church-bells all over Europe to scare away Halley's comet in 1456, the decree of 1616 denouncing the Copernican system and "suspending" all books teaching it, the persecution of Galileo, and so on—the reader, if he is a scientific man or a Protestant, cannot but feel a glow of satisfaction in reflecting that he is not absurd enough to be a Catholic. The "Reply" also gives us some interesting biographical details about Mr. Tyndall himself. Born in Ireland, he belongs to one of those Irish-Protestant families which for many generations had been taught, from father to son, to hold their own against the Church of Rome. To quote his own words:

"I had a father whose memory ought to be to me a stay, and an example of unbending rectitude and purity of life. The small stock to which he belonged were scattered with various fortunes along that eastern rim of Leinster, from Wexford upward, to which they crossed from the Bristol Channel. My father was the poorest of them. Still, in his socially low but mentally and morally independent position, by his own inner energies and affinities he obtained a knowledge of history which would put mine to shame; while the whole of the controversy between Protestantism and Romanism was at his finger-ends. At the present moment the works and characters which occupied him come, as far-off recollections, to my mind: Claude and Bossuet, Chillingworth and Nott, Tillotson, Jeremy Taylor, Challoner and Milner, Pope and McGuire, and others whom I have forgotten, or whom it is needless to name. Still this man, so charged with the ammunition of controversy, was so respected by his Catholic fellow-townsmen, that they one and all put up their shutters when he died. With such a preceptor, and with an hereditary interest in the Papal controversy, I naturally mastered it. I did not confine myself to the Protestant statement of the question, but made myself also acquainted with the arguments of the Church of Rome. I remember to this hour the interest and surprise with which I read Challoner's 'Catholic Christian Instructed,' and on the border-line between boyhood and manhood I was to be found taking part in controversies in which the rival faiths were pitted against each other. I sometimes took the Catholic side, and gave my Protestant antagonist considerable trouble."

In this way, he says, the views of Irish Catholics became intimately known to him, and he vouches for the fact that "there was no doctrine of Protestantism which they more emphatically rejected, and the ascription of which to them they resented more warmly, than the doctrine of the Pope's personal infallibility." Yet, in face of this knowledge on his part, he declares that it was some time since obstinately asserted and reasserted in his presence, by a Catholic priest, that "the doctrine of the infallibility of the Pope has always been maintained in Ireland."

—Elsewhere in his reply Mr. Tyndall discusses the allegation that at Belfast he misused his position "by quitting the domain of science, and making an unjustifiable raid into the domain of theology." This, he says, he fails to see any foundation for, inasmuch as Kant, Laplace, and William Herschel were guilty of exactly the same offence. They, too, "prolonged the intellectual vision beyond the boundary of experience, and propounded the nebular theory."

"Accepting that theory as probable, is it not permitted to a scientific man to follow up in idea the series of changes associated with the condensation of the nebulæ; to picture the successive detachment of planets and moons, and the relation of all of them to the sun? If I look upon our earth, with its orbital revolution and axial rotation, as one small issue of the process which made the solar system what it is, will any theologian deny my right to entertain and to express this theoretic view? Time was when a multitude of theologians would be found to do so—when that arch-enemy of science which now vaunts its tolerance would have made a speedy end of the man who might venture to publish an opinion of the kind. But that time, unless the world is caught strangely slumbering, is for ever past. As regards inorganic Nature, then, I may traverse, without let or hindrance, the whole distance which separates the nebulæ from the worlds of to-day. But only a few years ago this now conceded ground of science was theological ground. I could by no means regard this as the final and sufficient concession of theology; and at Belfast I thought it not only my right but my duty to state that as regards the organic world, we must enjoy the freedom which we have already won in regard to the inorganic. I could not discern the shred of a title-deed which gave any man, or any class of men, the right to open the door of one of these worlds to the scientific searcher, and to close the other against him. And I considered it frankest, wisest, and in the long-run most conducive to permanent peace, to indicate without evasion or reserve the ground that belongs to science, and to which she will assuredly make good her claim."

One would suppose from this that in his Belfast address Mr. Tyndall only expressed a belief in the connection by development between organic and inorganic nature. But this has been done by many people before him without creating any hubbub. The objectionable and unscientific thing which has caused all the trouble was his declaration that he discerned in matter "the promise and potency of every form and quality of life," stating, or seeming to state, that matter was the *causa causans* of the universe. We fail,

for our part, to make out from this reply what is the precise kind of materialism for which Mr. Tyndall is willing to be held responsible, but from an editorial article in another part of the *Monthly* we infer that it "consists simply in ascribing higher powers and possibilities to matter than hitherto, and not in sinking mind in matter, or in asserting the materiality of mind in the name of scientific authority"—certainly a harmless, though perhaps for one who wishes disciples a vague, faith. Substantially, his reply to those of his assailants who have given him notice to quit theological ground, is that he is not and never has been a trespasser, but is a law-abiding scientist and has kept carefully on his own side of the boundary, about which line, however, he keeps moving with such surprising agility that no merely human eye can make out whether his defence is valid or not.

—With Charles Kingsley, who died in England on Sunday, has passed away one of the most widely known English writers of the present time. Mr. Kingsley, although not an old man at his death—he was in his fifty-sixth year—had in a measure outlived his earlier fame; but those who recall the literary events of twenty years ago will remember the appearance of his three or four novels—his chief title to remembrance—as not the least important among them. Mr. Kingsley had indeed not only outlived his earlier fame, he had even in some degree damaged and discredited it; and yet it may be said that 'Westward Ho!' and 'Hypatia' have not suffered by their kinship to their less happily begotten brothers. Their author was a striking example of a man who had a certain limited message to deliver—whose cup was filled, at the most, but halfway up to the brim. While the prime impulse lasted the result was admirable, so much so that one who vividly remembers it and who was at the time getting his initiation into the literature of the day, has to make an effort to write of it at all judicially; but its days were numbered, and, though the cup was still offered for our entertainment and edification, one felt that the contents had been diluted and that the liquid had but a vague taste of its early potency. Mr. Kingsley played a number of parts, and his career was a busy one. If one wished to mention his most comprehensive rôle, one would of course allude to him as the exponent of "muscular Christianity." We are not able to say whether he invented the term, but practically he did most to propagate it. In this direction—and in this one only—Mr. Kingsley founded a school and exerted a sensible influence. The influence in many ways was for great good, and it is not the fault of the author of 'Westward Ho' and 'Yeast' if 'Guy Livingstone' *et hoc genus omne* have all, and more than all, the foibles of his manner, and none of its virtues. Mr. Kingsley had entered the Church, and was thus able to emphasize the Christian side of his philosophy as well as the muscular; but it was, nevertheless, as presented in his novels rather than in his sermons (of which he published several collections), that the public chiefly relished it. In so far as it was in any definite degree a philosophy, it was the philosophy of Mr. Carlyle condensed and popularized, and addressed rather to the comprehension of the younger members of the community. Like the author of 'Sartor Resartus,' the author of 'Alton Locke' was an extreme Liberal, and if he had continued to advance in the direction taken by this volume, he would have found himself at the present day in rather startling company. But Mr. Kingsley never advanced very far in any direction; he had always, as the phrase is, a great many irons in the fire, but he suffered none of them to get thoroughly heated. 'Alton Locke,' as a Radical manifesto, had no successors, and in the author's later novels we mingle much more in high life than in low. Mr. Kingsley was always what is called a "hearty" writer; he wrote with an air of high animal spirits, and often in an admirably picturesque style; but to our sense, which was perhaps fastidious, the note of simple sincerity was rather wanting. 'Alton Locke,' as we remember it after the lapse of many years, had a natural heat and youthful candor which never reappeared. In 1856, if we are not mistaken, Mr. Kingsley published the novel of 'Two Years Ago,' which marked his highest tide of success. After this, we think it will not be denied, his inspiration ebbed most sensibly.

—It often seemed to us regrettable that Mr. Kingsley was not either a good deal more or a good deal less of a serious writer. His didactic effort, in its later developments, such as his Lectures on Modern History at the University of Cambridge, was sufficient to obstruct his imagination, but not in itself of any great illuminating force. As a reasoner, and indeed as a moralist, Mr. Kingsley was very weak, and he had been so strong as a story-teller before he assumed these responsibilities, that his old admirers always bore him, in his other capacity, an obstinate grudge. A capital novelist was spoiled to make a very indifferent historian. Six months hence, probably, critics will lay aside any present hesitation they may have in saying that 'The Roman and the Teuton' and the lectures on the Ancien Régime were very singular contributions to historical science from a Cambridge professor. Mr. Kingsley's enterprise was to demolish history as a science, to prove that all human things depend upon the "valiant man, God helping," etc. His career at Cambridge was brief, and added distinction neither to the University nor to his own record. Mr. Kingsley's vagaries as a moralist may perhaps best be illustrated by reference to the "moral" support which, in company with Carlyle and others, he offered to Jefferson Davis and Governor Eyre. Mr. Kingsley's opinions, by this time, had become very favorable to the aristocracy. Our readers have not, perhaps, forgotten at what cost to his tranquillity he paid his famous compliment to the upper class—assuring it that it possessed all the good looks and half the good morals of England. (We do not pretend to give the exact formula, but this was about the sense of it.) Such leanings are of course perfectly legitimate; all we can say is, that it is a pity to mix incongruous things; to pretend to philosophize without the philosophic instinct, and to make one's personal tastes do duty as dogmas. The danger with those tastes of which Mr. Kingsley made himself in a manner the prophet, is that the merely brutal side of them may come uppermost; that the "valiant man," even with God's help to do otherwise, may run too much to brawn and muscle and become obtuse in his moral perceptions. Mr. Kingsley was the apostle of English pluck, English arms and legs, and the English sporting and fighting temper generally, and he has given some admirable illustrations of these fine things; but we imagine that the accepted Kingsleyan type of manhood has lately come to be regarded as having a certain inadequacy. The average well-developed young Englishman of the present moment would be likely to feel that it offered a meagre allowance for the stowage of the cerebral parts. The type has played its part bravely, however, and we should be sorry to speak of it with anything but gratitude. Mr. Kingsley will retain a place in our literary history as a rather rash and indiscreet man of genius, with a taste for deeper waters than his intellectual stature warranted his attempting; or rather, to speak more justly, his indiscretions, his lectures, his essays (happy passages as there are in many of these) will be forgotten, and he will be judged by those two or three novels which represent his genius at its best. These in their way are admirable, and their influence in this country and in England has been wide, and, taken altogether, very wholesome. It is not too much to say that they have been part of the mental development of most of the young people growing up during the last twenty-five years. Mr. Kingsley offered the singular spectacle of a man whose imagination died a natural death in its prime, as it were; but while it lived, it was vigorous and splendid. If we picked out half-a-dozen modern English novels for the use of posterity, one of them, and one of the first, would certainly be 'Westward Ho!' We should add to this three or four of the author's admirable songs, which indeed posterity, left to itself, is likely to continue to sing.

—Mr. MacGahan's book describing his adventures in pursuit of the Russian army in its campaign against Khiva, and after joining it, interesting as the book is and useful, admits obviously of the addition of details from those who accompanied some one of the branches of the expedition through its whole march, and also of some enlargement as a history of military enterprise. The full narrative of the Orenburg (MacGahan's) detachment, with all its incidents, is told very agreeably by a gentleman who was assigned to this division as physician and surgeon, Dr. Grimm, in the "Reise-Eindrücke eines russischen Militair-Arztes" in the *Russische Revue*, No. II. for 1874. Dr. Grimm mentions a fact that MacGahan has perhaps noted, though we do not remember it in him, that the cylindrical hat of black sheepskin worn by the Khan's subjects presses the ears down and forwards, and that this disfigurement, which occurs elsewhere only in a few Afghans who are distinguished from the Khivese otherwise by their garments, serves in Central Asia as a mark of the Khivese. The expedition considered in its military aspect, with comments upon Russian policy in Central Asia from the favorable side, and a history of the campaign "nach den Quellen," are presented by another writer, Emil Schmidt, in about two hundred of the large octavo pages of the magazine, Nos. IV., V., VI. and VII. (twelve numbers of the *Revue* are published in the year, beginning with January, but at irregular intervals). This author, who, as might be expected, is the later writer, corrects a few errors in other descriptions of the expedition, especially Stumm's, and in maps published in Petermann. He gives also, in about twenty pages, a list of all the works relating to Khiva from the earliest times, beginning with the Zendavesta, and concluding with narratives treating particularly of the expedition. Both Grimm's narrative and Schmidt's have been published separately in St. Petersburg; neither of them has a map of the country, as has P. Lerch's 'Khiva oder Khârezm,' also published separately from the *Revue*, and highly praised by

Schmidt. Lerch's book discusses principally the earlier writers upon Khiva up to the seventeenth century.

## MR. GREVILLE'S JOURNAL.*

MR. GREVILLE belonged to a more leisurely generation than our own, and he is a singularly complete example of the amateur annalist. Born in an aristocratic circle; intimate with all the social magnates of his time, and related to many of them; holder of a political office which gave him the "inside view" of public people and affairs, and yet was enough of a sinecure to leave him liberty and time for thinking and writing after his own fashion; observant, shrewd, sagacious, cultivated, too, in a fair degree, in spite of his disclaimers—he had the happy inspiration very early in life of taking copious notes of what he saw and heard, the perseverance to continue the practice for half a century, and the talent to make his observations extremely luminous and interesting. In 1818, when he was barely twenty-four years of age, he resumed a Journal which he had already begun and interrupted, "because," as he says, "having frequent opportunities of mixing in the society of celebrated men, some particulars about them might be interesting hereafter." With this simple remark he ushers in this extremely voluminous record of the political and social events of his time, of which the first instalment, coming up to the year 1837, fills two stout, closely-printed volumes. The remainder, from the accession of Queen Victoria to the close of the author's life in 1865, is withheld for the present, in deference to contemporary susceptibilities. The author fulfils the first duty of a memoir-writer—that of being frank; and if his treatment of the people of our own immediate day may be measured by his treatment of their fathers and grandfathers, there will be high entertainment, in the volumes yet to come, for their children and grandchildren. It is not that he is a scandal-monger, but something that is, on the whole, more uncomfortable. Scandal may be set down as scandal, and abusive tales may easily be too heavily weighted to float. Mr. Greville is discreet, temperate, irreproachable in tone, never scurrilous. But, on the other hand, he is full of common sense; he has an extreme directness of vision; he looks at things and people (people especially) for himself; he is the victim of no sentimental illusions nor social superstitions; he calls a spade a spade in all cases, and he brings his really penetrating observation to bear on great people and small with an uncompromising instinct of truth. In this way he pronounces a great many cutting judgments and registers an immense variety of unflattering characterizations. Much of it is just such talk (minus the gossip which is mere gossip, and which he consistently eschews) as Mr. Greville might have had any evening with a sympathetic friend during the last half-hour before going to bed—talk always with a little moralizing in it; enough to keep it from being frivolous, but not enough to keep either party awake. He tells no startling secrets and he alludes to few enticing mysteries; but his narrative has constantly a savor of which this, for instance, is a brief example: "I have had a squabble with Lady Holland about some nonsense; but she was insolent and I was fierce, and then she was civil, as she usually is to those who won't be bullied by her"; or this, even about Mrs. Somerville: "I could not then take my eyes off the woman, with a feeling of surprise and something like incredulity, all involuntary and very foolish; but to see a mincing, smirking person, fan in hand, gliding about the room, talking nothings and nonsense, and to know that Laplace was her plaything and Newton her acquaintance, was too striking a contrast not to torment the brain. It was Newton's mantle, trimmed and flounced by Muradan." These are light instances, chosen for brevity; we might quote fifty others, notes on Lord Anglesey, on Peel, Brougham, Palmerston, Macaulay, and the author's innumerable political acquaintances—all having the precious stamp of private judgment, of that *real* impression which, in society, it is so hard to ascertain. On persons lifted up higher into the light, Mr. Greville's unreserve is proportionately complete. George IV. and William IV. are given us in a series of touches which form at last, in each case, a full-length portrait of a formidably veracious cast; poor, plain Queen Adelaide is very far from flattered; the Duke of Wellington is handled like an ordinary mortal and (in politics) a very bungling one. Mr. Greville is not a Saint-Simon; but the earlier portions of his Journal, relating to the person and *entourage* of George IV., have not a little of the incisiveness and color of that immortal scribbler.

Mr. Greville was Clerk of the Council under the two sovereigns we have mentioned—a position which made him pass his whole life in a political atmosphere, at the same time that it gave him no political responsibilities. He was a Whig and a Liberal (as the term was understood forty years ago), and although he was a complete man of society, he was quite capable of taking general views, and, when he speaks of the future, making serious reflections. His Journal has an under-current of melancholy, and if he was not exactly a bilious observer, he was by no means an optimist. "He is half-mad, eccentric, ingenious," he says of a politician of his time, "with a great and varied information, and a coarse, vulgar mind, delighting in ribaldry and abuse, *besides being an enthusiast.*" That is Liberalism tempered by good-breeding; but when he says (in 1829) "I am convinced that very few years will elapse before the Church will really be in danger. People will grow tired of paying so dearly for so bad an article"; or when he talks, apropos of the cholera in 1832, and the misery revealed by the investigations of the Health Commissioners, of "the rotten foundation on which the whole fabric of this gorgeous society rests" ("Can such a state of things permanently go on?" he asks. "Can any reform ameliorate it?") when he exclaims, over the dulness of his Journal, "What can I make out of such animals as I herd with, and such occupations as I am engaged in?" and when, in a dozen different places, he repines at his wasted life, his having played no part and made nothing of himself, he takes us into the confidence of a person who, in the intervals of dining-out, of parliamentary debates and horse-racing, finds human life decidedly less brilliant than it would seem that these occupations ought to make it. Mr. Greville had a passion for the turf, owned some famous horses, and spent at Newmarket and Doncaster an amount of time which in his melancholy moods he bitterly grudges. He was a gentleman, not only socially but intellectually, and he continued to the end to find something wanting in the conversation of horsey people. He never married, and his long life was passed in London and in country visits. In 1830 he made a journey to Italy, where he still faithfully journalizes, and quotes (and, indeed, perpetrates) indifferent verses. Six years later he paid a visit to Paris, but these are the only absences mentioned during a period of nearly twenty years. All this time—from the end of the Regency to the accession of the present Queen—he kept his eyes fixed on the shifting panorama of English politics, and noted minutely the ins and outs, the ups and downs, of parties, of leaders, of measures and tendencies. It is, of course, as a contribution to English political history that this work has most value, and American readers in general will find (especially in the second volume) a bewildering excess of detail on matters with which they are scantily conversant. It is in a great measure the secret history of everything which was either planned or performed under six or eight successive administrations.

Mr. Greville was not the rose, but he lived near the roses, and he discussed things, sooner or later, with every one of consequence, from the two kings and the Duke of Wellington, from Talleyrand and the Princess de Lieven, down to Beau Brummel, Mr. Batchelor the valet of George IV., Theodore Hook, and the numerous Fitzclarences, illegitimate progeny of William IV. Every one passes before him, and he has something to say—some anecdote to relate, some *mot* to register, some reflection to slip in, about every one and everything. He turns inside out, as it were, one after another, the governments of the Duke of Wellington, of Lord Grey, of Sir Robert Peel, of Lord John Russell, of Lord Melbourne, of Lord Palmerston. Much of his journalizing on all these matters seems to us at this distance of time a rather wearisome imbroglio, for the questions at issue have long ago lost their actuality. Reform, as Mr. Greville impatiently invoked it in 1830, and as the Duke of Wellington blindly and doggedly resisted it, has been rather cast into the shadow by the long strides of Mr. Gladstone and John Bright. Mr. Greville's goal has been for some time our starting-point. Nevertheless, the interest of such memoranda—that of seeing how events and actions looked at the moment of their occurrence—is permanent, and in our author's narrative, at numberless points, we seem to breathe the moral atmosphere of the time. Returning again and again to certain of the leading actors in public affairs, with one touch confirming or correcting, or illuminating another, he ends by giving us a number of very lifelike and really brilliant portraits. Few readers who have not already been exceptionally initiated but will feel that after reading these pages they know the Duke of Wellington and Lord Brougham in a more intimate way than they could have expected. Anecdotes of the personal kind are especially abundant in the first volume, and the most pointed ones, perhaps, cluster about the personality of that magnanimous ruler, George IV. Mr. Greville regarded his sovereign with a wholesome contempt and never spares him a thrust. It was supposed that by this time we knew all about him, but Mr. Greville really vivifies our knowledge. "The fact is that he is a spoiled, selfish, odious beast, and has no idea of doing anything but what

* 'A Journal of the Reigns of King George IV. and King William IV. By the late Charles C. F. Greville, Esq.' In two volumes. New York: D. Appleton & Co. 1875.

The same, abridged in Bric-a-Brac Series. New York: Scribner, Armstrong & Co. 1875.

is agreeable to himself, or of there being any duties attached to the office he holds."

"He leads," says Mr. Greville elsewhere, "a most extraordinary life—never gets up till six in the afternoon. They come to him and open the window-curtains at six or seven o'clock in the morning; he breakfasts in bed, does whatever business he can be brought to transact in bed, too, he reads every newspaper quite through, dozes three or four hours, gets up in time for dinner, and goes to bed between ten and eleven. He sleeps very ill, and rings his bell forty times in the night; if he wants to know the hour, though a watch hangs close to him, he will have his *valet de chambre* down rather than turn his head to look at it. The same thing if he wants a glass of water; he won't stretch out his hand to get it."

Mr. Greville writes of this monarch in a tone of irritation, and we can imagine that it must have been rather a tax on one's patience to have to show especial civility to a corpulent voluptuary of this particular pattern. William IV., with his awkward, blundering, boisterous, garrulous activity, is sketched with an even greater multitude of touches:

"His ignorance, weakness, and levity put him in a miserable light and prove him to be one of the silliest old gentlemen in his dominions; but I believe he is mad, for yesterday he gave a great dinner to the Jockey Club, at which (notwithstanding his cares) he seemed in excellent spirits; and after dinner he made a number of speeches, so ridiculous and nonsensical, beyond all belief but to those who heard him, rambling from one subject to another, repeating the same thing over and over again, and altogether such a mass of confusion, trash, and imbecility as made one laugh and blush at the same time."

It was after one of the King's speeches of this kind that a neighbor of Talleyrand's, at table, asked him what he thought of it. "With his unmoved, immovable face he answered only, 'C'est bien remarquable.'" There would be a great deal to quote, if we had space, upon the Duke of Wellington, as to whom the author seems divided between a sense of his great soldiership and a sense of his incompetency as a political leader. He is equally sorry to forget the one and to shut his eyes to the other. Everything that he says about the Duke of Wellington seems to us to indicate in an unusual degree the faculty of discrimination. It is really refined characterization. The same is true of his treatment of Peel. There are a great many very short anecdotes, but even these are too long for us.

"Talleyrand afterwards talked of Madame de Staël and Monti. They met at Madame de Marescalchi's villa, near Bologna, and were profuse of compliments and admiration for each other. Each brought a copy of their respective works, beautifully bound, to present to the other. After a day passed in an interchange of literary flatteries and the most ardent expressions of delight, they separated, but each forgot to carry away the present of the other, and the books remain in Madame de Marescalchi's library to this day."

Of Washington Irving Mr. Greville makes mention which is slightly derogatory; it is a case of "how it strikes a contemporary" when the contemporary is rigidly a man of the world, and of the Old World. "Washington Irving wants sprightliness and more refined manners. . . . Even Irving, who has been so many years here, has a bluntness which is very foreign to the tone of good society." We must make room lastly for this about Monk Lewis:

"He had a long-standing quarrel with Lushington. Having occasion to go to Naples, he wrote beforehand to him to say that their quarrel had better be *suspended*, and he went and lived with him and his sister (Lady L.) in perfect cordiality during his stay. When he departed, he wrote to Lushington that now they could resume their quarrel, and accordingly he did resume it, with rather more *acharnement* than before."

But we must leave our readers to explore at first hand this very considerable contribution to the political and social history of England for the greater part of the present century. Mr. Greville, in quietly making his entries, knew he was doing well, but he has done even better than he suspected. In addition to portraying a society, he has depicted himself; and his figure, in spite of a certain dryness, has a kind of exemplary dignity. It is eminently that of a gentleman. We welcome these volumes as a suggestive reminder that it is, after all, possible to be concerned with public affairs and to preserve the tone belonging to this character.

## THE COMTE DE PARIS'S HISTORY OF THE REBELLION.*

JUDGING from the two volumes already published, the Comte de Paris contemplates writing a military history of the war complete in every particular, the smallest skirmish not being omitted. We must not, on account of the author's short service as an aide-de-camp on General McClellan's staff, prejudge this book to be an account of his personal services and a plea for General McClellan. Such is far from being the case. He writes of the entire war, East and West, after years of study on all its details and from every authority available; and General McClellan early comes in for sharp censure for his inaction in October, 1861, when "he lost the best opportunity he ever had for commencing a successful and decisive campaign."

The purely political part of the struggle is mentioned only in a short chapter on slavery and in part of the chapter on the Presidential election. The author's theory of the cause of the war may be briefly summed up—viz., that in the increasing population and prosperity of the North the South feared that it was losing the preponderance in national affairs which it had maintained from the beginning of the War of Independence; that the South was determined on extending slavery into the Territories and newly-formed States, since on slavery depended its own prosperity; and that, failing in this attempt, it intended to regain its influence by conquering a humiliating peace from the North. With the justice or injustice of this view we are not concerned. In comparison with the magnitude of the work, it is not given at great length, but simply from the feeling that some statement of the ultimate causes of the war was necessary. Once fairly entered upon the events of the struggle, however, the political and military history are so intermingled that they cannot be separated; and it is hinted that the fourth volume will be mainly devoted to the subject of emancipation.

This is essentially a military history, although not written for the limited circle of technical military readers. Of the nine volumes to which it will extend, the first two bring us only to the spring of 1862, and end with the battle in Hampton Roads and the embarkation of McClellan's army for the Peninsula. In the first volume the only action described of any consequence is the Battle of Bull Run; but this volume is perhaps the most valuable of all, inasmuch as it contains an elaborate criticism of our system of a small regular army supplemented in time of need by immense numbers of volunteers; and this criticism is from one accustomed all his life to, and thoroughly familiar with, the organization and methods of European armies. He quickly seizes upon the salient military features of the war, which we conceive to be, first, the importance of the railroads, this being the first great war in which they were employed; and, second, the effect of the nature of the country fought over upon the grand tactics necessarily employed. While strategy is a fixed science, unchangeable from its very nature, tactics—the other element of the military art—is constantly changing, both in its minor and grand divisions; and it is notorious that the tactics of the late war were, from the topographical features of its theatre, essentially modified from those of European wars. The author accordingly plunges at once into a long topographical description of the theatre of the war—a broken and wooded country, only about one-eighth part cultivated, sparsely settled, and incapable, as a general rule, of supporting a large army; necessitating the transportation of supplies over a long distance, and confining an army to the neighborhood of a river or a railroad as a base. This leads him to remark that one of Napoleon's most famous maxims—separate to subsist, and concentrate to fight—does not obtain in America:

"Thus, while in countries rich in resources of provisions, like Europe, an army separates to subsist and concentrates to fight, we see that in America the larger an army, the more it must concentrate to subsist; for, obtaining almost nothing from the country it occupies, the more it deploys, the greater the difficulty of supplying the corps distant from the route which alone supplies it."

In connection with this subject of supply, the vast and intricate river-systems of the Southern States are fully explained; and how they in turn gave rise to the combined land and naval expeditions, which the author regards "as giving to this war its distinctive character among all modern wars."

The history of the Regular Army is carefully and accurately presented. Beginning with a description of the course of study at West Point, the army is followed through the war of 1812—"which only developed the fact, which has been so many times since confirmed, that on the soil of America the defensive is easy, the offensive difficult, to sustain"—through the swamps of Florida, the war with Mexico, and the dreary service on the Plains. Of the army in Mexico the author says:

"But this little band, composed of the *élite* of the American forces, had acquired, with a feeling of pride in its achievements, an experience of war by which the whole regular army profited, and which was not lost for the great struggle of 1861. It was in the young generation which learned its trade so well under Gen. Scott that Federals and Confederates sought the chiefs to whom they confided the direction of their armies." . . . Gen. Scott "had invigorated the regular army, had given it traditions, and had, above all, inspired it with confidence in itself. Thus, knowing how to make himself beloved as well as obeyed, he was thenceforth regarded as the father of the family of officers formed in his school."

* 'Histoire de la Guerre Civile en Amérique. Par M. le Comte de Paris.' Tomes I. et II. Paris: Michel Lévy frères; New York: F. W. Christern.

But it was not West Point and the Regular Army alone who were to fight the civil war. They were to furnish the successful leaders on both sides, but the 2,700,000 men who were enrolled from first to last were to come from civil life: all professions and all trades, rich merchants and planters, small farmers and "poor whites," high-born, delicately-reared gentlemen and newly-arrived, ignorant emigrants, and the scum of cities—the whole male population, in short, both North and South, was to be represented in that motley, undisciplined, but determined assemblage of men which began gathering on both sides of the Potomac in May, 1861. Of what men these bodies were constituted; how the regiments were raised in the various States, and then turned over to the General Government; how they were provided with commanders, brigaded and divisioned, drilled and commanded; how order was gradually brought out of chaos; and how, before this was accomplished, but in obedience to public opinion, the first rude trial of arms was had at Bull Run, and the magnitude of the struggle began to be appreciated—all this is well told, and with it concludes the first volume.

With the second volume we get fairly into the war, but a dreary account it is at first—of the operations in Missouri, the endless marchings back and forward of Price and Sigel, McCulloch and Hunter, the death of the most valuable officer in the field, General Lyon, the senseless division by Fremont of his army into a dozen detachments, and his dabbling in politics at St. Louis, and finally his relief from command. It is a little enlivened by the appearance of General Grant on the scene, in the slight disaster of Belmont, but on the whole it is tedious reading, and at the end of a long chapter we read with a sigh of relief that

"The rigors of winter came to put an end for some time to military operations. When they recommenced, in 1862, they were undertaken with a more concerted plan (*avec plus d'ensemble*). Those which we have just narrated form a collection of small events which seem to have no connection with one another, and which may have appeared to the reader very long and monotonous. It was necessary, however, to give an account of them to show how the war was carried on in those distant regions—a war which in many ways recalled those of the Middle Ages, where small armies unceasingly advance or retreat before one another, often disappear from sight, meet one day on the field of battle and disperse the next for want of means of subsistence."

Of a similar nature were the action at Ball's Bluff, and the various manœuvres, small combats, and endless marchings and counter-marchings of the detachments, then called armies, in West Virginia, Eastern Kentucky, and Tennessee. In describing all this so minutely, the author undoubtedly lays himself open to the charge of diffuseness. He would probably state in excuse that he is describing the war as it was conducted, and that although these small encounters had no lasting effect on the issue of the war, still he feels obliged to describe them in detail, in order to show the extent to which they were carried before the Northern generals realized their mistake. Mistake it undoubtedly was; instead of uniting their scattered forces and breaking through the extended line of posts held by the Confederates from the Alleghanies to far beyond the Mississippi, the policy was to fly the flag over as many isolated points as possible in the South, and thus to "regain territory." It was not until the fighting qualities of both sides were fully proved in the sanguinary battle of Shiloh that the commanders in the West realized that the rebellion was to be suppressed, not by occupying so many States and Territories, but by actually defeating the Confederates under arms.

However, early in the spring of 1862, while McClellan was bound fast about Washington by the mud of Virginia roads, having lost his opportunity in the mild autumn, some tangible plan seemed about to succeed the aimless wanderings of the Federal forces west of the Alleghanies. Grant, with 15,000 men, was at the junction of the Tennessee and Ohio Rivers, and purposed, with the aid of Foote and his gunboats, to penetrate the Confederacy by the way of the Tennessee and Cumberland Rivers. This plan was at once made feasible by the capture of Forts Henry and Donelson, and their fall necessitated the evacuation of Columbus, Bowling Green, and Nashville, and the taking up of a new Confederate defensive line through Memphis and Chattanooga.

Another proof of a better comprehension of military matters was given in uniting all the forces in the Mississippi Valley under the command of a single officer (Halleck), and in the preparations—tardy as they were—for concentrating these forces. Grant had advanced his army, now 30,000 strong, to Pittsburg Landing early in March, and was there leisurely maturing his plans—under Halleck—for a further advance, when he was suddenly attacked by 40,000 men under Johnston and Beauregard; and the first really hard-fought battle of the war took place about the little church at Shiloh, on the 6th and 7th of April. The story of this battle is so well told, and the criticisms on the want of vigilance of the Federal generals are so just, that while referring our readers to the book itself, we will translate a few of the reflections of the author at the close of his narrative of the battle:

"The Federals had been taught a great and salutary lesson which could not be lost on men of the stamp of Grant and Sherman. Henceforth, officers and soldiers felt the necessity of constant vigilance; for they were all learning their trade in this grand and rude school." . . . "It was, in fact, from the date of this battle that the two armies learned to know and respect each other. Taught by this experience, their generals comprehended that so long as such armies should keep the field, the struggle between the North and the South would not be terminated. Heretofore their object had been, on either side, to take or to defend positions, rivers, territories. Beauregard, in the East, had only thought of defending Manassas. In the West, everything had been sacrificed by the Confederates to preserve the numerous fortifications on which, as they imagined, depended the possession of the Central States; Mill Springs, Bowling Green, Donelson, Fort Henry, Columbus, and Island No. 10; all the efforts of the Federals had only for their object to wrest from them these positions, these rivers, these territories. Johnston and Beauregard, whatever may be the share of each in this new conception, put in practice at Shiloh a new plan, and endeavored solely to destroy the hostile army. If this plan, well conceived, had not been baffled by the arrival of Buell, the results of their victory would have demonstrated the accuracy of their reasoning. Grant, left to his own forces on the 7th, would have been overwhelmed. Van Dorn, arriving a few days later, would have enabled the Confederate army to make Buell pay dear for his adventurous march from Nashville to Savannah. The invading armies once dispersed, ten new works, as strong as Donelson or Columbus, would have been erected on the rivers, would have closed their course to the Federal gunboats; the positions conquered by the North with so much effort would have fallen of themselves, and the war been carried back to the banks of the Ohio and Missouri.

"In those hours of anxiety in which he saw his army driven back to the river which was about to swallow it up, Grant no doubt made all these reflections, and from that time he did not cease to repeat that the principal objective of the war should be the destruction of the hostile armies rather than the conquest of such or such portion of the territory." . . .

But little more is told in this volume of the land operations. The beginning of McClellan's difficulties and disputes with the Administration is indeed foreshadowed, but it would be useless to comment on this until we have the whole account of the Peninsular campaign. The rest of the volume is devoted to the earliest of the combined land and naval expeditions, the movements of Admiral Foote's fleet in the West, the Roanoke expedition, and the purely naval combat in Hampton Roads. With the account of this last momentous engagement—the first in the world's history between armored ships—the second volume closes. If those which are to succeed it are composed in the same clear and comprehensive manner, we shall undoubtedly have the best history yet written of the military operations of the war. The list of kindred works is still meagre. Besides the official reports of both sides, which are often contradictory, and, in the case of the South, difficult of access, we have on that side the several books on the 'Lost Cause' by the late Mr. Pollard, General Johnston's narrative, and various minor biographies, none of which pretend to the rank of final history. On the Northern side by far the best accounts, in spite of their somewhat theatrical style, are those of Swinton in his 'Campaigns of the Army of the Potomac' and 'The Twelve Decisive Battles of the War.' In addition to these we have Badeau's 'Life of Grant,' not yet completed; De Trobriand's 'Four Years in the Army of the Potomac;' Headley's 'Sherman and His Generals,' and many more of the same class—not a very valuable one. Greeley's and Draper's histories of the war are political rather than military. From England we have had Colonel Fletcher's 'History of the American War,' some theoretical discussions of the campaigns in Colonel Hamley's 'Operations of War,' the 'Campaigns in Virginia and Maryland,' and some excellent biographical essays by Colonel Chesney. Far above all these in pretension, and so far in accomplishment, stands the work of the Comte de Paris, the first attempt at a full and connected military history of the whole war. The letterpress, as might be expected from Lévy, is excellent; and the maps and plans of battle-fields, taken from those of the Coast Survey and War Department, and handsomely lithographed, leave nothing to be desired.

---

*Life and Literature in the Fatherland.* By John F. Hurst. (New York: Scribner, Armstrong & Co. 1875.)—The present widespread interest in everything relating to Germany may secure a sale for this book, but the dead level of monotony in its style will weary out even the most phlegmatic readers before they are half through its pages. In reality, it contains little of interest about either life or literature in Germany, but is mainly an ill-arranged medley of dull journals of travel, trite information about the late Franco-German war, eulogies of a few theological professors, and visits to great pub-

lishing houses. In fact, the space given in a volume of such title to the subject of the mere manufacture of books as articles of trade, is a fair commentary on the strangely external point of view from which everything is regarded. We are conducted, for example, by Dr. Hurst to Heidelberg University. From all he tells us of it, one would suppose it to be little more than a divinity school in a decaying state. There is a cry of "Ichabod, Ichabod," over the falling away from the old standards of theological belief, and much space is devoted to one Schenkel, who is pronounced the most complete "charlatan" in Germany. But of the powerful men who are drawing round them crowds of eager students and making a mark on the thought of the age—of Bunsen, perhaps the greatest of living chemical discoverers; of Kirchhoff, the companion of Bunsen in working out the discovery of spectrum analysis; of Von Treitschke, with his throng of hearers hanging on his superb criticisms of the great poets and statesmen of the Fatherland, or his masterly historical discussions of the political problems of Prussia, Italy, and France; of Zeller in philosophy, and Bluntschli in the law of nations—though they were all at work when our author was in Heidelberg, there is no mention. The living powers in life and literature are passed over in comparative silence—one would surmise, not known to exist. From university to university our author goes his round, lantern in hand, in search of old-fashioned theologians. When he finds one he cries Eureka! and great is his joy over his discovery.

Not that there are not some notices of what Dr. Hurst especially styles "literary characters." One long chapter is entirely devoted to four of these, though what principle has guided the selection of names it would be dangerous to wager. Two of them are novelists, Auerbach and Stifter, one is a geographer, Petermann, and the fourth, for all the world, is Carl Vogt, the zoölogist. The helter-skelter manner in which these are huddled together is a fair specimen of the way the whole book is made up. As bare enumerations of the birth, position, and works of the persons in question, the sketches are indeed as readable as we should expect in an encyclopædia. But if we look for any nice or original criticism, anything fresh or characteristic, we shall reckon without our host. Nothing indicates that our author was drawn to them by any vital, personal interest or appreciation of what is peculiar in them. We must make one exception, however. Carl Vogt's "opposition to the Mosaic account of the creation, which is with him almost a monomania," was, ten to one, the undoubted motive for selecting him. It gave our author a chance to introduce two well-worn stories about gorillas and monkeys visiting the professor and thanking him for giving them and the rest of their race their true position before the world. In fact, these trivial stories and the annihilating argument they are supposed to embody furnish the key-note to Dr. Hurst's position towards the intellect of Germany. He has no comprehension of its depth and seriousness. Outside of a narrow, dogmatic circle he is hopelessly baffled and lost. A master in the Israel of science like Haeckel is to him a creature infested with odd whims about atoms and germs, and the power of a silk-worm to grow into a beaver hat. Nor does he, in this book at least, manifest any acquaintance with such real and efficient champions of the spiritualistic side as Hermann Lotze, the younger Fichte, and Carrière.

With these deductions—and they are certainly ample ones in a book entitled 'Life and Literature in the Fatherland'—we would say that there are a good many things of incidental interest scattered through its pages. The account of Charlotte Hildebrand, the sorely-tried woman to whom were addressed Wilhelm von Humboldt's "Letters to a Female Friend," will interest all who are familiar with that beautiful and bracing book. We thoroughly endorse Dr. Hurst's view of the impolicy or worse than impolicy of sending American children, unaccompanied by their parents, to Germany for school education. It is time a blast were blown against this increasing practice. The good schools of Germany are mainly the public ones. Into these, American boys cannot enter until they have attained very considerable proficiency in the language; nor, having entered, can they derive any real benefit from the course of study unless they remain for years. The private schools, which catch the large proportion of foreign boys, are generally wretched. The different nationalities in them herd together and use their own tongue. Little German is learned and much English forgotten or debauched. The land swarms with American boys who can neither write a decent German letter, nor spell as simple an English phrase as "the son of my house" much more correctly than "the Sohn of my Haus." We dissent, however, from Dr. Hurst's view that "in no other land is the relation between teacher and pupil so beautified and sweetened by such a large element of real sympathy and friendship." German teachers almost always impress American boys as harsh and brutal in their manners. In fact, the school-system is Spartan and half military: the pupil must be as much afraid of his master as the private soldier of his officer. Many of the good results of German education grow out of this, as like ones grew out of the old English custom of flogging the Latin grammar into the boys. We would forewarn even young ladies thinking of going out to study music in the conservatories of Leipzig and Stuttgart to be prepared for many a cry over what they will stigmatize as brutal treatment, and to expect to have their notes thrown furiously across the room by the exasperated professor, or to be informed by him that he could get upon the key-board and play the piece better with his boots. But they will learn ten times more from "the bear" than from one who would let them have their own sweet, foolish will.

---

*Remains of Lost Empires:* Sketches of the Ruins of Palmyra, Nineveh, Babylon, and Persepolis, etc. By P. V. N. Myers, A.M. (New York: Harper & Bros. 1875.)—This stout and handsome volume (it is beautifully printed) is a decidedly disappointing record of an extremely interesting journey. Mr. Myers's opportunities were excellent, and his scientific equipment, especially in the matter of geology, seems to have been very sufficient; but he possesses the art neither of minute observation nor of graphic description, and he has the misfortune to write a style recalling in equal measure that of the newspaper reporter and the pietistic "tract." There is something really irritating in seeing a traveller with Mr. Myers's apparent energy in locomotion wear such very dim spectacles as those he generally brings to bear on people and manners. "A few hours from Birijic we met a party of four or five horsemen breaking along the rocks at a reckless speed. They proved to be the post with the Aleppo mail. This was the first thing like a hurry we had seen in Syria. It was really refreshing to see something moving lively in such a stupidly slow country." The writer of these lines seems to us here, besides giving the key to his style, to betray that he is not a sympathetic observer. He is himself in too great a hurry, and though he gives careful descriptions of the ruins and the topography of the several great extinct cities he visited, he has little sense of detail and but a rough way of relating things. That portion of his journey which he here narrates was begun at Damascus, from which city (with his brother, who was his companion throughout, and whose early death he commemorates in his preface) he proceeded on a five days' excursion across the desert to Palmyra. He reproduces, in a degree, the impressiveness of those mighty colonnades, gazing in silence at their sandy horizon, and makes us feel that, if they point to a nearer and less mysterious past than Nineveh and Babylon, their immense desolation is perhaps only more tragical. Palmyra rose and fell under the Roman Cæsars, and both her rise, while she was tributary, and her fall, when she rebelled, give us the measure of a power in which we are still interested, as the great initiator of our modern world. Mr. Myers explored the ruined cities of Northern Syria, which he found both numerous and interesting, and then made his way across the plains of Mesopotamia to the Tigris, striking it opposite to Nineveh. From Jerusalem to this point he had ridden a thousand miles. As to Nineveh the author is voluminous, and devotes some space to discussing, apropos of a Ninevite tablet inscribed with the Chaldean record of the Deluge, the question of the literal veracity of the Biblical recital of that event. He sides with the Bible, and, being a geologist, is able to affirm that the Chaldean plains are distinctly destitute of such evidence of submersion of the land as to justify the theory that the tradition of the Flood was a myth resting on a mere local inundation.

Mr. Myers hired a raft at Mosul and floated down the Tigris to Bagdad, "the only living city of any note in a region filled with the entombed cities of dead monarchies." His account of navigation on the great Assyrian stream is entertaining—especially the story of a prolonged hurricane, during which the raft took, as it were, the bit between her teeth and rushed along for a night at her own discretion. In the chapter on Bagdad the reader finds himself regretting the author's dry, common manner, and wishing that his touch were more pictorial. His fortune widens as he goes. He gives a copious account of the ruins of Babylon, from which it appears that he accepts the Tower of Babel as an historical fact, and is inclined to believe in its identity with the great mound, now invisible, known as Birs Nimrod. But he draws the line of acceptance at the confusion of tongues, and quotes from a "fugitive article" by the "Rev. E. P. Powell" in support of this attitude. After this Mr. Myers's journey became magnificent. Down the Tigris again, into the Persian Gulf, and across the Gulf in time to catch, at Bushire, a caravan which led him across Persia—past more ruined cities and through picturesque mountain passes, among traces, still vivid, of the late horrible famine, to Shiraz and Persepolis. The very names here seem full of the stuff that delightful books of travel are made of; but Mr. Myers continues rather tame, and has little else for the poor Persian civilization but cursory

contempt, which, though doubtless in a sense rational enough, is not what the reader bargains for in the way of entertainment. But archæology enlivens our author, and he gives an interesting report of the magnificent ruins of Persepolis, where he found "Stanley, *New York Herald*, engraved between the eyes of one of the colossal bulls, in letters as bold as the Ujiji expedition." Remote posterity, Mr. Myers remarks, will have "a real time" discussing, amid this conflict of evidence, just who it was that set up these bulls. The last part of the volume is devoted to the narration of a rapid run from Bombay up into the Himalayas and the Vale of Cashmere, where it was the author's purpose to spend a portion of the summer.

The work is readable, thanks to the subject; but we think that we do not misrepresent it in saying that it makes the more enquiring reader wish very frequently that *he* might have had half the author's chance. The illustrations are poor, and in place of them we should have preferred a map with the indication of Mr. Myers's course.

*HENRY HOLT & CO.'S SCHOOL-BOOKS*

include among others, Freeman's Historical Course, the Class-room Taine, Siglar's English Exercises, the Ord. Series of Classics, Whitney's German Course, Otto's French and German Courses, etc. Reference is made to the faculties of all leading institutions. Catalogues sent on application. Address

CINCINNATI AND NEW YORK.

NEW BOOKS.

*ECLECTIC HISTORICAL ATLAS.* Full 8vo, cloth, 18 double-page Maps, accurately drawn and engraved. A hand-book for general readers and students in Ancient, Mediæval, and Modern History. $1 50.

*DRAMAS AND DRAMATIC* Scenes. Edited by W. H. Venable, author of 'School Stage,' 'Amateur Actor,' 'U. S. History.' 20 plays selected from the writings of Standard Authors. Illustrations by Farny. 12mo, cloth, 336 pages, $1 50.

*ELEMENTS OF PHYSICS.* For Academies and Common Schools. By S. A. Norton, A.M., Professor in Ohio Agricultural and Mechanical College, and author of 'Elements of Natural Philosophy.' 12mo, 286 pp., $1 15. Supplies for first introduction into schools, and single sample copies for examination with a view to introduction, 84 cents per copy.

*PESTALOZZI, HIS LIFE, WORK,* and Influence. By Herman Krüsi, A.M., Instructor in Philosophy of Education at the Oswego Normal and Training School. Cloth, 8vo, 248 pp., Portraits and Illustrations, $2 25.

WILSON, HINKLE & CO., PUBLISHERS,
Cincinnati and New York.

*ENCYCLOPÆDIA BRITANNICA.*

NINTH EDITION.

Vol. I. of the Ninth Edition of the 'Encyclopædia Britannica' will be issued during January, 1875, and the other volumes will follow, twenty-one in all, at the rate of three per year. More than one-half of the matter in this edition is new, and comprises special contributions by many of the most eminent writers of the day, including Prof. Huxley, Max Müller, A. R. Wallace, R. A. Proctor, and St. George Mivart. The volumes will be illustrated, and in typographic excellence will be unsurpassed.

This edition will embody the results of the ripest learning of the nineteenth century, in Art, Literature, Philosophy, and Science.

Price of the volumes, $9 each.

JUST PUBLISHED.

*A HUNDRED MINISTERS,* and How they Switched Off. Some account of the lights and shadows of ministerial life. 1 vol. 16mo, cloth, $1 50.

An examination of the alleged

*DISCREPANCIES OF THE BIBLE.* By John W. Haley, M.A., with an Introduction by Alvah Hovey, D.D., Professor in the Newton Theological Institution. 1 vol. crown 8vo, cloth, $2 25.

☞ The above, or any book published in the United States, sent, post-paid, on receipt of price by

ESTES & LAURIAT,
143 Washington Street, opposite Old South, Boston.

*HARPER'S CATALOGUE.* The attention of those designing to form libraries, or increase their Literary Collections, is respectfully invited to Harper's Catalogue, which comprises a large proportion of the standard and most esteemed works in English Literature—*comprehending over three thousand volumes.*

Librarians who may not have access to a trustworthy guide in forming the true estimate of literary productions, will find this Catalogue especially valuable for reference.

The Catalogue is arranged alphabetically by the authors' names, anonymous works by their titles. The index is arranged by the titles of the books, besides having numerous appropriate heads, each general head being followed by the titles of all works on that subject.

Harper's Catalogue sent by mail on receipt of ten cents.
Address HARPER & BROTHERS,
Franklin Square, New York.

*This work was published anonymously. Its authorship is now acknowledged by*

DR. JOSEPH PARKER,

Author of 'Ecce Deus,' etc.

THE PARACLETE.

*An Essay on the Personality and Ministry of the Holy Ghost, with some References to Current Discussions.*

*One vol.* 12mo, $2 00.

*From the New Englander.*

"The author of this treatise has appreciated its importance, and has asserted this in utterances of no little fervor and power. . . . The volume is instinct with electrical power, and abounds in passages of glowing eloquence. . . . Preachers will find the volume eminently quickening and useful."

*From the Church Journal.*

"It is written in a warm, devout, earnest manner, with much power of reasoning and wealth of illustration and very much suggestiveness, as though the author was rather burdened with the amount he had to say, and used necessary repression. The introduction and the essays, reviewing Mr. Huxley, at the end, are perhaps the best parts of the book."

*NEW YORK, THURSDAY, FEBRUARY 4, 1875.*

## The Week.

CONGRESS has passed the bill providing for the payment of the interest on the 3-65 bonds of the District of Columbia; beyond this the time of the Senate has been occupied with a continuance of the debate on Louisiana affairs, and that of the House with the struggle of the Republicans to get control of legislation and cut off debate for the remainder of the session. The fight began last Wednesday, and took the form of an attempt on the part of the Republicans to get the Civil Rights Bill before the House. After the reading of the journal, and some routine business, General Butler called up a motion made by him in the last session to reconsider the vote recommitting the House Civil Rights Bill to the Judiciary Committee—a privileged motion, which could be called up at any time. Mr. Randall of Pennsylvania, who played the part of leader of the Democrats during the greater part of the contest which followed, and who seems to have done it very well, interposed a motion to adjourn, which was supplemented by another Democratic motion, that when the House adjourn it should adjourn till Friday. These two motions, varied by a motion to adjourn till Saturday, were the only questions on which the House had an opportunity to act during the long session which followed, the yeas and nays being insisted on by the minority, and the length of the time for taking a yea-and-nay vote depending on the rapidity of the Clerk's enunciation in calling the roll; and the Clerk, according to the reports, read the names with deliberation.

---

When these proceedings had been going on for some four hours, General Butler proposed a compromise, to the effect that if the Democrats would consent to the consideration of the bill, the Republicans would permit "all proper opportunity for debate" and "all proper germane amendments." Mr. Randall replied with a counter-proposition that the House should proceed with the regular Appropriation Bills, and that the Civil-Rights Bill should be postponed till the necessary means of carrying on the Government should be provided for, and an extra session thus avoided. To this General Butler replied that Mr. Randall was not a member of the Committee on Appropriations, and also that the majority could not permit the minority to dictate to them what legislation should be taken up. The negotiations were here broken off, and the dilatory motions went on, the roll being called seventy-five times, until, after forty-six hours' continuous session, the Republicans abandoned their attempt for the time, and the House adjourned at half-past ten on Friday morning. During these proceedings the Speaker, Mr. Blaine, appears to have behaved with great fairness, refusing to entertain any of the irregular motions made by the Republicans for the purpose of breaking up the "dead-lock," notwithstanding that great pressure was brought to bear on him. During the long fight the House was in a good-humored state, and, when the adjournment was finally carried, Mr. Randall left the House with a bouquet in one hand, a teapot in the other, and a canister of tea under his arm; the beverage used by the Democratic chieftains pointing, it is supposed, to the improved moral tone of the party, of which we see so many proofs on all sides.

---

Saturday was entirely occupied with a reading of the journal of Wednesday (Wednesday having, for parliamentary purposes, lasted till Friday), the clerk being obliged by the Democrats to read the details of all the filibustering votes. Mr. Butler made an earnest appeal to the Speaker to permit the Republicans to introduce motions which would give them a permanent advantage over the Democrats. This Mr. Blaine declined to do on the ground that it would be a revolutionary and fraudulent proceeding, to which Mr. Butler is said to have replied with profanity that he did not care if it was, and also to have accused Mr. Blaine of leaving him off the Reconstruction Committee. Mr. Blaine replied that this was untrue, as he had been offered a place and declined it, and that Mr. Butler knew it to be untrue—which seems under the circumstances highly probable. After listening to the journal for some time the House adjourned till Monday, when Mr. Hale, of Maine, on the call of the roll of States for bills, introduced a resolution, in accordance with a plan devised by the Committee on Rules, for the amendment of the rules, to cut off dilatory motions, and this was referred to the Committee. Mr. Randall appealed from the decision of the chair admitting this and another resolution of the same sort introduced by Mr. Cessna, but was overruled by Mr. Blaine, and on an appeal to the House the Chair was sustained by a strict party vote. Mr. Cessna's resolution was referred. Beyond this nothing of importance was done—two resolutions introduced by Mr. Butler failing to receive the two-thirds vote necessary to carry them—and the House at six o'clock took a recess till Tuesday, when the session of Monday began again, and ended in the complete discomfiture of Butler, Cessna, and the other Republican extremists, though the rule adopted (by a two-thirds vote) is of course not satisfactory to the minority. Under it dilatory resolutions are out of order when a question is pending, except one to adjourn, and one to adjourn to a day fixed; but the previous question on the third reading of a bill cannot be ordered on the first day of its consideration except by a two-thirds vote. This rule applies to the appropriation bills, but not to other money bills.

---

The melancholy news arrived from Washington a week or two ago that "Old Bill King had been smoked out at last," meaning that it had been proved that Mr. William King, some time postmaster of the House of Representatives, and now member-elect of the Forty-fourth Congress from Minnesota, had received a very large amount of the Pacific Mail corruption fund. Since this unpleasant revelation he has carefully secreted himself, and refuses to be discovered by the sergeant-at-arms or by any one else not selected by himself. But now comes the House of Representatives of Minnesota and passes a preamble and resolutions declaring that "the proceedings now pending in Washington point to the Hon. William King" as having received some of the money above-mentioned, and that "the people feel that his usefulness will be greatly impaired, and dishonor cast upon the escutcheon of Minnesota, unless he at once rectifies his position," and demanding that he either appear before the committee at Washington at once or resign his seat in the next Congress. Every patriot must approve cordially of this address to the Honorable William; but we, as "men of the world," advise him to pay no attention to it, but stay where he is. When King's own "escutcheon" is in such a bad condition, it is absurd to ask him to trouble himself about "the escutcheon of the State of Minnesota," and as to his "usefulness," we feel sure that he will agree with us in thinking that a little impairing will not do it any harm. He will, therefore, if counselled by us, let the proceedings at Washington "point" at him as long as they please, and remain in retirement until they blow over. Several statesmen have been in as bad a plight as he during the last few years, and have come out all right by taking no notice of their enemies. We should, were we in his place, occupy ourselves during this period of enforced leisure with the preparation of a list of murders committed since 1868 in the States of Louisiana, Mississippi, Arkansas, and Alabama, and then, when any one asked us on issuing forth what we had done with the Pacific Mail money, we should show him the list, and, looking him straight in the eye, ask him whether that wasn't a pretty record, and whether he meant to maintain that it wasn't the

duty of the National Government to "protect" the citizen of the United States wherever found, in New Orleans as much as in Berlin or Yokohama? If "Old Bill" will try this, we feel sure he will save himself much annoyance.

---

The most interesting and curious part of the testimony taken by the Alabama Investigating Committee relates to outrages perpetrated by the colored population, or the Republicans, upon Democrats. For instance, Robert Bennett, a negro, testified that he had been turned out of a church, of which he was trustee and steward, for voting the Democratic ticket, and H. A. Campbell, another Democratic negro, swore that in Bullock County "the Democrats were not allowed to speak at the public meetings"; that the Republicans broke up a Democratic meeting in that county about the 29th of September; that on another occasion the witness and another man who intended to speak "were shot at twice"; while in Chambers County the colored men formed a society to prevent colored women from marrying Democrats, and to advise the separation of husband and wife where the husband was a Democrat, and to exclude Democratic negroes from all society. A similar organization existed in Lee County; the members of that society had a pledge that a woman would leave her husband if he was a Democrat, or a young woman would not marry a man if he was a Democrat. In Montgomery County a preacher of the Methodist Episcopal Church deprived the Secretary of the salary of his office because he was a Democrat, and stopped another man from being a deacon of the church for the same cause.

---

The truth of this testimony we do not vouch for, but it is certainly quite as good as the tales of outrages related by Mr. Charles Hays of the same State; and the production of this kind of testimony on the Democratic side in a State like Alabama (and the Louisiana Sub-Committee reported evidence of the same sort) shows very clearly that the taking of testimony by Congressional committees *ad infinitum* will not make the situation any clearer than it is now. Suppose it is proved to the satisfaction of everybody that in some of the Southern States the whites wherever they are strong enough threaten the negroes, and that the negroes where they are strong enough, with the aid of United States troops, ostracize men of their own color who show an inclination to desert "Massa Grant" or the local leader who stands in his place—does this show that the presence of the troops and the enforcement of Ku-klux Acts do any good? The mass of the testimony taken in Alabama seems to show a disorderly state of society; but we knew before that any one of the Southern States in which troops were keeping the peace, and the legal status of which the Attorney-General was engaged in solving, was apt to be in a disordered state. The only Southern communities in which perfect peace and order reign are those like Virginia and Georgia, over which the whites have complete control, and with which the troops do not interfere. It is only in the States which the negroes are actually governing, and in which they have the whole force of the United States behind them, that the whites give complete rein to their love of murder and intimidation.

---

To show that intimidation can be used as well by one side as the other, we must call attention to the fact that Frederick Douglass and a large number of prominent negroes in Washington, including P. B. S. Pinchback, "senator-elect," as he is called, have held a meeting and resolved on a war of races, to begin as soon as possible after the adjournment of Congress—unless meanwhile the Supplementary Civil-Rights Bill, and other measures which they like, are passed. They begin by reciting in the usual manner the terrible "lawlessness existing in the Southern States," "jeopardizing lives and property," and declaring very justly that this state of anarchy "demands an expression of sentiment from all friends of law, justice, and humanity," particularly the colored race; and they thereupon declare that, if this sort of thing continues, it requires "no unusual foresight to see" that the negroes will be forced either into "neutrality" between Republicans and Democrats, or into an alliance with the latter; or "there is still one other alternative to which we are exposed—one which is truly fearful to contemplate." "Human nature is the same everywhere. There are many varieties of men, but only one human nature; and it is possible that, stung to madness and desperation by continued and unceasing outrages, and seeing no means of escape, a spirit of retaliation and revenge may be aroused which will fill the South with scenes of rapine, blood, and fire." From this it may be inferred that our country has a pretty dark future before her. If the Republicans in the South are elected to office, the White League will rise and destroy them; if the Democrats carry the day, the troops must interfere and bring in rapine and blood to restore the Republicans; while if Judge Hoar should forget that Mr. Sumner on his death-bed entrusted him with his Supplementary Civil-Rights Bill, then the negroes will lay waste the South. It has a horrible look on every side.

---

Mr. Morton's constitutional amendment for the election of President by a direct vote provides, first, that each State shall be divided into a number of districts, equal to the number of representatives the State is entitled to in Congress, to be composed of "contiguous territory," and to be as nearly equal in population as may be, and that the person having the highest number of votes in any district shall receive the vote of that district, which shall count as one Presidential vote; second, that the person having the highest number of votes in any State shall receive two Presidential votes from the State "at large"; third, that the person having the highest number of Presidential votes in the United States shall be President. This amendment would, if adopted, make important changes; it would sweep away the electoral college, while it would at the same time retain the feature of the present system which has really caused most of the discontent with the electoral college—the possibility of the election of a President by a numerical minority of the whole people. At present this possibility arises from the fact that the votes are cast by States, and not by the people; but Mr. Morton's amendment specially retains this possibility, by making the person receiving the highest number of presidential votes President. It is a noticeable fact that Mr. Morton, in his argument on introducing the bill in the Senate, objected chiefly to the present system as leaving the door open to fraud. Under the present system the votes of the electoral college are sent under seal to the President of the Senate, who, in the presence of the Senate and the House of Representatives, counts them. As the President of the Senate is the Vice-President of the United States, and therefore a prominent man, he is quite likely to be himself a candidate for the Presidency (this has happened, Mr. Morton says, six times), and he would therefore, under these circumstances, be under a strong temptation to "count himself in."

---

This argument is, however, fallacious. If no one in the country knew till the count at Washington the real result of the election, it might be true that the counting officer would be under this temptation, but as, under the present system, every one in the country, from one end to the other, knows long before the formal count how the election has gone—has seen it in the newspapers, read it on the bulletins, and congratulated or condoled with every one else over the result, it seems impossible that any Vice-President should try the scheme Mr. Morton suggests. Besides this, there is no way of escaping the possibility of fraud somewhere. If we remember right, Henry Clay considered that the election of Polk was invalidated by frauds in New York and Louisiana, and it is quite evident that at a very early stage of the election there is at least quite as much opportunity for fraud as at the end. Cases arising out of the war and reconstruction—questions, that is, of States being in or out of the Union—cannot be provided for in advance, for the Constitution is an instrument which assumes every State to be in the Union, and all its provisions assume the condition of peace. Again, Mr. Morton's amendment

provides no tribunal for the settlement of contested election cases; but, as an indication of what the amendment might lead to, it may be mentioned that he stated to the Senate that some of the Committee thought these cases ought to go to the Supreme Court at Washington—an admirable plan for ruining the independence of the judiciary, and good for nothing else that we can see. Mr. Thurman of Ohio, who understands these questions much better than Mr. Morton, objects very strongly to this omission, and he is quite right. We mention these objections as they occur to us, without meaning to express any opinion on the general merits of the question.

The Tilton-Beecher trial has been saved from miscarriage during the week by the admission of Tilton's evidence, under restrictions as to confidential communications from his wife. The success of Beecher's counsel in shutting him out might have been a very important thing for the marriage relation, as Mr. Evarts so ably tried to show, but it would have been a very fatal thing for Mr. Beecher's cause. To come down to hard facts—when a man accuses a minister of seducing his wife, and they both agree to go into court and have the matter investigated, it will not do for the minister to ask to have his accuser's mouth closed on grounds of public policy and for the strengthening of the matrimonial bond. We presume that the motive actuating Mr. Beecher's counsel was the unfairness of hearing Tilton when Mrs. Tilton is excluded; but this might have been met by an argument showing Tilton's legal ineligibility, if ineligible he is, followed by an offer to let him in if he would let his wife come in too. The public still continues to be troubled by the demeanor in court of the parties to the controversy. They seem to consider it a light, joyous affair, like a charade, when the rest of the world considers it a serious, horrible affair, like a tragedy. When Plymouth Church, too, filled the court-room with bouquets for some days at the beginning, the odor of them sickened the rest of the community. "Floral tributes," as they are called in the Brooklyn dialect, seemed, in such a place, on such an occasion, like wreaths round the man-hole of a sewer.

The debate in the French Assembly during the week on the Constitutional bills has apparently had some important results. The Right has opposed these bills from the beginning, and stood for the monarchy pure and simple. The Left, on the other hand, has been struggling to insert in them some recognition of the Republic. Accordingly, on Thursday last, the Right moved the withdrawal of all the Constitutional bills before the Chamber; this was defeated. M. Laboulaye then moved, as an amendment to the Ventavon bill, that the Government be composed of a Senate, a Chamber of Deputies, and a "President of the Republic," which, apparently to the surprise of the Assembly, was opposed by Louis Blanc, who wanted no President at all, and thought that if there had been none in 1851 there would have been no *coup d'état*. M. Laboulaye's motion, however, was defeated, and M. Wallon, a Bonapartist, moved as an amendment that the organization of the Government be completed without the formal proclamation of the Republic, which was carried Saturday by 353 to 352. The amendment, if correctly reproduced by the telegraph, reads: "The President of the Republic shall be elected by a majority of the Senate and Chamber of Deputies in congress assembled; the presidential term shall be seven years, and the President can be re-elected." On Tuesday, the same member's amendment, authorizing the President to dissolve the Chamber of Deputies with the advice and consent of the Senate, was adopted by a decisive majority of 200. The Government, therefore, promises to be a kind of cross between a constitutional monarchy and presidential republic. It will differ from the presidential system in making the ministry responsible to the Chambers, and in giving the Executive the power of dissolution; and from a monarchy in giving the power of electing the chief executive officer to the Chambers, and fixing his term of office. But it is safe to predict that the re-eligibility of the President will amount in practice, in a country situated as France is, to life-tenure, or something very like it. The President will have the command of a very large army and an enormous power of "intimidation"; he will, too, be surrounded by the prestige and traditions of an absolute monarchy, in a community accustomed to rely on the one-man power and haunted by the fear of internecine war. Under these circumstances, an opposition candidate would wear the appearance of a revolutionist, and would hardly venture to show himself.

Alfonso has begun his reign by taking the field against the Carlists, who are apparently somewhat distrustful of themselves, and are retiring before the royal forces, making the relief of Pampeluna tolerably certain. He has also issued a proclamation, addressed to the Basques, in which he assures them that their old liberties will not be meddled with, and that he is as zealous a friend of the Catholic faith as they are. In the meantime, however, the Protestants in Spain have begun to be a good deal alarmed. They have now churches in all the large towns, with schools annexed; and if the Constitution of 1869 is to be considered abrogated, these have no legal protection, and will be closed. As a matter of fact, two Protestant churches have been closed in Madrid, and two Protestant newspapers suspended—though it is alleged that the papers have been suspended rather as republican than as Protestant. There are, however, many signs that the new monarchy means to conciliate the Church. The Minister of Grace and Justice has issued a circular, addressed to the bishops and clergy, congratulating them on the revolution, and promising them that the relations of the new régime with the Church will be effected "with the counsel of wise prelates and by accord with the Holy See," and everybody knows what this means. This may be simply an attempt to take the wind out of the sails of the Carlists, and Don Carlos does denounce it as a hypocritical display of piety; but the clergy are too shrewd not to take it for what it seems. Bismarck, in the meantime, announces that he will not recognize the new Government as long as the rights of Protestants are interfered with—which is, perhaps, hardly defensible under international usage; but the question, we think, may fairly be called ripe, whether a government which denies the right of public worship to an orderly, Christian denomination is entitled, as of right, to recognition as a member of the community of civilized states. If Alfonso was to amuse himself with burning heretics, he would only do what nobody thought of denying his right to do a century and a half ago; but, if he did it now, no civilized government, it is safe to say, would hold any intercourse with him. The time comes, now and again, when international usage has to be modified in the interest of civilization, and somebody has to take the first step. Of course, if not taken carefully, the new position cannot be held; but we know of no good reason, of the utilitarian kind, for supposing that Bismarck has made a mistake in this instance, or cannot hold his ground.

Poor Señor Castelar has been "interviewed" by a newspaper correspondent in Switzerland, to which country he has retired. He is disgusted with the Spaniards, and says he has been mistaken in them. He now considers them a "Semitic people, full of Moorish blood," who cannot understand Western politics, and says that the present reaction is "an Arab reaction." Nothing is more pitiable than the awakening of a Sentimentalist from his dreams; but then, he ought not to invent fantastic explanations of them. The Spaniards are no more "Arabs" than Señor Castelar himself, and are acting no more recklessly and thoughtlessly now than he was when he was setting up his Federal Republic and dissolving the army. His follies and theirs are easily explicable by reference to known facts of European history, and without going to Bagdad or Alexandria. Señor Castelar has reached his sixteenth paper in *Harper's Monthly* on "The Republican Movement in Europe." From such cursory examination as we have been able to give these treatises, we are unable to see any reason why he should not carry them on as long as he lives. In the regions to which his speculations carry him, time and space are the only phenomena.

## SOUTHERN SOCIETY.

THE President's admission in his recent message that the only objection he had to the mode of dealing with Southern disorders recommended by General Sheridan was its illegality—or, in other words, that he thought Radetzki's or Haynau's method of treating turbulence or discontent a good one, which, if the Constitution did not stand in its way, it would be well to adopt in this country—would be hardly worthy of comment if it were simply the opinion of a soldier with little civil training. But so many good men have either accepted it as sound doctrine or passed it over in silence as at most a venial error, even in a man so high placed as the President, that it may not be amiss to remind people once more what a complete departure it contains from the political morality on which this nation has been built up. That the sabre is the worst possible pacificator, and that if men are put under good influences they tend in a state of freedom to social improvement, are the two propositions which lie at the very foundation of the government. If we surrender them, we surrender everything; and, if we refuse to apply them to the Southern problem, we *do* surrender them.

Now, anybody who approached the Southern problem at the close of the war in a right spirit, saw at a glance that the great difficulty of the situation was, first of all, the white man's contempt of the negro, and, secondly, the white man's habits of violence. That the whites did not hate the blacks while the latter were enslaved is very well known; but they did despise them as a degraded race, and often inflicted great suffering on them, such as men inflict too readily on beings of a lower class (such as the brutes) with which they have only imperfect, if any, sympathy. All the writers on slavery before emancipation were, too, agreed that slavery bred in the masters habits of violence by making them imperious, self-willed, and impatient of all restraint or control or opposition, even that of the law. There was probably no trait of the slaveholder's character with which we at the North were made more familiar than this, and none the origin of which was more distinctly traceable to slavery, with its accompanying incident of sparseness of population. If there be at the South at this moment, as we believe there is, only a comparatively feeble respect for human life and for the laws which are intended to protect it, the state of things is exactly what it was before emancipation. Nobody doubts or questions this. In fact, it may be said that, under the influence of these habits of violence, a modification of a curious kind, which has attracted comparatively little attention at the North, took place in Southern criminal jurisprudence long before the war. The common-law doctrine, that malice aforethought makes the killing of a man murder, was not only disregarded by Southern juries, but it became the settled practice to treat it as a justification—that is, the prisoner, far from concealing that the person killed had offended him, and that he owed him a grudge before killing him, made it his principal ground of defence that he had killed him under the influence of resentment inspired by a previous quarrel. This in the Northern States or in England would have ensured his conviction; at the South, it secured his acquittal. The present writer saw in Mississippi, some years before the war, an old gentleman who had, he was informed, killed thirteen men, many of them in cold blood, with impunity. Asking how it was he had escaped, he learnt that there had never been a conviction for murder in that county unless it had been accompanied with robbery, and a few days afterwards he heard a respectable planter say before a large company, in perfect seriousness, and without any sign of disapprobation from the bystanders, that if he were spoken of in a certain way in a stump speech "he would lie in wait for him (the speaker) and kill him," or, in other words, would commit what men in other civilized countries consider the foulest of crimes.

Everybody who has given even moderate attention to human experience in the matter of repressing crime, knows perfectly well that when the manners of a community have got into this condition, change for the better must be the slow work of time, and of a variety of other influences. If any thoughtful man had been asked before the war in what way greater respect for human life could be secured at the South, he would have answered unhesitatingly that slavery must be got rid of, so that the stimulus to violence of temper which the presence of an unprotected class creates might be removed, and that then we must trust to the growth of population and of commerce, and to the influence of education and of the press, to bring home to juries the material advantage of security for the person, and to raise the standard of social morality. If you had asked him whether it could not be done by "troops," he would have laughed at you.

The abolition of slavery has of course removed one bad influence, and has thus in some degree simplified the problem. If emancipation could have been accompanied by complete legal protection for the blacks, supplied by friendly and sympathetic whites—such, for instance, as they receive at the North—it would have simplified it greatly. But to the success of the peculiar mode of protecting them to which we had to resort—the bestowal of the franchise—one condition was absolutely necessary, namely, that no new source of hostility between the two races should be introduced; that is, that the whites should have no fresh reason for disliking them, and that their legal relations should be such as to promote instead of retarding the growth of kindly feeling. If the negroes were allowed to become objects of hostility to the whites, of course nothing was more certain than that the whites would manifest this hostility in the old way, so deeply rooted in their manners, and the way, let us add, in which they would have manifested it towards other whites—that is, by shooting them, or frightening them into emigration. In the old days at the South, when a white man offended his neighbors, they either killed him, or rode him on a rail, or warned him to leave the country "between two days"; there was no earthly reason for expecting that offending negroes would be treated differently. People were or pretended to be shocked the other day because the whites of Vicksburg, when they wished to get rid of the foolish and ignorant negro who had assumed the office of sheriff and refused to file a proper bond, went to his room in a large body (though after having exhausted judicial remedies) and requested him to resign. But this is exactly what they would have done to a white man under similar circumstances. It is the mode of redressing grievances prescribed by immemorial local usage. It is no more a sign of a "rebellious spirit" or of hostility to the Government or the laws, in the sense in which we use these terms at the North, than of a disposition to turn highway robbers.

We do not pretend to say that any such revolution as has been wrought by the war and by emancipation could have been accomplished at the South, no matter how carefully managed, without creating a great deal of bad blood and stimulating in a greater or less degree race-hatred. Nothing that could have been done by any earthly power would have converted the Southern whites suddenly into peaceful, industrious, and patient citizens. Nor could we have prevented, by any care either in administration or legislation, the descent on the South of a flight of Northern demagogues as soon as the negroes obtained the ballot. But the Government at Washington could have exerted a powerful influence in preventing such use of their newly-made power by the blacks as would lead the whites to feel themselves oppressed, and would rouse in them the fierce passions which every man feels at being oppressed by those whom he despises. It could, in short, by either taking charge of the machinery of government at the South itself, or using its influence to throw it into the hands of the more intelligent portion of the community, and prevent its prostitution to the base uses of knaves and adventurers, have so lightened the evil results of the war that the two races might have drifted into amicable relations, and the negroes have learnt their lesson in politics without associating power with plunder and corruption. In so far as there has been violence at the South on the part of the whites towards the blacks, it has unquestionably been simply the Southern mode, learnt long before the rebellion, of redressing grievances, because there has been little of it except where the blacks have possession of the

government—in South Carolina, Mississippi, and Louisiana, for instance, and not in Virginia, or Georgia, or Tennessee. Where we should hold meetings and ask for injunctions, Southern men take shot-guns and begin "intimidating," and they do this in virtue of a habit acquired long before negro suffrage was ever thought of; and the policy of the Republican party ought to have been to prevent in every possible way, by the removal of all stimulus or temptation, the perpetuation of these habits; for, strange as it may seem to many postmasters and custom-house officers, we owe something to the Southern whites as well as to the Southern blacks, not only in spite of our having conquered them, but as a consequence of it. We owe to them as well as to the negroes all the assistance we can give in getting rid of the evil effects of an institution at which we connived, and by which we profited, and in recovering from the effects of a war which was waged, not, as many Congressmen seem to suppose, for anybody's glory or anybody's shame, but in "order to form a more perfect union, establish justice, ensure domestic tranquillity, provide for the common defence, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity."

The whole of the "Enforcement" legislation may indeed be described as an irritant, which, if it were not honestly intended, it would be no exaggeration to call villanous. It would not have been possible for the most ingenious enemy of the blacks to draw up a code better calculated to keep up and fan the spirit of strife and contention between the two races. It is an attempt to supply to the negro, feeble and untrained as he is, by means of legal chicane and military interference, the tranquillity and security which he can only get from his own growth and that of his neighbors in civilization, and from his coming to terms with the people among whom he has to live, and who have the advantage of him in all the arts; and to give him in two or three years blessings which never came to any race, situated as he is, in a hundred years. In fact, it has taken the most gifted races in the world from four to five centuries to traverse the space in social progress through which the Republican party with its frantic law-making has been trying to project the colored man in two Presidential terms. The reports which are now coming in of the condition of the South are simply the proofs which were sure to come sooner or later of the folly of such legislation, and the laborious accounts of "intimidation" and "ostracism" which the Republican party is receiving as precious contributions to its archives, prove the value of the Enforcement Acts very much as the rise in the price of gold proved the value of Thaddeus Stevens's bill for keeping it down. The futility of these Acts may be said to be demonstrated by the fact, to which we have more than once called attention, that no reports of "intimidation" come from the States in which the whites are in a majority and have possession of the government. This crucial fact is carefully overlooked by the Administration press, which continues in the most fatuous way to argue about the South from certain *à priori* notions of its own about the opinions of the blacks and the temper of the whites. If these notions were correct, Virginia, North Carolina, and Georgia ought to be scenes of ruthless violence and anarchy; instead of which, they have, it is safe to say, entered on the path of peaceful, orderly progress, and, with all their drawbacks, are perhaps at this moment the very best political school in which the colored people could find themselves.

## THE ARMY AND THE POLITICIANS.

THE army has been brought into very disagreeable prominence during the late discussions over the troubles in Louisiana, and there has been a good deal of severe newspaper criticism of the conduct of certain officers, which has called forth from the *Army and Navy Journal* the very inadequate reply that the officers of the army are as good men as, or better men than, the editors. We have, as all our military readers know, been the constant defenders and even eulogists of the army, and have never lost an opportunity of enlarging on the value to the nation of a body of public servants who were content to labor for something better than money, who did not measure their devotion by their pay, and who kept alive the traditions of honor and self-respect without which any calling becomes degrading. In fact, the example of the military and naval service of the Government has furnished the most powerful argument in favor of the reform of the civil service, by showing that this reform was an attainable good; and it has done a great deal during these later years to sustain the courage and hopefulness of those who were sickened by the spectacle of political corruption and rascality among civilians. It proved that the right material for faithful and high-minded service in all departments was as plentiful here as elsewhere, and that all we had to do to bring it into use was to create a few by no means difficult conditions. The hostility of the ordinary politician, too, to the army officers, which is one of the few hearty hates which he permits himself, and which does stir his turbid soul to its lowest depths, furnished them, as it seemed to us, an additional claim to public appreciation, for it is the hatred of corruption for purity, of self-seeking for disinterestedness, of ignorance for knowledge, and of trickery and intrigue for faithful and honest service. It has therefore been with deep regret that we have witnessed, what, however, we saw was inevitable, the conversion of the army into gendarmerie at the South, under the operation of the Enforcement Acts. The permission to use the army and navy to protect States against "domestic violence or invasion" has been converted by this legislation into a pretext for turning the troops into ordinary police, commanded by the United States marshal. It appears from the evidence given, both in the Alabama and the Louisiana investigations, that the marshal is apt to prepare for the election by getting out warrants by the hundred and then calling on the troops to execute them. In other words, the troops are called in not to overcome actual resistance to the process of the courts before which the civil officers have retreated, but as the regular and ordinary means of executing them in the first resort; that is, they perform the duties of the French gendarmes and of the Irish constabulary. The objections to this, as far as the public is concerned, we shall not now enumerate. A great deal has been said about it during the past few weeks. The objections to it as regards the army itself are less obvious, but they are also serious.

The legislation under which the Republican party has placed the South is of doubtful constitutionality, has been resorted to largely for party purposes, and is almost sure to be temporary. No thinking man believes that with such proofs of its liability to abuse as are now before us, it will last very long. The reaction against it is already strong, and is running higher every day, and it is exciting a great deal of bitter party feeling. Now, the army cannot help obeying the orders it receives from Washington. For the nature of these orders nobody holds it responsible, and as long as it confines itself to the simple execution of them, officers and men will have the sympathy of all right-minded persons. Soldiers, everybody knows, do not reason on their orders, and it would be very unfortunate if they did. What the friends of the army, ourselves among the number, have been hoping, therefore, is that officers would in the trying circumstances of their situation at the South discharge their plain duties with military discretion and prudence, and so avoid having the service mixed up in what is likely to be the most exciting political controversy we have ever had since the slavery question. It would be difficult to conceive of anything more likely to ruin the army than even the suspicion that it had allied itself with a political party and was acting as its tool or agent. It was therefore with extreme regret that we saw General Sheridan not only undertake the duties of a political tourist in the disturbed districts for the President's private information—though these he could as a military man have fairly discharged by simply reporting what he saw—but also undertake to recommend with great violence of language particular methods of dealing with political troubles. This was the more unfortunate because he had no reputation as a politician or civil administrator to back him up or secure respect for his opinions. He is simply a dashing and success-

ful general of cavalry, who has passed his mature life in the field, and was never thought of by anybody as a person of sound political judgment. Indeed, the selection of him for such an office as he has been filling in Louisiana without the knowledge of his superior officer, General Sherman, was one of the strangest acts of the Administration.

He has been seconded, too, in a curious way by Major Merrill, of the Second Cavalry, whose state of mind is a valuable illustration of the danger of allowing military men to take upon themselves civil functions. This officer is in command of the Shreveport District, and his sole legal duty is to lend the aid of the physical force of the Government to such civil officers as are legally entitled to call for it in the discharge of their duties. It appears, however, from an explanation he has made to the Chicago *Inter-Ocean*, that, on reaching his headquarters, he determined that it was his duty, as military commandant in one of the States in the Union, "to recall the better class of the community to the realization of the existence of law and the habit of respecting it"; he decided "that the whole community was practically an armed mob"; and, in the absence of any one else ready or willing to do it, he began himself to swear affidavits against people for violations of the Enforcement Act, selecting as the first objects of his pursuit certain merchants who had signed an agreement not to employ persons who voted the Radical ticket. In fact, he took the darkest possible view of the moral, social, and political condition of the people around him, which may or may not have been mistaken, and thereupon took it on himself to "start civil functions," as he called it, by beginning the work of a public prosecutor, getting out warrants and then executing them with his own force. We should judge from the reports of his conversations, as well as from the troubles he has had with General Emory, his superior officer, that he is an excitable, active-minded, zealous person, who chafes under the limitations of a military life and fancies he would make a good legislator, and has, in short, more zeal than discretion. This is a matter that his commanding officer might and, under ordinary circumstances, would set right. Discipline could not be preserved in any army if the officers were allowed to undertake, without orders, the regulation of the morals of the community in which they are quartered. But the circumstances of this case are not ordinary. There is no agreement about the facts of the situation at the South. Different officers tell different stories. General Emory tells a different tale from General Sheridan; Colonel Morrow from Major Merrill. The question of remedy for Southern troubles is one of the most fiercely contested questions of the day. A party which is equal if not superior to the Republican party in numbers, is totally opposed to the Republican view of the matter, and means to fight it bitterly. Under these circumstances, it is madness for officers of the regular army to suppose they can meddle in the matter, even under permission from their superiors, either with safety to themselves or profit to the country. We are sure the advice of everybody who most appreciates their character and services would be that they should confine themselves rigidly to obedience to orders and abstain totally from denunciations or predictions about the political situation. Their reports on political matters are sure to have no value in Democratic eyes, and are sure to be used as party documents by the Republicans; and it is just as sure that the real politicians on both sides would any day be ready to unite and destroy them, or harass them by reducing the force or cutting down their pay. Indeed, we confidently expect to see, as a result of General Sheridan's and Major Merrill's indiscretions at the South, a vigorous attempt made next winter to cut off the army appropriation altogether, or saddle it with a condition that the troops shall be completely withdrawn from the South.

## AN IDEAL REFORMER.

"I PLEAD a great cause which is dying for want of funds." So ran the united statement and request which we received only a few months ago from a man whose name might have been placed at the head of this article, as he will furnish the principal illustration of what we are about to say. It is quite possible that many of our readers have never heard of George Trask, though to all New Englanders his name must be one of the most familiar of sounds. For the benefit of others, we may explain that he was a man who for twenty-five years had been working in every imaginable way to stop the use of tobacco. He circulated pledges and medals among children, talked to pupils in public and Sunday schools, preached three or four times on Sunday and lectured on Monday, wrote and distributed a multitude of tracts, and even published an anti-tobacco journal. He formed, also, an "American Anti-Tobacco Society," though up to the day of his death he remained, we believe, its sole officer and member. He gave up his regular occupation, that of a clergyman, and, without salary or associate, started on a crusade, belief in the success of which might well tax the credulity of a second Peter the Hermit. In the immense importance of this crusade, however, he was an enthusiastic believer, and his faith that he was initiating a vast and world-embracing reform was at least as perfect as that of the old crusader of eight hundred years ago. What could be the mental condition of one who devoted many of the best years of a long life to so Quixotic an enterprise? To many people, doubtless, his mind must appear wholly abnormal, and the answer to the above question, therefore, of no practical interest whatever. We believe, nevertheless, that he was the type of a large class of people, in most of whom, however, his apparently exaggerated features have become modified and more or less imperfect. This is really to say that we believe Mr. Trask was only a more than ordinarily good specimen of his kind. At all events, whether we are right or wrong, the subject will repay a slight investigation.

Happening to feel in the giving mood when we received the appeal quoted above, we sent a dollar, and in response there came back a huge pile of tracts, pamphlets, journals, and books. As a pecuniary investment in paper and printing, it was the largest return we ever received for our money. We have no doubt, in fact, but that the principal part of the literature of the anti-tobacco reform movement is now lying before us. We have not read every line of this literature, for life is short, but we have so faithfully gone through it that we feel competent to stand an examination with regard to all its essentials. There are tracts entitled 'Tobacco a Foe to Marriage,' 'Can a Christian Smoke Tobacco?' 'An Appeal to Professors of Religion in the Connecticut Valley who devote their lands to the Culture of Tobacco,' 'How to Conquer the Quid,' etc., etc. There is an open letter to General Grant, another to the Rev. Mr. Murray, another to the Evangelical Alliance which met year before last in this city. The style in which the above are written may be partly gathered from the titles and partly from the common synonym used for tobacco, which is "the unclean devil." The arguments of these curious productions are of course very few, and are soon exhausted, all the late publications being wearisome repetitions of what has been previously said. The most horrible bit of literature is a small book called 'Uncle Toby's Stories for Sabbath-Schools and Bands of Hope.' It is thoroughly coarse and disgusting, and when we remember that this was a great favorite with the author, and that it has been circulating for years among children, we are compelled to modify somewhat the charitable feeling we endeavor to conjure up for the purpose, if not for the method, of Mr. Trask's work. The most interesting production is a volume called 'Notes from Anti-Tobacco Campaigns,' filled with disjointed sentences copied from the author's diary, but giving a tolerably distinct mental portrait of the man himself. This, therefore, is what we wish, and shall mostly use for our present purpose.

Of course the man's most prominent mental characteristic was his belief not only in his work but in himself. This is in fact the first necessary trait of all reformers. The only variation is in the manner in which this belief is expressed. In some reformers, those whose names are written with capitals on the pages of history, we call this quality by great words—heroism, innate nobility; in others, as Sylvester Graham the vegetarian, we are a little in doubt what word to apply to it. In George Trask we shall leave it also without name, giving only a few appropriate quotations. He was "born when *men* were born," in "a town blessed with as many clever people as any on the map." We learn that he has advocated all righteous reforms "in a fearless manner," and, if his clerical associates do not agree with him, sees no reason why he should "come down to wrangle with such brethren." Sometimes this pride is cloaked in the dress of humility. He is only a weak servant of God, of "humble dimensions," of "poor ability." "Whatever God does by my agency, he shows that he can do business on a small capital." Even this last sentence, apparently framed to express depreciation of himself, tells that he was the agent of God for a special work. Intense egotism is the first absolute essential of all reformers. It may be grand or it may be ludicrous, but it must exist or you have no reformer. This is the spiritual rock on which he leans, or to which he flies for refuge; it

saves him from discouragement. That Trask could not be discouraged is evident from a single extract from his diary. "Three red cents in my treasury to hire a hall, pay board, and battle the most popular of all narcotics. God give me grit and grace." There shines the spirit of the true reformer.

When a man mounts a hobby, and gazes upon the world through the colored spectacles of his mission, it is astonishing how much he sees which no one else imagined to exist, and what curious shapes are taken by all things looked upon. Not only riding, but eating, drinking, and sleeping, as it were, in an atmosphere of imagined tobacco-smoke, Mr. Trask became unable to see anything which was not smoke-colored. He visited an insane asylum, and came away persuaded that tobacco caused a great deal of insanity; he visited a prison, and finding that every prisoner used tobacco, felt convinced that in some way it must be intimately allied with crime. A certain minister had had no revival in his parish for several years, but Mr. Trask ascertained that the minister smoked, therefore tobacco interferes with the preaching of the Gospel. Another minister was somewhat heretical, but he also smoked; therefore tobacco leads to infidelity. A man suddenly drops dead, but he chewed tobacco, therefore tobacco causes sudden death, paralysis, and heart disease. He visited Harvard College during the commencement exercises of 1853, and saw that, "with rare exceptions, the young gentlemen were pale, lank, and lean—the pitiable victims of smoke."

Another peculiarity, more curious even than this tobacco hue given to all things, is his intellectual and moral estimate of men, which, without exception, depends upon their sympathy and assistance given to or withheld from his sacred cause. All sympathizers and abettors are "intelligent," "earnest," "good-hearted," "noble," "godly"; all who turn away are "cowards," "weak-backed," "inconsistent," "do-nothings." As the contributed receipts for his lectures were frequently very small, and the payment of his hotel bills consequently not always a matter of pleasure, it is interesting to note how he gradually acquired a perfectly accurate standard of measurement for moral worth, namely, the amount of money which a man or a place contributed to his support. When the collection is very small, the people are dead in trespasses and sin; when the collection is large, the people are wide awake, seekers after truth. "Men of large souls" are those who contribute five dollars, while "splendid specimens of humanity" contribute ten dollars. "A man every inch of him" gave ten dollars, and "a hero" the same amount. Once, a wealthy gentleman, personally solicited, gave a check for one hundred dollars, and although an inveterate smoker, he appears in the "Notes" as "a princely man." On the other hand, after lecturing in a certain town, we read: "No contribution, no thanks. The Lord have mercy on this tobacco and rum-cursed people." And with this last quotation we shall take our leave of Mr. Trask. We have employed him to illustrate the common traits of his class, as he is the latest perfect example of a reformer whose work is now done.

The man who believes that he is in advance of his age in the perception of either a great evil or a great good, and that the cause in which he engages is incomparably the most important of all causes, must unavoidably measure all persons by their appreciation of him and of his mission. All other peculiarities of the ideal reformer, therefore, of necessity rest upon the sublime or ridiculous egotism which makes him a reformer. If it happens, as is sometimes the case, that the conditions and necessities of the age in which he lives and his own abilities as related to these necessities are in accord, his reform succeeds, and he may become immortal. But if, as generally happens, he miscalculates with reference to any one of these things, especially if he mistakes for ability, or for a call to a mission, "the reaction of a great self-love which incapacitates its possessor, or rather its victim, from subordinating his personality to the laws of the existing organization," then inevitably he more or less miserably fails. Of course there are failures which command our sympathy, and successes which obtain only pity. Whether we consider Buddha, Peter the Hermit, Luther, Ann Lee, Graham, Trask, or any one of an almost infinite number whose names are linked with an indescribable variety of real or imagined reforms, and whose efforts were attended with every possible degree of success or of failure, we find the mental process in each case was almost identical. First, there arises conception of some evil to be destroyed or some good to be introduced; then the mind dwells upon this one thing until its proportions become enormous and it blots out the sight of all but itself; lastly, there comes the idea of a call, a mission, a purpose to carry out that which so imperatively demands to be done. It is evident, we think, that the mind of the reformer, as thus indicated, is one of which in the progress of civilization there will be less and less manifestation. Not only will it become more difficult for any one to believe that the sudden rectification of a real or imagined abuse will make the whole world new, not only will it become almost impossible for any one to fancy that he and he alone is chosen for some mighty work of regeneration, but, as matter of fact, the more society is civilized the less will it need reform (in the professional, technical sense of the word), and the more will progress be made by gradual development. This development will be more constant, more general, more thorough, less spasmodic than reform. Reform in its nature belongs to a less advanced society—one which can with less injury be subjected to the abrupt changes which it requires. No highly organized form admits of being dismembered or turned inside out, or is benefited by the process. It is not in the physical world only, but also in the moral and political, that nature refuses to go forward in jumps. The man, moreover, of sufficient ability to become a reformer hereafter will be the man most likely to see clearly the fact that this revolutionary reform is not what is wanted. We have but little doubt that the civilized world has already witnessed the last brilliant instances of great and successful reform—we mean reform in the sense in which the word was understood by Mr. Trask and all others of the class to which he belonged. Already the peculiar kind of mind which is needed to carry on a genuine reform of this order is more difficult to find than at a period not very far remote. Very rapidly the present generation is coming to regard the reformer, when seen alive, as an instance of survival of, or more properly of reversion to, a lower type of mind than that which is now most desired. This may not be a happy thought for certain would-be reformers of to-day, but may be all the more wholesome for their reflection. Necessary as the reform spirit may have been in past generations, and fondly as it may be admired by many of the present day, it is probable that the world will be none the worse when the old reformer, like the old dodo, shall have become extinct.

## THE NEW KING OF SPAIN.

PARIS, Jan. 15, 1875.

WHATEVER may be said of the Spaniards, they are prompt in their decisions. See how many revolutions have taken place on the other side of the Pyrenees. First, Queen Isabella is dethroned after the battle of Alcolea; then come in rapid succession the Regency, the assassination of Prim, the short reign of a prince of the House of Savoy, the proclamation of the Republic, the Communistic or Cantonal movement, the *coup d'état* of Pavia, the dictatorship of Serrano, and finally the restoration of the young Prince of the Asturias under the name of Alfonso XII. It seems as if the cycle were closed for a time; an irresistible instinct has thrown Spain back into her old monarchical traditions. The young Prince comes back as powerful as Louis XIV. after the troubles of the Fronde; he has not even a Parliament to address with his hunting-whip in hand. He has no need of holding a *lit de justice* in a parlor surrounded with the regiments of his guards. The grandees of Spain had all held aloof from the foreign dynasty, and I happened to be present at the first soirée in Paris at which Alfonso received the grandees who had taken refuge in Paris. How many multicolor orders they wore, and how many golden keys on their backs! What a kissing of hands, what effusions of loyalty! The young King seemed quite at home among them, though he spent last year first in the Theresianum near Vienna, and afterwards at the military school of Woolwich, in England. He seems a bright, amiable young man, and if I had taken the liberty to give him advice, I should as naturally have told him not to smoke too much as if he had been my son. I had a few words with him in the smoking-room (every house in Paris now has a *fumoir*), and as I have a natural aversion to phrases learned by heart, I said to him not a single word about Spain. We talked of England, and his remarks were sensible and well expressed. He regretted not to have had time to stay longer in England, in order to learn the English language more perfectly. He speaks French and German with the greatest fluency. I could not help examining with the curiosity of the moralist the men and women who met on this occasion. There was the Duke of Rivas, the son of a great poet and a poet himself, who has always remained true to the King's cause, and who will probably be sent as ambassador to Rome. There was a Duke of Baylen, a name which recalls a disaster to France; a Duke of Tetuan—I don't know how many others; men who had been often divided in politics, and who forgot their differences for a time; Queen Isabella, in the pride of her indirect triumph, who asked herself probably if she would be allowed to return to her country; the advisers who had given her such fatal counsels; her mother, Queen Christine, in her widow's cap, looking quite old and gray, with only a remnant of her beauty; the children of Rianzarez; the Duc de Montpensier and his handsome daughters, the youngest of whom may one day wear the crown of Spain on her head; the Duc Decazes, who, as Duke of Glücksburg, took part in the negotiation of the Spanish mar-

riages, and who lived long, almost in poverty, at Madrid after the revolution of 1848, which broke his diplomatic career. As Minister of Foreign Affairs in the Cabinet of Marshal MacMahon, he had recognized the impotent government of Serrano almost at the dictation of Germany, knowing well that recognition did not mean perpetuity.

A few days afterwards, the same people were to be seen at the inauguration of the new Opera. I had often wondered in my mind who would be the first person to open this gigantic hall of music, begun and almost ended by Napoleon III. When I went to see for the first time the pictures of Baudry in his studio, which was in the very highest part of the building, it was after the Commune. The soldiers and the communists had been fighting on the high roof, round the two gigantic winged horses, and in the very arms of the giant Apollo, which had for two months been made to bear a red flag. Everywhere the traces of the balls were visible. I confess that at that time I had an involuntary fear, which I could not repress. I saw for a moment, in a sort of hallucination, the great theatre filled to suffocation with German soldiers, and in the great Imperial box the new German Emperor, Moltke, and Bismarck with their helmets on their heads. M. Thiers once hoped that he might inaugurate the building; and now, by a strange fortune, it had become the duty of Marshal MacMahon. There he was, with his gray little moustache and his red ribbon, receiving the motley assemblage of princes, of deputies, of ambassadors, of writers and artists. The young King of Spain was the lion of the evening. Every movement of his was watched. When the handsome Princess Murat, now Duchess of Mouchy, offered him a bunch of violets taken from her enormous bouquet, he gracefully placed them in his button-hole, and the Bonapartists have been exulting ever since: "You see he belongs to us. We also have a young prince, still at school, whom the French army will some day bring back to this place!" Queen Isabella, who is a Bonapartist at heart, probably out of jealousy of the influence of the Duc de Montpensier, as soon as she heard of the pronunciamiento telegraphed to the Empress Eugénie announcing the event, and adding that she hoped she would herself soon hear as happy news. The Government found itself obliged to intercept this telegram.

The young King Alfonso is said to have character, but as he is only seventeen years old, and has lived so long out of his own country, it seems hard that he should be left at once without guides. To talk of parliamentary government in Spain is to use a word without its precise application. Whether the Cortes sit or not, the authority is always disputed by irresponsible persons, who move and plot in the court, and use the ministers of the day as mere instruments. Of the two persons who are said to be already disputing the rôle of favorites, one is the Marquis of Alcañices, Duke of Sesto, who married the widow of the Duc de Morny; he has an enormous fortune, and was once the leader of fashion at Madrid, but seems now to aspire to political honors. He is at present Civil Governor of Madrid, and is said to be on the most intimate relations with the new sovereign. His rival in authority is Canovas de Castillo, the head of the Cabinet formed after the pronunciamiento of Martinez Campos. It would be most fortunate for Spain if young Alfonso proved to be one of those born leaders of mankind who are able to frame a policy of their own. All parties are exhausted; all the public men have lost their prestige. Serrano will probably soon be seen with his wife in a box at our new Opera; Castelar will write innumerable articles on the progress of republican ideas among the Latin races; Prim is in his grave; Espartero is a mere shadow of himself; the Carlists alone are still keeping up their desultory warfare; but most of the officers of Don Carlos, who have fought persistently against the upstart governments of the Madrilenes, will be happy to re-enter the ranks of the regular army, providing they can preserve their grades. Don Carlos will soon be reduced to firing off empty proclamations. The long carnival of the civil war is over. Towards the end, the Spaniards themselves hardly took any interest in it: the revolution had become a mere farce, like a bull-fight. The illustrated newspapers of Madrid will have something better to do than to show every week to the public new faces of new politicians and generals; they will give us representations of all sorts of royal entertainments. The old *dueñas*, keepers of royal etiquette, will come out from their retirement; the *majordomos* will brush up their uniforms; and the young King will be able to say "there is nothing changed in Spain."

It is frivolous to look upon such an extraordinary succession of events with mere irony; they ought to teach us some more profound lesson than the lessons of the ordinary moralist. The laws of history cannot be offended without serious trouble and injury to nations, and the law of gradual development is one of those laws which everything tends to make more apparent. It is idle to plant a germ where it cannot grow, idle to make constitutions where the first elements of constitutional life are wanting. There is a substratum of ignorance, of indolence, of helplessness which cannot bear the structure of republicanism. There is a mystic force in dynasties which cannot be despised; they are as much the work of time as the nations themselves. They have their rise, their growth, and their fall like some organic being. It does not seem as if the Bourbon dynasty had lost yet all its vitality in Spain. With all its faults, and perhaps partly on account of these faults, it seems to be still in harmony with the political and social state of the Spanish people. A proud and haughty people, fallen from its ancient station, impoverished, deprived of most of its possessions, yet capable at times of great and heroic deeds, patriotic enough to resist all foreign influences, is not unfitly represented by the young King who has just ascended the throne of his ancestors. He has seen his mother exiled, he has been an exile himself; but wherever he has gone, even among the boys at school, he must have felt that there was something in him as a virtual successor of Charles V. which spoke to the imagination of mankind, and which moved the Spaniards he met with almost to tears. In the very capital of revolutionary ideas, in Paris, he saw a large audience, composed of all that France honors and respects, rise in his presence. Let him understand that this great force does not belong to him in person, that he has it only, so to speak, in trust, and that he would be failing in his duty if he did not try all his lifetime to use it for the benefit of a distracted country and a people whom an excess of misgovernment alone could determine to exile his mother. It is much to be hoped, hard as this duty may be, that he will not allow the unfortunate Isabella to return permanently to Spain. She is probably one of those persons who can neither learn anything nor forget anything. Her brilliant intellect, for she is remarkably intelligent, has always been suicidal. Louis XIII. was obliged to part with his mother; King Alfonso ought not to be weaker than Louis XIII.

# Correspondence.

## THE LIPPINCOTT-CHAMBERS ENCYCLOPÆDIA.

To the Editor of The Nation:

Sir: There is one almost ludicrous feature connected with the alteration of the text of the English edition of Chambers's Encyclopædia by the Messrs. Lippincott, which has thus far escaped notice. It is customary in most, if not all, works of this character, where space to discuss a broad subject exhaustively is not available, to refer the reader at the close of articles on important topics to other works by recognized authorities for more detailed information. In the case of the article on "Free Trade" substituted by the Lippincott editors for the Chambers's original, the custom thus referred to has been followed; but as if the unsophisticated reader would not be sufficiently humbugged by being told little else in the article than that "free trade" was originally an English theory, devised and advocated for exclusively selfish purposes, but now wholly exploded, he is recommended at the close, if he desires to know anything more about the matter, to consult solely and exclusively the works of Henry C. Carey.

If there is anything in any collection of curiosities of literature quite equal to this in ludicrousness and absurdity, it has not been my good fortune ever to hear of it. Indeed, to find a case exactly parallel, it would be necessary to suppose that the editors of the Lippincott-Chambers had substituted an article on the "Christian religion," in which, after stating that the system was one formerly much thought of—especially by the priests—but latterly was not believed by any truly sensible people, should conclude by recommending the bewildered but still enquiring mind to satisfy its desire for further enlightenment on the subject by consulting the works of Tom Paine generally; adding, possibly, if it was thought best to strain a point in respect to copiousness and impartiality of reference, Volney's 'Ruins.' And yet the Messrs. Lippincott, in their recent explanatory letter to the *Nation*, make use of the following language: "*We believe that the true province of an Encyclopædia is not to advocate the theories of any man or class of men, but principally to embody in convenient form statements of facts.*"

Finally, this whole transaction affords one more striking illustration of the tactics which of late years have been employed by the advocates of protection to bolster up and keep alive their fast declining cause in the United States. These tactics may, in brief, be summed up as follows: *First*, to denounce and abuse all opponents of protection and advocates of *free* or *freer* trade as either Englishmen, British hirelings, or student doctrinaires, who have no practical knowledge of the subject. *Second*, to appeal to and encourage national prejudices by representing that the question of free trade or protection is simply a question of English or American manufac-

turing supremacy, rather than a question of abundance or scarcity resulting from the freedom or restriction of commercial intercourse or exchanges. *Third*, by suppressing or perverting information (as in the Chambers-Lippincott case), by avoiding anything like free, fair discussion, and by seeking to manufacture public opinion through the press by direct purchase or the indirect influence of money or patronage.

It is, however, most encouraging to perceive that, notwithstanding this system of propagandism which, since the outbreak of the war, has been worked so persistently, the end of protection in this country draws near, as is clearly proved by the following circumstances, namely, that, outside of Pennsylvania, the number of influential journals which advocate protection because their editors really believe in it can be counted on one's fingers, and is yearly diminishing; that no first-class instructor in any of our first-class colleges or educational institutions can be found who is willing to teach protection as an economic system worthy of adoption; that nine-tenths of all our educated young men who are coming forward to fill the places of influence in all the professions are free-traders on principle; and, finally, that the results of a fourteen years' trial of the protective policy under the most favorable circumstances, as shown in the present depressed condition of the industry and commerce of the country and the nearly complete exclusion of all American manufactures from the world's markets, constitute in themselves arguments with the masses for the abandonment of the theory of interference and restriction as a means of national development, which can neither be answered nor resisted.

DAVID A. WELLS.

---

[The comicality of the reference to Mr. Carey was pointed out on p. 299 of the *Nation*, Vol. XVIII., in our first allusion to this subject. We think a still more apt illustration than Mr. Wells's would be an article in an encyclopædia on the Copernican system of astronomy, followed by a reference to only one work on the subject—the 'Almagestum Novum' of Riccioli, in 1653—in which he exposes its absurdity from top to bottom. He was able to use one argument against it which our friends in Philadelphia evidently think very powerful, viz., that the motion of the earth around the sun was never heard of until the middle of the sixteenth century.—ED. NATION.]

# Notes.

A WORK on Harvard University, to be published by subscription, is on the eve of making its appearance. It will be illustrated by upwards of one hundred engravings, of various kinds, including fifty-eight heliotype views of the buildings and grounds. The contributors are from the élite of the alumni, and the subjects too numerous to mention here. A prominent feature is a history of the College by Samuel Eliot. The volume, elegantly printed, will be of imperial quarto size, and according to binding will cost from $30 to $40. Subscriptions should be sent to F. O. Vaille and H. A. Clark, Old President's House, Cambridge.——Bulletin No. 32 of the Boston Public Library gives, in a note on Dawkins's 'Cave-hunting,' a long and useful list of kindred scientific works, among which occur a few titles extracted from the book itself. The Superintendent requests the aid of scientists in perfecting this enumeration for future use in the library's catalogue.——A small military history of our late civil war, by Major Scheibert, of the Prussian engineers, has been published in Berlin. The author's view is a partial one, as must needs be, seeing that it is set forth in 182 pages. He served with Lee in the Virginia campaigns, and devotes himself chiefly to these. As he ardently espoused the cause he fought for, it is not singular that he should prefer the Southern military genius to the Northern. In other respects his fairness is not impeached.——Sigmund Soldan, of Nuremberg, is publishing in photographs the works of Peter Vischer. The text is by Dr. Wilhelm Lübke, professor of the history of art in Stuttgart. It is to appear in four parts, at about eight thalers a part. What gives special interest to this publication is the reproduction in photograph of Vischer's masterpiece, the superb metalwork of the Town Hall of Nuremberg. The original is now lost, but the fortunate discovery of the drawings a year ago at last enables the student of art to follow the career of the great master from his early severity to the exuberant fancy and wealth of detail which graced the works of his best days.——Among the announcements of the publishing-house of B. G. Teubner (Teubner's *Mittheilungen*, by the way, may be had of any bookseller gratis, or will be forwarded direct on application), we note a reprint of the 'Elogium Tiberii Hemsterhusii, auctore Davide Ruhnkenio.' The Latinity of the title is questionable; but it is refreshing now and then to dip into a book written before the invention of Sanskrit. We hope this book may be followed up by Wyttenbach's life of Ruhnken himself. The *Mittheilungen* also gives what is certainly a great convenience—a list of the reviews of Teubner's publications.——Robert Clarke & Co., Cincinnati, will republish a humorous Scotch story, 'Generalship; or, How I Managed My Husband,' by George Roy.——F. B. Patterson, 32 Cedar St., announces a volume of Poems by Geo. A. Baker, jr.

—Mr. Carlyle's account of the 'Early Kings of Norway,' now appearing in an English magazine, is drawn of course from the only existing sources, namely, the Icelandic sagas, and more particularly from that remarkable series of sagas commonly called the 'Heimskringla,' the work of Snorri Sturluson. The most ordinary sense of obligation therefore should have induced the English writer to spell the name of the famous Icelandic historian correctly, instead of employing, as he does, the corrupted Norwegian form. In fact, if Mr. Carlyle were to write an English book on the 'Early Generals of Carthage,' derive all his information from a French paraphrase of Livy, and constantly cite his authority under the Gallicized name of 'Tite-Live,' he would do precisely what he is now doing. His offence is the more noticeable since it is committed by a writer who insisted upon styling one of his previous works a 'History of *Friedrich II.*' In regard to other proper names, too, his orthography is by no means to be commended. The form "Haarfagr" is a singular mixture of ancient Icelandic and modern Norwegian, while the forms "Tryggveson" and "Rögnwald" are neither Icelandic nor Norwegian nor English, nor anything else but pure Carlylese. Mr. Carlyle has apparently not had recourse to the Icelandic originals of the sagas, but has depended upon the modern Scandinavian translations, and perhaps in some measure upon the English version of the 'Heimskringla' by Mr. Laing, which is itself only a translation of a Norse translation. Nor would he have complained so frequently of the chronology of the sagas—in which he follows his equally uninformed countryman, Mr. Freeman—if he were familiar with Gudbrand Vigfússon's 'Tímatal,' which satisfactorily settles most of the principal dates. But the life of the ancient men of the North both on land and sea, in camp and court, was so full of dramatic incidents, so rich in interesting traits, that the 'Early Kings of Norway,' despite its small errors, will doubtless turn out to be a most entertaining book.

—Apropos of our Note on the Greek word for "daily" [bread] in the Lord's Prayer, a learned correspondent sends us the following correction. We had remarked of ἐπιούσιον that "Origen considers the word as invented by the Evangelist, but gives no etymology of it." In this, it seems, we were mistaken, along with Olshausen, whom we followed without verifying. "Origen distinctly says that it is analogous to περιούσιος (in the Septuagint), and is a derivative of οὐσία, and that it means 'contributing to (or beneficial to, or benefiting) [our] nature (being).' Moreover, he prefers this etymology to that which refers it to ἐπιέναι (ἐπιοῦσα). This shows the antiquity of the discussion. As to the Arabic and Æthiopic versions of the New Testament, they are of no great weight, being essentially mediæval." The references to Origen are Vol. I., 509C (246), and 517A (249), Migne's edition. In saying that we owed the version of "daily" to King James's translators, we should have qualified the remark, which implies that they first proposed this translation, whereas they adopted it from Tyndale. Another correspondent, who touches on this point, refers to the fact that "Mr. J. Hammond Trumbull, in his 'Notes on Forty Algonquin Versions of the Lord's Prayer,' has shown what difficulty certain translators have found in rendering this clause. Among the specimens given are words meaning 'our eatings' or 'victuals'; 'baked corn'; 'pone,' or literally 'something baked,' and 'what we may live on'; while other versions use a word which meant a wheaten *loaf* of the European fashion, from which pieces were to be cut off instead of being broken like corn-cake."

—The last number of the *Historische Zeitschrift* (1874–5) contains a review by Prof. von Holst of Jameson's 'Constitutional Convention,' which he pronounces "one of the most solid and valuable labors upon special departments of American constitutional law." The principal defect of the writer he finds in a certain rigidity of logic, rather characteristic of the judge than the advocate, which incapacitates him from fully appreciating the development (*Werdende*) of constitutional law. Two features of the work he especially criticises from this point of view: first, Prof. Jameson's expression "quasi-sovereign" as applied to the States, an expression which he shows to be devoid of legal precision, and also inconsistent with the author's own definition of American sovereignty, viz., that it resides "in the corporate unit resulting from the organization of many into one, and not in the indi-

viduals constituting such unit, nor in any number of them as such, nor even in all of them, except as organized into a body politic and acting as such." The second point is the subordination of the Constitutional Convention to the Legislature—a reaction from the opposite theory, which places it even above the people. He allows himself, "misled by the history of Secession, and by the preponderance of his juristic thought over his political thought, to put on the 'Constitutional Convention' a strait-jacket."

—The last number of the *Law Review* contains several contributions interesting to lawyers and also to laymen. "The Proposed Codification and Reform of the International Law" is an article which treats at length of the recent proposals of Russia in the direction of humanizing warfare, which, the writer says, aim not at an era of peace and good-will, but at the certain triumph of military absolutism. There is also an article on "Authors' Rights before Publication—The Representation of Manuscript Plays," which discusses and dissects the curious theory that the audience at a lecture or at a theatre has quasi-piratical rights in the subject treated or play represented, provided they exercise them in the first instance *memoriter*, and not by phonography or any other artificial means; that there is a distinction in law between getting possession of other people's ideas through the unaided human memory and acquiring them by means of pen, ink, and paper. This curious argument has actually been given a legal form in this way: "In the case of a public dramatic performance, the public is held entitled to make use of that faculty which is necessarily addressed to such representation, to wit, memory, for the purpose of repeating the contents of the play, even in performing it elsewhere, when the owner has laid no restraint upon such use of the knowledge so obtained and retained by memory only"; but, as the writer of the article very truly says, "this reasoning is based upon the fallacy that memory, being given to man to be used, any use which can be made of it is legitimate, and that if a spectator at a public performance is enabled to carry away in his memory the contents of a play unrestrained by police arrangements, he has acquired a lawful right to make any use of such play he chooses, however injurious it may be to the owner. The unsoundness of this doctrine is too apparent to need serious consideration. It would be about as wise to argue that because a man has hands for legitimate uses he is also justified in putting them into his neighbor's pockets." The concluding article on "The Potter Act at Washington" raises a point which we have never seen discussed anywhere else, as to the effect which may be given by the Supreme Court at Washington to the Ordinance of 1787 in its relation to the Wisconsin legislation. The Ordinance contained this provision (Art. II.): "And, in the just preservation of rights and property, it is understood and declared that no law ought ever to be made or have force in the said territory that shall in any manner whatever interfere with or affect private contracts or engagements bonâ fide and without fraud previously formed." Now, the *Law Review* (and, from what we know of both, it is a better authority than Chief-Justice Ryan of Wisconsin) on this makes an argument that we believe will be found pretty difficult to assail:

"The Ordinance, therefore, is recognized as law in Wisconsin by the courts of that State, *wherever there is no conflict* between its provisions and their constitution. If its late decision be interpreted indirectly as an adjudication that, since the Potter Act is upheld, the Ordinance protection over contracts is abrogated, it is to be noted that this point was not raised or argued before the Court in that case; and also that even if the adjudication were directly to that effect, it would be open to revision at Washington, since the statute of August 7, 1789, recognizes the Ordinance and confirms it; and also that the Ordinance is itself before the Supreme Court as a 'contract' sought to be impaired by the legislation of Wisconsin. Moreover, the Supreme Court of the United States may now be asked to construe the 'contract' clause and the 'reserved power' clause in the Wisconsin constitution itself, and decide whether they do not impair the obligation of the great contract of 1787, which was to be for ever unalterable except by common consent, and under which corporate charters, mortgages, and bonds would all be fully protected. Unless it is held that by *implication* alone, arising merely from the adoption in the constitution of a less comprehensive but not repugnant form of words, that vigorous provision in the Magna Charta of the Northwest is annulled, then those words of the Ordinance are imported into the 'reserved power' clause of the Wisconsin constitution itself; and that clause cannot be supported under the Constitution of the United States, unless it be read with a proviso. 'All general laws or special acts enacted under the provisions of this section [on corporations] may be altered or repealed by the legislature at any time after their passage, *provided, however, that such repeal or alteration shall never in any manner whatever interfere with or affect private contracts or engagements*, bonâ fide *and without fraud previously formed.*'"

—The annual report of the President of Harvard College discusses two subjects which have a good deal of general interest, one touching such physical questions as digestion and nutrition, and the other being related to matters purely intellectual. Memorial Hall at Cambridge was last summer formally opened, and it is now used as a Commons Hall, much to the satisfaction of those who so use it, according to the president's report, and, we may add, much to the satisfaction also of the inhabitants of Cambridge and the neighboring towns, who resort to this hall for the purpose of "seeing the students eat"—a sight which has not been seen in an American college, or at any rate in Cambridge, for many a year. The history of the organization of the present system of commons is given by the president at length. Before the opening of the hall, a club, known as the Thayer Club, had had a sort of limited commons, and thus paved the way for the larger scheme.

"Before Commencement, a sufficient number of law, scientific, and college students had signified their intention to join the new association to warrant the corporation in making the necessary outlay to procure gas-fixtures and heating apparatus for the dining-hall and the eight small rooms adjoining it, to fit up the basement of the hall with kitchens, sculleries, store-rooms, a bakery and a laundry, to provide tables, chairs, linen, glass, china, and cutlery sufficient for five hundred persons, and to furnish sleeping accommodation for about fifty-five servants. The work of fitting up the hall was actively prosecuted during the summer vacation, and on October 1 the hall was occupied by five hundred students, although the mechanics remained at work in the building until nearly the 1st of November. The outlay of course proved much heavier than had been estimated, the greater part of the mechanics' work having necessarily been done by the day; it finally exceeded $40,000. Upon this outlay the students' association pays interest, and it also pays a reasonable sum annually for the ultimate extinguishment of the debt. The corporation advances from week to week the money to pay the bills of the association for heating, lighting, service, and provisions, and interest is charged on these advances. The whole cost of carrying on the hall, including the above-mentioned charges for advances, is assessed by the officers of the association upon the members thereof, and the amounts thus assessed upon the several members are collected in the university term-bills by the Bursar. The association elects annually a president, a vice-president, and two directors from each school of the university and each college class; and these officers regulate the diet in the hall, preserve order, and exercise a general control over the expenditures of the association. With regard to the diet and expenditures, however, it is distinctly understood that the object of the association is to provide a simple, substantial, wholesome table, at as low a price as is consistent with due order and comfort. The officers of the association choose from among its members an auditor, who keeps the weekly lists of persons boarding at the hall, supervises purchases and expenditures, and makes a monthly report to the officers. The corporation appoints a professional steward, who makes all purchases, employs and directs all servants, and, in general, carries on the hall. The steward must be dismissed by the corporation, on reasonable notice, at the request of two-thirds of the officers of the association. The steward receives a fixed salary, and, in addition, a small sum each week for every person who boarded that week at the hall; but this head-money is proportionally diminished as the average weekly price of board exceeds four dollars. Any person may withdraw from the hall upon giving one full week's notice of his intention. It is the interest of the steward, on the one hand, to satisfy the students so as to keep the hall full, and on the other, to keep the price of board as low as four dollars a week, so as not to diminish his head-money."

—This form of organization is, as the president says, the result of many trials. There was in old times in Cambridge—as far back as the "good old Colony times" celebrated in undergraduate song—a sort of commons, of which the traditions are preserved to this day, and we are sorry to say that those traditions were of unlimited license at table, of much discontent on the part of the students, manifested in irregular and unconstitutional ways, and much tribulation on the part of the authorities. From 1849 to 1865 the college gave up the business altogether, and left the students to find their own boarding places, but this, of course, sent up the price of board to fabulous prices, which in turn induced many students to "board themselves," or, in other words, to buy their own food and cook it in their own rooms—a practice "dangerous to health, and very undesirable in every point of view." Then came the Thayer Club, and now Memorial Hall appears at last to solve the problem which has agitated the college for two centuries—though Mr. Eliot says that it is "too soon to pronounce with absolute confidence." The great advantage of the new system is that the faculties of the university have nothing to do with the business.

"The corporation has only to appoint the professional steward, to advance the money needed, which it recovers on its own term-bills, and to watch for the proper care of the building, considered as a monument and a valuable piece of property for university uses. As a condition of giving their aid, the corporation lay down three rules, two of which have reference simply to economy: First, that no wine, beer, or other alcoholic drink, and no tobacco, shall be used in the hall; secondly, that there shall be three courses at dinner, and no more; thirdly, that the joints of meat shall not be carved upon the tables. Through their chosen officers and their auditor, the students have real control of the whole establishment. If complaints arise, whether well or ill founded, they must be dealt with by the officers of the association; if disorders occur in the hall, they must be repressed by the officers chosen by the students themselves; if improvements are suggested in the administration of the hall, or if promising experiments invite a trial, the directors are free to act in all things not settled by the original understanding with the corporation."

MALDEN PUBLIC LIBRARY

—The name of Charles Austin must be added to the list of the dead of 1874. He died on the 26th of December, at the age of seventy-five, at Brandeston Hall, his estate in Suffolk, where he had retired in 1848 on the proceeds of the most lucrative practice at the Parliamentary bar ever known. He was, whether we judge him by the encomiums lavished upon him by his early friends, or by the simpler standard of his reputation at the bar, or the still simpler standard of the fees which that reputation brought him, a very remarkable man. His income in 1847—the great "railway year"—was so large that the writer of a notice in the *Pall Mall Gazette* does not "venture to state the sums" he has heard mentioned, and he received so many briefs, merely given to prevent his appearance on the other side, that a story got into circulation of his being met riding in Hyde Park on one of the busiest days of the session, when, on being asked what in the world he was doing there, he replied: "I am doing equal justice to all my clients." But it is not by his career as a barrister that he will be longest remembered. He was more generally known as the gifted and brilliant brother of John Austin, of whom, as he appeared in his youth, a most agreeable account is to be found in Mill's 'Autobiography.' When Mill made his acquaintance he had just left Cambridge, after shining there "with great *éclat* as a man of intellect and a brilliant orator and converser." The Union Debating Society at that time was at the height of its reputation, and was the weekly arena in which the rising young men of the day (among them was Macaulay) first matched themselves against one another, advancing, as young men usually do, extreme opinions. Mr. Austin was at that time one of the most advanced of the younger school of liberals and followers of Bentham. "The impression he gave was that of boundless strength, together with talents which, combined with such apparent force of will and character, seemed capable of dominating the world. Those who knew him, whether friendly to him or not, always anticipated that he would play a conspicuous part in public life. It is seldom that men produce so great an immediate effect by speech unless they in some degree lay themselves out for it; and he did this in no ordinary degree. He loved to strike and even to startle. He knew that decision is the greatest element of effect, and he uttered his opinions with all the decision he could throw into them, never so well pleased as when he astonished any one by their audacity. Very unlike his brother, who made war against the narrower interpretations and applications of the principles they both professed, he, on the contrary, presented the Benthamic doctrines in the most startling form of which they were susceptible, exaggerating everything in them which tended to consequences offensive to any one's preconceived feelings. All which he defended with such verve and vivacity, and carried off by a manner so agreeable as well as forcible, that he always either came off victor or divided the honors of the field."

—Mr. George Walker has translated and reproduced in a pamphlet (D. Appleton & Co.), which he calls 'The Example of France,' two articles recently published in the *Revue des Deux Mondes*, by Victor Bonnet, the well-known economist, on the payment of the German indemnity and the management of the currency since the war. The pamphlet is worth careful perusal for the light it throws both on the way in which the French have coped with one of the most tremendous financial problems ever presented to any people, and on the conditions of a return to specie payments by any nation which has abandoned them for irredeemable paper. Perhaps the most remarkable consequence of the indemnity has been that it has inflicted serious injury on German trade and industry by producing a fever of disastrous speculation, while it has not only sobered and steadied the French, but has given them renewed confidence in their own resources. How were they able, close on a disastrous war, to pay such an enormous sum as $1,000,000,000 within the short space of three years, and still leave the exchanges in their favor, and the discount on their legal tenders hardly perceptible? M. Bonnet explains it, and the explanation is very instructive. In the first place, he draws attention to the frugality of the French, which, combined with their industry, make the national savings, he calculates, about $600,000,000 a year. Then France has, since 1815, been growing rapidly rich, and making all the countries her debtors. The balance of trade for fifteen years before 1870 was constantly against her—which M. Bonnet treats as a good sign, showing that she was receiving more than she gave out. Therefore she was able, in 1870, by merely transferring $400,000,000 in credits she had in foreign countries, to pay that amount to the Prussians without drawing at all on her own stock of the precious metals. Then she held a large amount of the securities of foreign countries, which, as soon as an opportunity of converting them at a profit into French rentes was offered, were sold off, and the proceeds—say $200,000,000—handed over to the Germans, again without any draft on French specie. Next $300,000,000 were raised by loans, in the main abroad, and the exact amount actually paid by the French Government to Germany in specie was only about $100,000,000. So that it may be said that the ease with which France met the frightful demand on her was due to the excellent condition in which the war found her trade, and, let us add, to the shortness of the war itself.

—The most instructive portion of the pamphlet, however, relates to the Bank of France, the discount on whose legal-tender notes never rose above 2½ per cent., and has now totally disappeared. The Government owed the Bank when the war broke out $12,000,000 and subsequently borrowed $300,000,000, for which it agreed to pay one per cent. per annum, and to reimburse it at the rate of $40,000,000 a year—an engagement which has been scrupulously carried out—and in return for this the Bank was allowed to issue $360,000,000 of legal-tender notes in addition to what was already afloat, and did accordingly issue them on a specie reserve of only $120,000,000. When $460,000,000 notes were thus out, in November, 1871, the premium on gold was only 2½ per cent.; in January, 1872, the issue reached $490,000,000, and the premium fell to one per cent.; shortly afterwards the volume of the paper currency was raised to $640,000,000, and the premium disappeared. M. Bonnet accounts for this extraordinary and unlooked-for phenomenon in this way: the premium of 2½ per cent. on gold was really caused by the fact that, at the very period when the country was making the largest purchases abroad in order to replace the losses of the war, the Government was also eagerly and industriously buying foreign bills in order to make its payments on account of the indemnity. As business and exports revived, and the exchanges again turned in favor of France, owing to the sale of foreign securities and to the large loans made abroad, the premium disappeared in spite of the fresh issues of paper money. The exchanges—owing to the economy and activity of the people, and the absence of all speculation, and the enormous stock of coin which, by reason of French commercial habits, lies in the hands of individuals, and which M. Bonnet estimates at $1,000,000,000 or $1,200,000,000—have ever since continued favorable; and the Bank has consequently been able, while reducing the volume of its paper by about $100,000,000, to increase its metallic reserve to about fifty-two per cent. of this amount in December, 1874.

—We mentioned in a late number the interest and consequent literary activity occasioned by the Petrarch festivals of last summer. This interest was not confined to the poet's native and adopted countries, but extended to Germany, and called forth the best monograph on the poet produced for many years. We refer to the work by Ludwig Geiger ('Petrarka,' Leipzig), in which Petrarch is considered principally as the man of letters and the patriot. It is natural that in New Italy Dante and Petrarch should have an important political significance; but for the rest of the world they are only its greatest poets. Geiger's work is excellent, both in its historic and literary details, and is based upon thorough original research. While speaking of Petrarch, we would express our regret that the best critique, in our opinion, ever written on the poet should be so little known out of Italy. We mean the 'Saggio Critico sul Petrarca' (Naples, 1869), by Francesco de Sanctis, the author of a very remarkable history of Italian literature, also not yet translated.

—There is reason for gratulation that the American Museum of Natural History in Central Park has secured Mr. E. G. Squier's antiquarian collection. This at least has been saved for an American institution, and will not pass into foreign hands to be locked up for ever in the museums and collections of Europe. Yet, as we lately stated, there was reason to fear that this would be its fate. Our Governments, State and General, seemed indifferent, and private liberality was not prompt to take advantage of this opportunity of displaying a public spirit. Mr. Squier was one of the first who brought to the subject of American antiquities knowledge, freedom from old prejudices and theories, and a spirit of patient and careful enquiry. He was not easily deceived, and valued justly all the specimens that rewarded his explorations. These began in his youth, when, with Dr. Davis, he so thoroughly explored the mounds of Ohio, and were continued for years. His researches were extended to various parts of the continent, and the collection now acquired by the American Museum is rich not only in specimens from the excavations in the tumuli of the Mississippi Valley, but also in articles of still greater variety and range from various parts of Central America, many of extreme value and interest. The Mexican part is also valuable, embracing probably the finest collection of chalchihuitl in the world. The extremely curious museum of antiquities collected in his two years' exploration of the ancient Peruvian seats of power, gives an insight into the whole life of that people, their food, dress, habits, employments, amusements, industry, and war. The ethnologist, finally, can study in h's

collection of skulls the intellectual development and capacity of the various races whose remains enable us to determine so nearly their position in the scale of civilization. The Museum has made a most important addition to the nucleus of a department of American antiquities which it had already created.

## MR. BANCROFT'S TENTH VOLUME.*

WITH his tenth volume, Mr. Bancroft has reached the Treaty of Peace of 1782, which recognized the independence of the United States; and it is announced that with this volume his work is at an end. He originally contemplated bringing his history down "to the present time," and if he has stopped at an earlier period, it is not that he overrated his strength, but underrated the richness of his materials and the proportions of his work. No doubt he would have been quite satisfied then with the prospect of ten solid octavos, which should cover the whole ground of his original plan; he may be even better satisfied with the industry and the fulness of materials which have found the ten volumes scarcely enough for so much shorter a space of time. It is perhaps too early to ask what will be the permanent rank and value of this history of the United States. Certainly, if it had been carried out according to its original plan, it must have superseded all others as a complete and detailed history. As it is, even conceding to it this rank for the period it covers, it must yet suffer by reason of its incompleteness; and those who wish to have one work which shall cover the whole ground must still content themselves with Hildreth's dry but compendious, accurate, and impartial work, or some other even briefer.

In matter of detail, we suppose that it would be generally admitted that Mr. Bancroft is less satisfactory in military operations than in other branches of his subject. Diplomacy is no doubt his favorite field, and the fulness and excellence of this may be pronounced the characteristic feature of his history as compared with others. In the present volume—which, to be sure, contains the negotiations for peace, but which also contains the Southern campaigns of Gates and Greene, the affair of Stony Point, the career of John Paul Jones, Arnold's treason, and Clarke's campaign in the valley of the Ohio—thirteen chapters out of twenty-nine are devoted to the relations of European states towards each other and towards this country. This is a great merit, even if it is somewhat exaggerated in its proportions. It was to most Americans an entirely new idea that the independence of their country was so closely connected with the intrigues of European courts. In this branch of enquiry Mr. Bancroft has had rare opportunities of study; he has had that most valuable of all opportunities, active and successful participation in diplomatic affairs; and it is not too much to say that these chapters of his work are an absolute contribution to our knowledge, and that of a very high order and very great in amount. This history of the Revolution contains a tolerably complete history of contemporary European diplomacy. Diplomatic history, however, is only one branch of political history; and we should expect that Mr. Bancroft would be equally strong in all departments of political history. He possesses the intellectual qualifications for it; but in dealing with affairs near at home, he lacks the temperate impartiality which does not desert him in the courts of Europe. No judgment passed upon his merits as an historian can be silent as to the storm of adverse criticism excited by his ninth volume. It was shown, we should think, very conclusively that in this volume he made unjust and untrue accusations against some of those men whose good name is a part of the national inheritance. But Mr. Bancroft has chosen to let these criticisms stand unanswered, neither refuting them nor acknowledging himself in the wrong. Now, this is not the temper nor the mode of proceeding of an impartial historian; and with this temper, however great the capacity of any one to deal with political transactions, it is impossible for him to possess that power of inspiring confidence which is the dearest treasure of the historian, and which he must possess if he would rise above the rank of pamphleteer.

Another fault, or rather perhaps another phase of the same fault, is that Mr. Bancroft is something of a doctrinaire, and writes from the point of view not merely of a theory but of a partisan theory. If Mr. Hildreth is, in a certain sense, the historian of the Federal party, Mr. Bancroft is in a much fuller degree the historian of the anti-Federal party. His theory of democracy is the French theory of the "rights of man," rather than that of English and American democracy based upon historical precedents and traditions. At the time that his earlier volumes appeared, the Jeffersonian theories of government, which had found embodiment and expression in the party of the Jackson Democracy, were sweeping triumphantly over the country. In the enthusiasm of his youth, Mr. Bancroft attached himself to this party, and made himself one of its intellectual leaders. His earlier volumes are written from the point of view of these theories, and may almost be called a panegyric upon them. Few, however, will be inclined at the present day to deny that this tide of radical democracy, culminating in the New York Constitution of 1846, was a chief cause of the political decay of the times that followed; and a history of the country based upon this theory can hardly be recognized as the true and complete delineation of the national development. It must be said that in his later volumes he has given less expression to this view of democracy, and that in especial the present volume contains fewer sounding generalities than are characteristic of the earlier ones. Perhaps, however, this may arise from the general character of the volume, which is written with far less spirit than is usual with him. It seems as if he had made up his mind to reach a definite point of time in his tenth volume, and had therefore crowded into it more material than he could well manage. His seventh and eighth volumes cover each about the period of a year, the ninth less than two years, while the one before us embraces from May, 1778, to November, 1782. No wonder, then, that it is comparatively dry reading; one cannot help feeling that the author was tired of his work and hurrying to get it finished.

This is not in general a fault of Mr. Bancroft's writing. Whatever shortcomings he has as an historian, dulness is not one of them. He is even accused of sacrificing truth to rhetorical effect; and whether this be so or not, it is certain that he sometimes sacrifices good taste to effect. But the present volume contains very little that is eminently characteristic of his style, whether in its merits—brilliancy and elaborate picturesqueness; or its defects—overloaded ornament, a fondness for sententious generalities, and an occasional obscurity arising from it. A specimen of the latter is the sentence on page 347, the precise meaning of which it is not easy to make out, and which at best adds nothing where it stands: "Yet the quality of our kind is such that government cannot degrade a race without marring the nobleness of human nature."

In his best style, we find this striking though florid description of the Mississippi, as the bond of American Union:

"The Mississippi River is the guardian and the pledge of the union of the States of America. Had they been confined to the eastern slopes of the Alleghanies, there would have been no geographical unity between them, and the thread of connection between lands that merely fringed the Atlantic must soon have been sundered. The Father of Rivers gathers his waters from all the clouds that break between the Alleghanies and the furthest ranges of the Rocky Mountains. The ridges of the eastern chain bow their heads at the north and at the south; so that, long before science became the companion of man, nature herself pointed out to the barbarous races how short portages join his tributary rivers to the shore of the Atlantic coast. At the other side his mightiest arm interlocks with the arms of the Oregon and the Colorado, and by the conformation of the earth itself marshals highways to the Pacific. From his remotest springs he refuses to suffer his waters to be divided; but, as he bears them all to the bosom of the ocean, the myriads of flags that wave above his head are all the ensigns of one people. States, larger than kingdoms, flourish where he passes; and, beneath his step, cities start into being, more marvellous in their reality than the fabled creations of enchantment. His magnificent valley, lying in the best part of the temperate zone, salubrious and wonderfully fertile, is the chosen muster-ground of the most various elements of human culture, brought together by men summoned from all the civilized nations of the earth, and joined in the bonds of common citizenship by the strong, invisible attraction of republican freedom. Now that science has come to be the household friend of trade and commerce and travel, and that nature has lent to wealth and intellect the use of her constant forces, the hills, once walls of division, are scaled, or pierced, or levelled; and the two oceans, between which the republic has unassailably intrenched itself against the outward world, are bound together across the continent by friendly links of iron."—P. 192.

Another passage, at once characteristic and good, is the contrast drawn between the New Constitution of Massachusetts (1780) and the plan of government for "New Ireland"—the territory between the Saco and the St. Croix. "The one," he concludes, "would have organized self-government, the other arbitrary rule; the one a people of freeholders, the other of landlords and tenants; the one public worship according to the conscience and faith of individuals, the other a state religion subordinate to temporal power; the one education of all the people, the other indifference to human culture" (p. 369). An interesting story is told (p. 527) of John Adams in his negotiations which resulted in the acknowledgment of American independence by the Netherlands: "Encouraged by the success at Yorktown, on the 9th of January [1782] he presented himself to the President of the States-General, and renewing his formal request for an opportunity of presenting his credentials, 'demanded a categorical answer which he might

* 'History of the United States, from the Discovery of the American Continent. By George Bancroft.' Vol. X. Boston: Little, Brown & Co. 1874. 8vo, pp. 593.

transmit to his sovereign.' He next went in person to the Deputies of the several cities of Holland, following the order of their rank in the confederation, and repeated his demand to each one of them. The attention of Europe was drawn to the adventurous and sturdy diplomatist, who dared alone and unsustained to initiate so bold and novel a procedure." We will close with an extract from a foot-note (p. 349), which we may be allowed to hope hints at Mr. Bancroft's future field of labor. If he has given up the plan of a complete history of the United States, this need not be inconsistent with its continuation upon its diplomatic side, which he has made so peculiarly his own. "The despatches of the French envoys to their Government contain the most complete reports which exist of the discussions in Congress from 1778 to the adoption of the Constitution in 1789. Congress sat, it is true, with closed doors; but the French Ministers knew how to obtain information on every proceeding that interested their country."

## ISMAILÏA.*

SIR SAMUEL BAKER'S narrative, except for its extreme redundancy as a piece of book-making, reads like the story of a new Cortez or Pizarro. The Khedive furnished him a military force of upwards of two thousand men, with artillery in proportion, and apparently unlimited funds for the purchase of supplies, including all the materials for constructing iron steamers, and was, Sir Samuel Baker affirms, sincere in wishing for the success of the expedition; but he was extremely ill-seconded by all his officials and local functionaries. These people did everything to make it abortive. The expedition on leaving Cairo must have presented the appearance of some vast fantastic squadron out of Spenser or Ariosto—the dusky soldiers of every shade clad in crimson and white, the group of fair Englishmen headed by the stalwart Pasha and his devoted wife, and the great baggage-train of strange machinery and gaudy presents and bribes for the savages. The whole force and its impedimenta were easily transported to Khartum, the last outpost of civilization on the upper Nile; but after leaving this place its troubles began and lasted with little intermission for more than two years. The first year (1870) was passed in struggling with the so-called "sudd" of the great river—the floating islands of vegetation with which the stream in certain latitudes is choked. It forms itself into masses so compact and resistant that the work of forcing a passage is about tantamount to digging a canal. The party dug its canals in vain, the boats wriggled through impossible places only to find themselves confronted with the absolute solidification of the stream, and had to retrace their course with all possible speed, lest their canals should solidify behind them. They erected a little city of canvas by the river side, and waited till the next year brought back high water. Another trial met with better success, and they at last found their way along tangled threads of water, through a series of bewildering lakes (like a string of scattered beads) until Sir Samuel Baker in a small boat squeezed forward and ushered them into the open current of the White or uppermost Nile. Troops and boats got through, and after this were fairly landed in the equatorial wilderness. "Wilderness" is indeed not the word; for most of the country that Sir Samuel Baker traversed is thickly populated, and his usual formula of praise is to say that it reminds him of an English park. The population, to be sure, consists of naked and bloodthirsty savages, and the beautiful trees on the lawn-like slopes are very apt to have one of these gentry lurking behind them; but at any rate it is not the forest primeval; there is society, though the society is disagreeable.

We cannot of course follow the expedition in detail; but it arranges itself in three or four broad masses. These are subdivided into innumerable episodes and incidents; for Sir Samuel Baker is a very minute historian. There is of course a fair share of sporting episodes, though of these the author is somewhat chary, as he pretends to speak only of what befell him in his official capacity. But his shots apparently were as marvellous as ever; he picks out the soft spot of his victim to within a hair's-breadth, and his bullet keeps the appointment. There are various arrests and overhaulings of slave-trading and kidnapping parties, with immediate emancipation of the victims, and, on one occasion, wholesale marriage of the women to his own Abyssinian soldiers. Then there are the fighting episodes, which are intensely interesting, and in which Sir Samuel Baker comes out, as the phrase is, very strong. These pages constitute the originality of the present volume, which on several other points contains less curious information than its predecessors. Owing to the author's remaining of necessity in the populous regions there are fewer wild-beast stories; though, indeed, this hardly matters, for the natives were, for the most part, as perfect wild beasts as the steadiest nerves could have cared to encounter.

Sir Samuel Baker made a long halt at Gondokoro, in the country of the Baris, a race whom his utmost forbearance and tact were utterly powerless to propitiate. It was living on pins and needles, but every one, on the whole, seems to have done his duty, and the Baris, in their thousands, were at last soundly thrashed by the English Pasha and his handful. It was literally a handful, for the force had been seriously reduced by death, desertion, massacre, and dispersion on other errands. The bulk of the original troops were very reluctant philanthropists, and had to be vigorously weeded and sifted, so that the toughest work was performed by a handful of seasoned and tested men. In the autumn of 1871, while he was away from Gondokoro, in an expedition against the Baris, eleven hundred men withdrew and started on the return journey to Cairo. He was thus left to suppress the slave-trade and fight the savages with a force of only five hundred persons, which was afterwards considerably reduced. His only resource was to make the quality of his little army very perfect, and it appears to have become, indeed, a small but admirable machine, of which he was the irresistible motive power. The Baris insisted on war, began it in a terrible fashion, but were promptly satisfied and utterly dispersed. How he proceeded afterwards to the country of the Loboré, who were, relatively speaking, mild and polite, and made his way with many adventures into the kingdom of Unyoro, Sir Samuel Baker relates in copious detail His establishment in this country, where he constructed an elaborate government station, unpacked his goods, and endeavored to diffuse the civilizing influence of lawful commerce, is one of the most interesting episodes in his volume. It had a terrible termination, but one feels morally sure of the author as one reads, and it only deepens one's pleasure to feel the plot thickening in a sinister manner. The people of Unyoro have a smattering of civilization, and their young king, Kabba Rega, esteemed himself a mighty potentate. His is a very vivid and entertaining portrait, and the whole story of his relations with Sir Samuel, his pomposity, his greed, his drunkenness, his cruelty, and his final treachery, has a fine dramatic completeness. The little army was encamped alongside of the town of Masindi, where it had made itself, for the time, a very comfortable home, and established relations, ostensibly of a very friendly kind, with the natives. But a massacre had been planned, and it was attempted with a suddenness which left the strangers barely time to spring to arms. An attempt had first been made to poison the garrison, which was successful to the point of making half of them deadly ill, and Sir Samuel Baker had only just ceased plying them with emetics and rejoicing in the consequences, when a chorus of inhuman yells suddenly expedited their convalescence. The natives, of course, were repulsed and chased, and their metropolis was given over to the flames. Sir Samuel Baker then set fire to the government station and to the greater part of his own provisions, and, making a few small packages of all that remained of his once voluminous baggage, without guides, without beasts, without carriers, he began a desperate retreat through the wilderness. This episode is of really thrilling interest; it was the distinctively heroic part of the expedition. There had been a horse and a donkey left; but they both died, and Lady Baker performed the march on foot. This was only one more prodigy of fortitude on the part of this extraordinary woman. Day after day they advanced, fighting their way hour by hour against the ambushes of the defeated and infuriated enemy. They found refuge at last in the dominions of Rionga, a friendly potentate and apparently very amiable man, inhabiting an island in the great Victoria Nyanza.

Here the term of Sir Samuel Baker's commission approached, and he was obliged soon to set out on his laborious return to Khartum. We have been able to give but the scantiest outline of his narrative, which we cordially commend to all admirers of men of action. We have said nothing of his operations against the slave-traders, which were as energetic as opportunity allowed, and which effected, in particular, the arrest of Abou Saood, the principal agent of the horrible traffic. He comes and goes, throughout the narrative, as the evil genius of the expedition and the blight of all Sir Samuel Baker's beneficent projects. Sir Samuel sent him to Cairo to be tried for his crimes; but he admits that the grand fault of his expedition was that, once having caught him, he did not summarily shoot him. Abou Saood was acquitted, released, and sent back to the White Nile. Sir Samuel Baker had done a great deal in the way of "annexing," and another Englishman, Colonel Gordon, was subsequently sent to Equâtorial Africa to emphasize the solemnity. As yet it is a matter of unfurling the Ottoman flag and stealing the likely young people. Was the Khedive sincere, or did he merely wish to make an impression of philanthropic zeal upon the European powers? In either case, Sir Samuel Baker has had his fling, and if the poor victims of Abou Saood and Company have not permanently pro-

* 'Ismailia: A Narrative of the Expeditions to Central Africa for the Suppression of the Slave Trade, organized by Ismail, Khedive of Egypt. By Sir Samuel Baker, Pasha, etc.' New York: Harper & Brothers. 1875.

fited, one may say that the Anglo-Saxon public has. There was something essentially fabulous and chimerical in the elements of the enterprise, and if the Viceroy of Egypt was really laughing in his sleeve as it went forward, this only gives the last dramatic touch to the affair. But if we were to take this view, we might still hope in charity that he was not sorry to have given a man who was a magnificent example of the classic personal qualities of the English race, a magnificent opportunity to display them.

## THE MARINE MAMMALS OF WESTERN AMERICA.*

LESS than a decade ago, the marine mammals, and especially the cetaceans of the western coast of North America, were almost less known than those of any equal extent of coast in any other portion of the world. Now they are among the best known (and scarcely, if at all, less so than those of Eastern North America), and for that knowledge we are chiefly indebted to the labors of one man, who, as a diversion from official duties, directed his attention to their observation and illustration. It is to Charles M. Scammon, a captain in the United States Revenue Marine Service, that our obligations are due.

"Being on the coast of California in 1852, when the 'gold fever' raged," says Captain Scammon, "the force of circumstances compelled me to take command of a brig, bound on a sealing, sea-elephant, and whaling voyage, or abandon sea-life, at least temporarily. The objects of our pursuit were found in great numbers, and the opportunities for studying their habits were so good that I became greatly interested in collecting facts bearing upon the natural history of these animals. Reference to the few books devoted to the subject soon convinced me that I was at work in a department in which but little definite knowledge existed. This was true even of the whales, the best known of this class; and I was soon led to believe that by diligent observation I should be able to add materially to the scanty stock of information existing in regard to the marine mammals of the Pacific coast."

The studies thus commenced were continued with unintermitted ardor during the succeeding years, and their results are made known in the work now under notice. Meanwhile, however, species represented in the Californian waters had been described by Gill and Cope, and Captain Scammon himself had, in one of several articles, given the fruit of some of his observations in a paper which was edited by Prof. Cope, and published in 1869, in the Proceedings of the Academy of Natural Sciences of Philadelphia (pp. 32–63). This article, with some modifications, has been embodied in the new work whose title is given in connection with this notice, but the greater part of the volume is composed of new matter.

How interesting and fruitful the studies of Captain Scammon have been may be gathered from a few facts. As already indicated, scarcely anything was known before he commenced his investigations respecting the cetaceans of the western waters, and now we have the goodly array of twenty-four species of that order duly registered in the roll of forms dwelling in the Pacific. Several of these, it is true, are very incompletely known, but it is quite possible that the names personating them represent distinct species whose exact determination awaits the future investigations to which Captain Scammon, it is hoped, will devote himself.

Seven species of whalebone whales (Mysticete or Balænoidea), the sperm whale (*Physeter macrocephalus*), and sixteen nominal species of porpoises and allied forms (Delphinids), are recognized by Captain Scammon as inhabitants, for a greater or less portion of the year, of the waters in question. The most interesting form is the gray whale (*Rhachianectes glaucus*). This species was entirely unknown to science before specimens were secured by Mr. Dall and described by Professor Cope in 1868. Its habits were subsequently given in more detail by Captain Scammon, and the account is reproduced with additions in the new work. Not only does the species belong to a distinct genus from any previously known, but it represents, in common with the Scrag whale of our eastern waters, a peculiar group of fin-back whales (Subfamily Agaphelinæ), distinguished by the absence of a dorsal fin and the reduction of the inferior folds to at most two longitudinal ones under the chin; these folds, in the gray whale, are about fifteen inches apart and six feet long. The species is also very characteristic in its color, being of a mottled gray. It attains a length of about forty feet, and may, perhaps, exceptionally reach even fifty. In habits it differs from all other species. In the colder months (from November to May) it is found in the Californian waters, and in that season the female enters the lagoons and brings forth her young. As the season advances, they all proceed northwards, keeping so near the shore that they often pass through the kelp near the beach, and the warmer months are passed in the Arctic Ocean and Sea of Okhotsk. "Devil-fish," "hardhead," "grayback," and "rip-sack" are names given to the animal, and suggest various peculiarities. The first is significant of the danger incurred in its pursuit; the second alludes to an unpleasant propensity to "root" the boats when coming in contact with them, in the same manner that hogs upset their empty troughs; the third alludes to the color, and the fourth to the mode of flensing adopted by the whalers. "Mussel-digger" is a misnomer, resulting from its manner of descending into the mud and returning to the surface with snout besmeared with mud, giving rise to the inference that it had been in search of mussels. It affects the shallowest water (especially when the "cubs" are young), and delights in the breakers along the beach, or keeps between the shore and kelp. This habit determines the mode of pursuit generally adopted. The vessels are anchored at a distance from the shore, and at early dawn the crews advance inwards to the attack in boats, or await, at favorable openings, the emergence of the animals from the beds of kelp. Another mode of capture is by ships cruising off the land and sending their boats inshore toward the line of kelp, and, as the whales work to the southward, the boats being provided with extra large sails, the whalemen take advantage of the strong northerly winds, and, running before the breeze, sail near enough to be able to dart the hand-harpoon into the fish. "Settling fast" in this way, it is killed in deep water, and, if inclined to sink, it can be held up by the boats till the ship comes up, when a large "fluke-rope" is made fast, or the "fin-chain" is secured to one fin, the "cutting-tackle" hooked, and the whale "cut in" immediately. This mode is called "sailing them down." Still other ways of attacking them are with "Greener's harpoon-gun," which is similar to a small swivel-gun, and what is called "whaling among the breakers," the latter being a modification entailed by the greater wariness which the animals have learned through the lessons of experience. While the fishery for this species which most interests our own citizens is that carried on in the Californian waters, it is not the only one. At favorable localities along most of the coast, from their southern limits to the Arctic Ocean, during their passage between summer and winter quarters, they are assailed by the inhabitants, and their arrival is awaited for with eager expectancy. This constant onslaught has made the species more cautious, and even induced a modification in its habits; it more and more shuns the fateful shore, none are found as large as formerly, and it appears now in diminished numbers. Thus much has been deemed advisable to recount of a form so peculiar and isolated in distribution; the others must be passed over in silence.

As is well known, it is among the cetaceans that are to be found the most gigantic of living animals, and large-sized forms are characteristic in the group of whalebone whales: their huge size, although it may be definitely stated in feet and inches, is rarely adequately conceived of by the mind. Some are said (but it may be well to receive the statement with much doubt) to attain a length of more than one hundred feet. A few data will illustrate the size which some species attain. Commencing with the best known type, the Bowhead, or Great Polar Whale, has been said to yield nearly three hundred barrels of oil and over thirty-five thousand pounds of whalebone, and it might therefore be supposed to be the largest of all cetaceans. Such, however, says Captain Scammon (and his remarks have a *naïve* appearance) is not the fact, for it seldom attains the length of sixty-five feet, and it is a stout whale which measures fifty feet between its extremities. It is among the finback whales that at least the *longest* species are found, the sulphur-bottom attaining a length of from eighty-five to ninety-five feet, and its weight is estimated at nearly one hundred and fifty tons. The smallest of the whalebone whales (*Balænoptera Davidsoni*), and which, on that account, has been supposed to be the young of some other, attains the length of nearly thirty feet. The young, or "calves," when born are about a quarter as long as their dams, and one of the most interesting plates in Captain Scammon's work is that illustrating a female suckling her young: the teats are situated almost two-thirds of the entire distance from the snout; one of these is taken by the young between the extremity of its jaws and lips, while the mother reclines a little on one side, raising her hind parts nearly out of the water, and lying in a relaxed position.

In addition to the cetaceans, Captain Scammon has also treated of the Pinnipeds and the sea-otter of the Pacific coast. He has added somewhat to the previously known details respecting some of these species, but has been by no means as fortunate as in respect to the cetaceans. In his work is, however, for the first time, given a figure of the Californian sea-elephant (*Macrorhinus angustirostris*), and his previous account of it is reproduced with slight modifications. The great interest attached to these forms is

* 'The Marine Mammals of the Northwestern Coast of North America, Described and Illustrated; together with an Account of the American Whale Fishery. By Charles M. Scammon, Captain U. S. Revenue Marine.' San Francisco: John H. Carmany & Co. New York: G. P. Putnam's Sons. 1874. 4to.

'Report on the Prybilov Group or Seal Islands of Alaska. By Henry W. Elliott, Assistant Agent Treasury Department.' Washington: Government Printing Office. 1873. 4to.

evidenced by the large number of publications respecting them which have emanated from the press within the last few years. It must be distinctly understood that Captain Scammon's work is only full in respect to the species of this group found in California, several other forms being inhabitants of the northwest regions. The author's statements must convey an erroneous idea respecting the relations of the several animals. The northern fur-seal, for instance, is very different from the fur-seals of the southern hemisphere, and is alone entitled to the name *Callirhinus ursinus*. Under the name sea-lion are also confounded two very distinct species, it now appears, and to Mr. Elliott is due the credit of having first pointed out the difference in external appearance; one of these is the great sea-lion common also in the northern seas (*Eumetopias Stelleri*), and the other a smaller species (*Zalophus Gilliespii*) which appears to be common to the temperate regions of Western America and Eastern Asia (Japan, etc.), but not to advance northwards. Still more, this *Zalophus Gilliespii*, of which till very lately only a single skull was known to be extant in this country, turns out to be the "sea-lion" that has been on exhibition in collections of living animals in this country, and notably Barnum's and Woodward's, and which were obtained in California. But, strangely enough, all the skeletons and skulls hitherto sent from California to museums in this country and Europe (and they have been many) belong to the larger species. This *Zalophus* may be readily distinguished externally from the *Eumetopias* by the much smaller size, the much larger and differently colored eyes, the slender muzzle, the darker color, and the voice which, according to Mr. Elliott, is a "honking" bark, while that of the *Eumetopias* is "only a deep bass growl and prolonged, steady roar." There are considerable discrepancies between the accounts of Captain Scammon and Mr. Elliott respecting the habits of the fur-seal and sea-lion, and both must be consulted before safe conclusions can be reached. The seals found on the Californian coast are (1) the common one—*Phoca Pealii*—(which may be only a variety of P. vitulina); (2) the sea-elephant—*Macrorhinus angustirostris*—(which is now nearly extinct); (3) a large sea-lion—*Eumetopias Stelleri;* (4) a small sea-lion—*Zalophus Gilliespii;* and (5) the fur-seal—*Callirhinus ursinus*. The ascription of the banded seal (*Histriophoca equestris*) to California is doubtless the result of erroneous identification by Captain Scammon, and the walrus (which, as Mr. Elliott has recognized, is a distinct species from the Greenland animal) has not been found south of Alaska. The sea-otter is a form related to the common otter, and belongs to the same family.

On the whole, Captain Scammon's work is a very valuable one, especially in the illustrations (most of which have been drawn by himself from nature and after exact measurements), and in the biographical accounts of the several species. It is, however, deficient from a scientific standpoint, no precise comparative descriptions being given of the species, and little regard having been observed in the systematic arrangement of the various forms. Attention to these points would have much enhanced the value of the work, and the more so as it is addressed to readers who have not ready means of acquiring the requisite information. Exactness in generalization is indeed a requisite in scientific work, and any publication must lose value to the extent of neglect of such matters. It was, for example, rather culpable to have given the sequence adopted for the species of Pinnipeds, in which the several forms follow in arbitrary confusion, and in which the sea-otter (which is structurally a modified weasel, and has no near relation to the Pinnipeds) is interposed between the common seal and the walrus. Notwithstanding such faults, however, our author's work marks an epoch in cetology, and will be a standard one in the history of that branch.

Mr. Elliott's work is an official report, made by him as an assistant agent of the Treasury Department, printed in a very unofficial and unusual manner, the form externally being an ordinary quarto, while the text extends from the bottom to the top of the form, and is not paged; there are sixteen and a half folios, and fifty plates photographed from original paintings by the author. Much interesting matter respecting the eared seals (as well as the resources of the Prybilov Islands) is contained in it, and it is to be regretted that it is practically unattainable, as an edition of only one hundred copies was printed, which have been distributed where they will be of least use—to those at least who will desire to consult them—and no copy exists even in the National Library.

---

*Dictionary of Practical Phonography.* By James E. Munson. (New York: Hurd & Houghton. 1875.)—We are much mistaken if the manifest destiny of this work is not to give an appreciable impulse to the study of phonography, not alone nor perhaps chiefly for the purposes of reporting, but for private convenience in the abridgment of literary labor. What, after the conflicting systems and complicated rules of the different teachers of short-hand, has most deterred would-be learners has been the lack of a standard by which to revise their transcriptions. An instructor, of course, could do this, but he is not always to be had, and must be paid when he is. Those who have aimed, like Mr. Munson, to popularize phonography as an auxiliary, or even as a sole and universal, script, had placed before them the task of making every pupil his own instructor; and this Mr. Munson has, by means of his several works, nearly accomplished. His Dictionary, with its sixty thousand words in familiar use and five thousand proper names, now enables the student to write correctly, or at least to judge of the correctness of what he has written. The reporter's proficiency can of course only come through long and assiduous exercise. The practical difficulties of a dictionary have been satisfactorily overcome by Mr. Munson, who has devised a stenographic representation capable of being at once transcribed into phonographic characters. *Perfidiousness*, for example, is thus outlined: Pr$^3$-F-Ds-Ns; *peninsulate*, Pn$^3$-N-*SH*$^1$-T, or Pn$^3$-N-s*Lt*; *ligation*, *L*$^2$-Gshn; *faux pas*, F$^2$-P; *smart-money*, sM-Rt$^1$-M-N, etc., etc. The compactness of this system is manifest, and in fact the vocabulary is contained in 328 pages of good, clear type. The preface furnishes interesting reading. It gives a history of the invention and gradual perfection of phonography, compares other schools with that which is identified with the author, and sets forth the signs and abbreviations on which the author's system is based, and the mode of interpreting their stenographic equivalents. The "new Phonography," as Mr. Munson styles it, is "now being taught with success in many schools, and notably in the Introductory Class in the College of the City of New York, where it has been a regular branch of the commercial course for the last three years (since the fall of 1871)." We hope that in the second edition of his Dictionary he may be able to point to many other instances of its adoption in schools. A primer of phonography is perhaps still needed; at least very young children might master the simple stems and hooks, and the outlines of a selected vocabulary.

*Manual of Mythology:* Greek and Roman, Norse and Old German, Hindoo and Egyptian Mythology. By Alexander S. Murray, Department of Greek and Roman Antiquities, British Museum. Second edition, rewritten, and considerably enlarged. With fifty-five plates. (New York: Scribner, Armstrong & Co.)—So far as Grecian mythology is concerned, Mr. Murray's 'Manual' is nearly all that could be desired. It is brief, and at the same time complete—we have looked for very few names, even of inferior importance, without finding them—clearly written, and, in the main, well arranged. As to the point of view, it follows the prevailing system of spelling (Hephaistos, Herakles, etc.), and gives as much of the now accepted theory of mythology as it is worth while to present to schoolboys. The index appears complete, but is not very convenient for use. A really good index ought not merely to state every place where a name is to be found, but to distinguish them in some way, if only by indicating where it is a principal topic and where it is only incidentally mentioned. The common run of school-boys, looking out "Iphigeneia," for instance, and finding five different pages referred to, can hardly be expected to turn to three out of the five before finding the complete story looked for. Good as the book is, however, for Greek mythology, as well as for Eastern and Northern, for Roman mythology it is almost worthless. The author seems to know enough of the Roman gods to avoid using their names for Greek divinities, but not enough to realize in the slightest degree the contrast between the religious systems of the Greeks and the Romans. The very title of the book confounds the two. Not only is there no attempt, or but a very lame one, to analyze and explain the points of difference between them, but the Roman mythology, so far as it is introduced at all, is treated in the most slipshod and inaccurate way. Generally, a paragraph at the end of each section is devoted to the Roman counterpart of the Greek god. Some, times this answers very well in detail, as in the case of Juno, Neptune, Vulcan, and Mars. Even at the best, however, this method conveys no adequate notice of the Roman religion as a whole, and in several cases it gives a positively wrong impression. It is, for instance, a mere accident—the identity of the sickle as an attribute—that connected Saturn with Kronos; and there is hardly more connection between Venus and Aphrodite, Diana and Artemis, Liber and Dionysos, Mercury and Hermes. Of Diana the astounding assertion is made (p. 116) that her worship "appears to have been of native growth, and not, as was the case with that of many of the other deities, imported from Greece"—as if nearly every deity except Apollo and Bacchus was not native, although buried beneath the attributes and traditions of their Grecian counterparts. What Roman deities should be described seems to have been a matter of haphazard. Janus receives quite adequate treatment, although he is classed among the "Inferior

Deities"; but there is not a word of Quirinus, Consus, Feronia, Bona Dea, Dius Fidius, or Mater Matuta—deities quite as important, in the native Roman Pantheon, as Ceres, Liber, Mercury, or Venus; and Flora, so ancient and important a goddess that she had a flamen of her own, is only brought in as corresponding to the Greek Chloris. And what is strangest of all is the order of these "Inferior Deities," Greek and Roman being mixed together utterly at random—Pan, Faunus, Picus, Fauna, the Satyrs, Silvanus, Pales, Silenos, Okeanos, Nereus, etc.

The illustrations are, generally, selected with good judgment, so as to make the student familiar with some of the best and most instructive specimens of ancient art—such as the Jupiter of Otricoli, the Ludovisi Juno, the Diana of Versailles, and the Venus of Milo. The engraving is effective, although not always sufficiently clear and delicate. It is a great defect that the authority for each figure is not distinctly given. A valuable feature is, that at the end of the several divisions is "added, in smaller type, an account of the most memorable works of art in which each deity is, or was, represented."

# Fine Arts.

## THE WATER-COLOR EXHIBITION—LOAN EXHIBITION OF THE UNION LEAGUE.

THE eighth exhibition of the American Society of Painters in Water-Colors opened on Monday, the Academy rooms being lined to repletion with the works. The walls, covered with the small, even, low-relief frames usual for water-colors, looked beautifully regular and dense; much better, as regards the becomingness of their furniture, than they do in an exhibition of oil-color pictures. But we have never been able to comprehend the reason why aquarelles, as if by a necessity of their being, must be framed in bas-relief and with vast flat mats. We have never understood why the coast-scene of Hoguet, say, or Kuwasseg, when executed in oil, must be thrown back in a very deep frame, with the look, if it is small, of being seen at the end of a sort of golden tunnel; while the same scene, if we suppose it copied in water-color with exactly the like chiaroscuro and value, must be thrown up to an entirely different focus, surrounded with the flattest of slats, and blind-haltered with a blazing space of raw white all around it, somewhat suggesting in the whole arrangement the iris of a near-sighted eye. We suppose that it would be heterodox not to submit, since our native Water-Color Society has raised the theory to the sanctity of a dogma in its recent circulars of instruction; but we feel, retaining pensively the right of private judgment, that each picture an artist paints is a rule unto itself and unto its arrangement; that the frame should express the necessity, the proper relief, and, as it were, the complement of each separate *motif* the painter completes; that the framing should cap the picture with all the individuality and liberty of a dress on a beautiful human being; and that there can hardly be a more fatal criterion of the dull, uninventive *moutonnière* spirit of all of us—artists, buyers, and professors—than a ruling which trims the pictures in our parlors in a fixed and wholesale style, primarily dictated by the chisels and gouges of the moulding-maker. In our opinion, the utmost latitude should be allowed for the caprice of artists and for the prejudices of connoisseurs: many of the latter hate margins, and frame their Callot or their Kaulbach without any edge at all; and there is no reason why they may not be quite right. Charles Lamb doubtless loved the narrow black frames around his line of Hogarths, and would have been distressed to see them decked off in another taste. The liberty of perfect adaptation should, in fact, be allowed to every sort and description of cartoon or paper picture—a species which includes the widest variety of all and the greatest ups and downs of effect.

The present exhibition represents the eighth year of the Society's existence, and displays surprising strength for so young an organization. They have been going on for these fifty months in a mission of propagandism, with a good deal of sacred crusading zeal, and at each yearly exhibition they display a new flock of converts, plucked directly from the ranks of oil-painting. It is rather surprising that the artists in oil, accustomed to the ease of a direct, *heurtée* touch, can generally adapt themselves so soon to aquarelle, which is usually a method of floatings and washings, of wet and rotting substance, and of gradations obtained by a system of repeated glazes, apt to be fatal to outline and precision. The landscape artists are of course the most successful. The exhibition contains a varied and delicate selection of beautiful scenes, by artists so favorably known as Richards, Nicoll, and Bricher, Edward Moran, Smillie, Bellows. The figure-paintings, however, are by no means wanting, and include such noticeable works as the Shaksperian subject by Fredericks, the pastoral by Magrath, the compositions of Mrs. Stillman and Mrs. Elizabeth Murray, and the abundant and always healthful work in this line of Mr. Homer. Noticeable, again, and always comely and becoming in a water-color exhibition, are the numerous decorative pictures, such as those of Miss Fidelia Bridges, where the composition, at first sight as purely and elegantly decorative as a good wall-paper design or a Japanese fan, is invariably found to contain some sentiment, lesson, or poem; or the delicious flower-groups of Mr. Lambdin. Aquarelle is a method of art which goes to the adornment of homes, and it partakes largely of the spirit of a decoration or object of furniture; it is more agreeable in proportion as it frankly confesses this quality, leaving to oil the manufacture of great gallery pictures and pieces of didactic authority.

A rather unusual grouping of valuable paintings was observable in the hanging of the picture-gallery of the Union League for a reception last week. There were lent for the occasion a magnificent work by Fortuny, the "Snake-Charmers"; two Gérômes, the "Crucifixion" and the "Molière and Racine"; a large and typical specimen of Stevens, representing girls after a ball; the crowd of dwarfs by Zamacoïs, called the "Louvre under Henri III."; a Meissonier, very striking, and containing the unusual element of a female figure; a spiritual piece of Germanism by Max; and several other memorable pictures. The most valuable loans were made by Mr. A. T. Stewart.

*MESSRS. HENRY HOLT & CO.* have just ready a summary of African travel, compiled from the authorities from Herodotus to Livingstone, by C. H. Jones, and elaborately illustrated (8vo, $5); a second and thoroughly revised edition of Professor Adams's 'Democracy and Monarchy in France' (8vo, $2 50); and 'Mistress Judith,' a novel by C. C. Fraser-Tytler, which has been highly praised (16mo, Leisure-Hour Series, $1 25). They will very soon publish Sir Henry Maine's 'Early History of Institutions,' a continuation of the investigations begun in his 'Ancient Law.'

*HARPER'S CATALOGUE.* The attention of those designing to form libraries, or increase their Literary Collections, is respectfully invited to Harper's Catalogue, which comprises a large proportion of the standard and most esteemed works in English Literature—*comprehending over three thousand volumes.*

Librarians who may not have access to a trustworthy guide in forming the true estimate of literary productions, will find this Catalogue especially valuable for reference.

The Catalogue is arranged alphabetically by the authors' names, anonymous works by their titles. The index is arranged by the titles of the books, besides having numerous appropriate heads, each general head being followed by the titles of all works on that subject.

Harper's Catalogue sent by mail on receipt of ten cents.

Address HARPER & BROTHERS, Franklin Square, New York.

*THE ACROPOLIS OF ATHENS.*

A few views (by the autotype process) of the principal monuments of the Acropolis. Remarkably fine. Size, 15⅛ x 19⅛. Unmounted. Price $5 each. Address Publisher of the *Nation*.

*For "The Reader" on Sidgwick's 'Methods of Ethics,' Jardine's 'Psychology,' etc., and for Macmillan & Co.'s List of Books on Moral and Mental Philosophy, see page 86.*

*THE FINANCIAL REVIEW.*

This annual book gives a complete review of the year 1874 and a record of prices, as follows: Gold, 1862–1874; Foreign Exchange, 1867–1874; Government Securities, 1860–1874; State Bonds, 1860–1874; Railroad Bonds, 1860–1874; Railroad Stocks, 1860–1874. A list of railroads in default; dividend-paying railroads; land grants of the U. S.; mercantile failures in 1874; cotton crop report; cotton spinning; and other valuable articles, are among its contents.

WILLIAM B. DANA & CO., Publishers, 79 and 81 William St., New York.

*NEW YORK, THURSDAY, FEBRUARY 11, 1875.*

## The Week.

ON the 3d in the Senate, perhaps the most noticeable proceedings, in view of the tone of the President's message subsequently, were those relating to the resolution of enquiry as to Arkansas introduced by Mr. Clayton. The point to be remarked is, that the resolution, as it originally stood, called upon the President not only for information but "for such recommendations as he may deem proper," but on objection being made by Mr. Johnston of Virginia, who reminded Mr. Clayton that it was not usual to call upon the President for recommendations, he consented that this part of the resolution should be struck out, and it was struck out. The Grasshopper Bill passed by the House (a very queer bill, directing the President to distribute supplies to the sufferers) was referred to the Senate Military Committee; and Mr. Morrill of Vermont made a speech against the Canadian Reciprocity Treaty. In the House, on the same day, the Civil-Rights Bill made its appearance in charge of General Butler. There was a difficulty during the debate between Mr. McLean of Texas and General Butler, the latter referring to a certain class of people in the South as "banditti, horse-thieves, and assassins," and the former replying by saying that "the gentleman from Massachusetts was the only murderer that he knew on the floor"; the Speaker interfered, however, and preserved order. On the next day, in the Senate, Mr. Morton brought up the question of Presidential Elections in a new form, by moving an amendment to the twenty-second joint rule of the two Houses in the following form: "No objection to the reception and counting of any electoral vote or votes from any State shall be valid, unless such objection is sustained by the affirmative vote of the two Houses." In the discussion which followed, Mr. Morton said that there was no chance of the adoption of his constitutional amendment before the next Presidential election; but under the rule as it now stands any State might be thrown out by either House of Congress.

In the House on Thursday the Civil-Rights Bill discussion continued, and the session was enlivened by a speech of Mr. John Young Brown of Kentucky, who, it must be confessed, was decidedly unparliamentary in his language, and who was finally arraigned at the bar of the House and censured for his conduct. The House also agreed to the report of the Committee on Naval Affairs, acquitting Mr. Stowell of Virginia of having sold a cadetship. On Friday the death of Senator Buckingham of Connecticut was announced, and the customary proceedings of respect were voted. In the House the Civil-Rights Bill was passed with the school clause stricken out, and applying now only to inns, public conveyances, and places of amusement, by a yea-and-nay vote of a hundred and sixty-two to one hundred, and the bill went to the Senate as an original House bill, without any relation to the Senate bill already passed. In the Senate, on Saturday, Mr. Morton reported from the Committee on Privileges and Elections a bill to regulate the counting of Presidential votes, and the House bill to protect life on board steam-vessels was debated. On Monday, Mr. Morton reported from the Committee on Privileges and Elections a resolution declaring Mr. P. B. S. Pinchback entitled to a seat as senator from Louisiana. The report is only signed by four members of the committee, but it is presented as the committee's report, five making a quorum, and four a majority of that five.

The new rule adopted by the majority in the House of Representatives is not in itself very objectionable, yet to get it into its present shape was perhaps worth the filibustering resorted to by the Democrats. If, however, they had fought the proposed change by arguments, invective, or entreaty and prediction, they would not only have done all that duty required, but have done the very best thing for the interests of their own party. The main objection to the change in the rules is that the experience of many years is on the side of the old one, and that, if rules are to be changed, they ought to be changed in quiet times and in the general interest. This change has, however, been made in very exciting times, and avowedly as a weapon of party warfare. If it is allowed to stand in the next Congress, therefore, it will be in order that it may be used as a means of harassing or oppressing the minority, and thus of producing renewed disorders in the House. We are clipping out from Republican papers the passages in which they now approve of the new rule and of the manner of its adoption. We shall reproduce some of them this time next year, and think they will then prove amusing reading, by showing what is so often shown, and apparently with so little effect, the difference it makes whose ox is gored.

The prominent part played by Butler in pushing through the Civil-Rights Bill of course led to a great deal of violence in the debates, and to one very disorderly and yet very comic scene. A member from Kentucky, Mr. Brown, delivered himself of one of those elaborate pieces of vituperation, which the newspapers call "scathing," and which was plainly directed against Butler. Being asked, however, by the Speaker, whether it was aimed at any member of the House, the orator denied it, but closed by mentioning "Butlerism" as the object of his attack, which showed, as the Speaker rightly held, that he had secured himself against interruption by a piece of discreditable evasion. Thereupon there was a scene of wild excitement, which had, however, its ludicrous side, for in it Mr. Dawes, of all men in the world, appeared in the character of a stern, implacable, and resolute moralist, and apparently made every preparation to sell his own life dearly, for he said it reminded him of the old days when members had to form a hollow square in front of the Speaker's chair in order to secure freedom of speech. Inspired by these memories, and having the whole House at his back, he determined to slay Brown incontinently, and moved his expulsion, and was with difficulty appeased by having the wretched man censured by the Speaker. The absurdity of the affair was increased by the fact that Mr. Dawes, and every other old member of the House, remembered many encounters between Republicans since the war fully as discreditable, and some of the wicked Democrats insisted on having the reports of some of them read. In not one of them, however, was the vituperation nearly as justifiable as in Brown's case. He said little more of Butler than what every honorable man in the House and in the country thinks. The Chairman of the Republican National Committee has, indeed, pronounced the old "statesman" compendiously "a liar and a blackguard," but we think Butler ought to be, though of course he will not be, followed into his retirement by some formal expression of the reprobation which the great body of his colleagues undoubtedly feel. The party which has used him for so many years owes something of this kind to the morality of the country, which it has allowed him to outrage, and to the youth of the country, whom his political success has helped to debauch. Let us say to Mr. Dawes, that one-tenth part of the wrath excited in him by Brown's blatherskite, and one-fiftieth part of the courageous virtue which he displayed in calling for Brown's punishment, would, if displayed on several really serious occasions, have done him some credit, and the cause of honest government much service; but when these occasions came there was no more fight in him than in a sucking dove.

A plan of compromise has been got up in Louisiana by the Congressional Committee in the form of a contract, treaty, or protocol between foreign states. On the one side the memorandum pledges

the Conservative claimants of seats in the Louisiana House and Senate to submit their claims to George F. Hoar, William A. Wheeler, William P. Frye, and Samuel S. Marshall, and to abide by their award; binds any Conservative claimant to whom George F. Hoar, William A. Wheeler, William P. Frye, and Samuel S. Marshall may give a seat, as well as all other members and senators who sign the document, vulgarly speaking, to "put the thing through" by the adoption of a joint resolution pledging every one, first, to recognize and support Kellogg; second, to abide by the award of George F. Hoar, William A. Wheeler, William P. Frye, and Samuel S. Marshall as to the distribution of seats. This compromise would give the Conservatives a majority of about ten in the House, and that party held a caucus, and at first voted to adopt the plan. Against this action Wiltz and McEnery protested, and it was rescinded, and a mass-meeting was afterwards held denouncing the compromise, and a resolution was passed reminding the Conservative senators and representatives that they were elected by the people to represent them in the Louisiana Legislature, and that no authority whatever has been given them to make any contract of the sort proposed which could be binding on the people.

In this they are undoubtedly quite right; but their error seems to arise from the mistaken notion that it is popular government which the State of Louisiana enjoys. The people have nothing to do with the government in Louisiana. They may hold mass-meetings and pass resolutions, but the government is just now in the hands of Messrs. George F. Hoar, William A. Wheeler, William P. Frye, Samuel S. Marshall, and William Pitt Kellogg. A little while ago it was in the hands of Messrs. Foster, Phelps, and Potter, but they declined to do anything with it except make a report, and General De Trobriand kept it for a few days. Before that it was, according to General Grant, in the possession of Congress, and, according to the Attorney-General, in the possession of Grant, but the people of Louisiana have nothing to do with it. Besides their protocol, Mr. Hoar's committee have examined a good many witnesses, some of whom show a disposition to testify to the wrong kind of intimidation (*i.e.*, intimidation of Democrats by Republicans), which we endeavored to explain last week. There is one thing about the evidence taken in Louisiana which is encouraging: that there is at least plenty of it. It may be worth little or nothing, but will, according to estimates carefully made, in bulk go far beyond any testimony ever taken by a Congressional Committee of Enquiry. Besides this, when the Committee come back and report, as Messrs. Phelps, Foster, and Potter did, there is nothing to prevent Congress going down in committee of the whole, to get a little additional light, and then, when Congress comes back, we might all go down in a body, and stay there till we found out the real facts about this perplexing business, so as to remove all doubts and finally settle the thing.

The Committee of the House appointed to enquire whether the government of the State of Arkansas was republican, monarchical, or aristocratic in form, has made its report, and finds that the new constitution is republican and in many ways better than the old one, and was adopted by, and is satisfactory to, a majority of the voters of the State; that the condition of the State has been as peaceful since the adoption of the new constitution as it ever was; and that "the mass of people on both sides are inclined to peace and good government," though there are among them turbulent young men who do, now and then, "invade the rights of colored men"; but that, on the whole, the state of things in Arkansas is very much like that of the other Cotton States the control of which has passed into the hands of the class which ruled before the war; that the committee cannot find any solid ground on which to recommend the interference of the General Government; that the principle is now well established that, whatever defects of form there may be in the manner of submitting a constitution to the people, they are cured by the popular ratification, and that "the people of every State have the right to make their own constitution to suit themselves, provided it be republican in form and in harmony with the Constitution of the United States." The majority of the committee—Messrs. Poland, Scudder, Sayler, and Sloss—therefore decline to make any recommendation with regard to Arkansas; and Mr. Ward, of Illinois, makes a minority report, in the form of a resolution, in which he finds that Brooks, who was elected to the office of governor in 1872, is entitled to retain it until 1877, no matter what the majority may say, and was ousted by force, and is still the lawful governor of the State.

The President, however, was by no means troubled by this deliverance, and evidently believes that he knows more about the Arkansas matter by mere insight than any committee. Accordingly, on Monday, the day after the committee had presented their report, he sent a message to Congress which seems to have startled even the best friends of the Administration. In it "he ventures to express the opinion" that Brooks was lawfully elected governor in 1872; that the constitution under which he was elected was overthrown by "violence, intimidation, and revolutionary proceedings"; that "if these proceedings are permitted to stand," minorities are left without protection in all the States, and that the other Southern States may also "change their constitutions and violate their pledges"; that the precedent is dangerous to the stability of the State government, if not of the National Government; and he begs Congress "to take definite action in the matter." This extraordinary document, on which we have commented elsewhere, appears to have been prepared without consultation with the Cabinet, and bears every mark of the instigation of Clayton, McClure, Brooks, and the other members of the Arkansas carpet-bag lobby. It has taken Congress by surprise; but it is all but certain that no definite action "will be taken," and that if the Executive wishes to overturn the existing State government he will have to do it himself, in which case it will be the solemn duty of the next Congress "to take definite action" in his own case when it meets in December. In fact, unless something is done to clear his mind with regard to his relations to the State governments, it would be but decent to give him the title of "Lord Protector" at once. The functions with which he now apparently considers himself charged are not those of the officer known as President of the United States.

The *Tribune* has published during the past week several documents of interest in relation to the Emma Mine and those connected with it. The first of these is the complaint in the case of the English stockholders against Park, Stewart, and Baxter, and the other is General Schenck's little book on poker. The General has written a letter to a complaining friend explaining the facts. He says that the story that he wrote and published a treatise on the game is an infamous fabrication. The real fact was that he was staying at a pleasant English country house, where the family amused themselves by playing cards, and, following the British custom, they played for pennies and sixpences—the limit of bets is not stated. Here it suddenly came out in the course of a light and agreeable conversation that the General understood the American game of poker, and he was requested to explain its mysteries to the company. This he very obligingly did, and at the request of the lady of the house finally reduced to writing the rules of the game. Somebody else went off and printed it on a "private printing-press"; and this is the foundation for the whole story. The main charge about General Schenck, however, in connection with poker is not, as has been said, that he is a professional gambler but that the honor and dignity of this country abroad are not well represented by a politician who is best known socially as a master of a low and demoralizing form of amusement, which principally requires for success, not skill, patience, and a good memory, but, as General Schenck elegantly expresses it in his little treatise, "plenty of cheek."

The complaint of the English stockholders lays great stress on the connection between the swindle and the reports of

Professor Silliman, making the same charge against him that was made by Mr. Paffard in the pamphlet a résumé of which we published some time ago, the chief charge being that he allowed himself to be improperly influenced, and in a measure connived at the swindle, with the understanding that he should receive five thousand dollars in any case, and forty-five thousand more if his report should be of the right sort. Mr. Silliman has written to the *Tribune* flatly denying all these charges, and expressing the hope that the action may be pushed to a trial, and his character thus be vindicated, at as early a date as possible. The Boston *Advertiser*, in copying this letter, intimates that Mr. Silliman is unfortunate as to charges. These same matters have been made the occasion of an accusation against him in the National Academy of Sciences, and also in the American Academy, and, though no definite action has been taken, Professor Silliman "has suffered much in his scientific reputation in consequence of these and similar reports to his prejudice." His friends, as well as those of Park, Baxter, Stewart, and Schenck, must be gratified that they all have an opportunity at last of satisfactorily explaining their connection with the mine.

The defeat of Mr. Carpenter in Wisconsin, to which his position in the Senate gives national importance, was due to one of those combinations between Democrats and right-minded Republicans by which so many other Republican defeats have been wrought during the past year. Eighteen of the Republican members of the State Legislature refused to go into the caucus which nominated him, and steadily refused to vote for him at the election, on grounds which they set out in a printed circular—viz., that they were either formally pledged at their election to oppose him or it was understood that they would do so. Inasmuch as the platform of the party at the late State election denounced among other things the Crédit Mobilier and the Salary Grab, both of which Carpenter had defended, they held that these resolutions operated as a dismissal of him from office, and acted accordingly. Moreover, they found on coming to Milwaukee that the majority of the committee appointed to call caucuses were composed of Mr. Carpenter's friends, who put off summoning the caucus until there had been time to summon a "tremendous lobby, composed in large part of minor Federal appointees, as well as several distinguished citizens in high official position." The result was the election of Mr. Cameron, a man of high character and at least fair abilities, and a Republican whom the Democrats declared their willingness to accept on a hard-money platform. What is most remarkable in the course of the anti-Carpenter Republicans is that it is a formal acknowledgment, and the first we have had for a good while, that the party is really bound in its action by the declaration of principles and policy contained in its platform. For some years back the Republicans have treated their platform as a literary essay which imposed no obligation on anybody, and have every year nominated and supported candidates for office who were the vehement opponents of its leading doctrines.

Carpenter's defeat is in some ways to be regretted. He was able, and on some questions now pending—Louisiana, for instance—was more clear-headed than most of his colleagues. But he was none the less a dangerous person, and was a prominent member of the class whom it behooves us, at all cost, just now to get out of public life—the glib, dextrous, unscrupulous, impudent, shameless, greedy, coarse class, which has become large and powerful since the war, to which politics furnishes simply a means of making some money and securing excitement, and which, by its influence over the weak, goody class, is every year dragging the Government into deeper degradation. Carpenter was a genuine Butlerite—not the worst of his kind, but still bad. He enjoyed life on its sensual side, cared nothing about character, liked money and was not particular as to how he got it, as his relations with Kellogg showed, and was, in fact, a kind of person whose presence in the Senate is a disgrace as well as a danger. To be rid of him and Mr. Chandler would be a great gain, even if they were not replaced by men as respectable as Messrs. Christiancy and Cameron. These two defeats are calling the attention of the party still more forcibly than ever to the increasing gloominess of its prospects. The Democrats will have a clear majority of 70 in the next House, and the comfort which it was at first thought could be extracted from the composition of the Senate begins to fade. Of the 25 Senators whose terms expire in March, 17 are friends of the Administration, and 19 of their successors will almost certainly belong to the Opposition; so that the Administration will in the next Senate probably have only 41 votes against 33, and in these times, when the hearts of good Republicans are failing them for fear, a majority of eight is a very slender reliance.

English politicians have been occupied with the selection of a successor in the House of Commons for Mr. Gladstone, and the choice has fallen on the Marquis of Hartington, whose qualifications for the place our London correspondent sketched some weeks ago. The *Economist* made to him in advance the very weighty objection that as Lord Granville was to be the leader in the upper house, it was very undesirable to take the leader of the lower house from the highest and most aristocratic class also. The Commons, in fact, nowadays need to be led by some one who is in complete sympathy with the bulk of its members, which a man of the Marquis of Hartington's position can hardly be said to be. Mr. Forster is thrown out by his having offended so many Liberals by his Education Bill, but the rejection of him on this score is regretted by the most far-seeing men of the party. Mr. Gladstone, beyond doubt, will give himself up largely to literature and theology, and will probably figure prominently for a few years as a writer of pamphlets and reviews. He has addressed to the American public, through Dr. Schaff, the request he has already made to the British public, that people who write him letters in a state of excitement about the Pope will excuse him for not answering them.

The only other topic to which the English press has been devoting itself with any zeal is the case of Rubery *v.* Grant, which has ended in a verdict of £500 for the plaintiff. The *Times* poured forth a burst of indignation over it against Sampson, its guilty city editor; and said that if it had had the smallest conception of his relations with Grant, it would have got rid of him long ago. Sampson then published a letter, saying he was going of his own accord long before this happened, to which the *Times* replied through its solicitor, saying that his dismissal had been resolved on before this affair occurred, as certain correspondence would show. The papers have all discussed the affair from various points of view, but none of them throw much light on it except the *Economist*, which, of course, considering the power that Sampson has had for many years over all new financial schemes, approaches it with much interest, and offers the English morning papers some advice apropos of it which we cannot help condensing for the benefit of our daily contemporaries, none of whom seem to have seen it. We beg also to call the attention of the religious, and especially the deeply religious, press to it:

"(1) To make the situations of those who supply such important intelligence (the money article) so good that they ought to wish to keep them, and are not tempted by poverty to take bribes or to misuse their influence.

"(2) Not only to appoint the best and most trustworthy persons to these situations, but to watch with an incessant attention what is the nature of the intelligence which they bring, and what of that which they do not bring. The last is as necessary to consider as the first. If an influential writer has before him A, B, and C, and if he exposes A and B, but leaves C uncommented on, or puts it among fair speculations without remark, he gives C the command of the market as far as he can.

"Thirdly, the public should learn to follow with less confidence than they sometimes do some of these unknown guides. They should attentively enquire before they invest their money in reliance on assertions, what sort of person it is who makes them, what is his ability to judge, and what his *bona fides*. If they do not do so, they will probably be ruined."

This last rule applies with peculiar force to "Publishers' Departments."

## THE CASE OF ARKANSAS.

As might naturally have been expected, the Arkansas carpet-baggers were encouraged by the success of their brethren in Louisiana in the expectation that the Government might, before the present Congress adjourned, be induced to interfere by force to restore them to the power from which the people of that State had driven them. A powerful lobby of these adventurers, led by Dorsey, Clayton, and Brooks and McClure, have been working might and main ever since last fall to induce Congress or the President to set aside the constitution then adopted and overturn the existing State government elected under it. A committee of the House was appointed under their solicitation to rouse "the sleeping giant," by enquiring whether Arkansas had a "republican form of government," but really to find out whether the constitution submitted by the Baxter legislature to the people, and adopted by an overwhelming majority, had been lawfully submitted and lawfully adopted, and whether it would not be well to upset the existing State organization, and let the carpet-baggers build it up again under the protection of the Department of Justice and the army and navy. The committee has made an excellent report, of which we give a summary elsewhere, finding that though Brooks was rightfully elected, yet that the present constitution had been lawfully adopted, and that the State was peaceful, but making no recommendation. The President has, however, entirely disregarded this report, which has been made after long and careful enquiry, and has sent in a message of the most extraordinary character, denouncing the adoption of the present State constitution as a "revolutionary proceeding," and recommending Congress to interfere forcibly. What makes this performance all the more surprising, not to say alarming, is that the Cabinet had no notice of it, and that even the faithful Williams does not seem to have been apprised of it. One does not need to accept the ill-natured suggestion of the correspondent of the *Tribune*, that the President consulted nobody about the matter except "Boss" Shepherd and General Babcock, in order to see in this last message a striking confirmation of the prediction on which we ventured four weeks ago, that his growing infirmities of temper "would cause a good deal of trouble and anxiety before his term of office expired." By infirmities of temper we meant that intractability, or combativeness, or "ugliness," as one pleases to call it, which, combined with freedom from the traditions of civil life, led him to renominate Shepherd for the governorship of the District the minute Congress had legislated him out of the same office for corruption, and led him to invite Harrington to a party at the White House while this person was on trial for a criminal charge arising out of the operations of the District Ring. He was not very sensitive to public opinion when he took office—successful military men, even when their training is better than his, hardly ever are; and the criticism of one sort or another to which he has been subjected seems to have aroused in him a spirit of sullen defiance of it which we fear promises troublous times when the majority in Congress is no longer friendly to him. If this last message had been intended to show civilians that he did not care two straws for their opinions, it could not have been more effectively drawn, and, indeed, it has a ring of indifference to the usages of civil government, and to the considerations and processes on which political action in constitutional countries is always based, which one can hardly hear without vague alarm.

His course is rendered all the more remarkable by the fact that this Arkansas affair, and especially the validity of Brooks's election, has been already before the General Government, and was passed upon by the President and his Attorney-General with unusual deliberation last year. Baxter, Brooks's opponent, was, be it remembered, counted into office by the State legislature, and Baxter took and held the office for over a year without disturbance. Brooks then suddenly invaded the State-house at the head of an armed force and ejected Baxter, and there followed a state of "war," and an appeal to Washington, pending which the peace was kept by United States troops. The Attorney-General then decided that under the State constitution the legislature had the sole authority to determine contested elections to the governorship, and that, as it had decided at the canvass in favor of Baxter, Baxter was the lawful Governor, and Baxter was accordingly seated in his place by Federal force. Soon after, this same legislature passed an act providing for a Constitutional Convention. The convention was peaceably elected, met, and drew up a constitution, which was submitted to the people, and adopted by an overwhelming majority. The validity of this constitution has been examined and confirmed by a Congressional committee; Judge Jameson has given an opinion that it is as good as any constitution in the country; and there is no pretence that the State is not peaceful and prosperous under it. Nevertheless, in defiance of all this, the President now comes forward and recommends Congress to disregard his own deliberate decision of last May, the opinion of its own committee just rendered, and that of the best lawyers in the country, and authorize him to overthrow the State government and put into the hands of army officers the duty of canvassing the votes, confided to the State legislature by the constitution of 1868, the validity of which nobody has disputed. It would be impossible to comment on all this adequately without using stronger language than it seems as yet desirable to use, and we shall consequently content ourselves with submitting the facts to the calm judgment of our readers.

We have no doubt that the great majority of the American people, without more than a general knowledge of the case, think that the best thing for the President to do about Arkansas is what he is doing about New York; think, in short, he ought to concern himself exactly as much about the legality of Governor Garland's election and the validity of the constitution of Arkansas as he concerns himself about the legality of Governor Tilden's election and the validity of the recent amendments to the constitution of this State. This is plainly the course which his oath of office makes imperative and that public opinion calls for. But we will ask our readers to forgive us for boring them once more with a subject which in another month we hope to quit for ever, while we submit some fresh facts, showing that not only is it the legal duty of the Administration to stop meddling in Arkansas, as in other Southern States, but that expediency and justice of the highest order require it to do so.

Arkansas has not suffered as much from the carpet-bag régime as Louisiana, because it had not, as Louisiana had, a wealthy, complex, commercial society; but it went through the same curious process of spoliation as the other Cotton States—a process which, like the Ring frauds in this city, future historians will find interesting as illustrative of the way in which the machinery and public credit in a modern state can be used by knaves of the lowest class for their own benefit. In 1868, the carpet-baggers everywhere came into power in those States of the South where there was a large negro vote under new constitutions, got up under the superintendence of Congress, and with the aid of the proscription of the persons who had lent aid to the rebellion. In Arkansas, they found a bonded debt of $3,252,401, no floating debt, and a balance of $319,237 in the treasury. In the following six years—that is, before October, 1874, when they were ousted—they had increased the bonded debt, under one pretext or another, by $8,753,444, and had created a floating debt of $1,864,721. Some of the bonds were issued for "public improvements," such as raising levees to protect the rich bottom-lands from the overflow; but there was absolutely nothing done for the money, except the erection of a few buildings, which are valued at about $100,000. In fact, to speak plainly, they imitated the Georgia peculators, and divided the money among themselves.

The exhibit as regarded the State expenses is equally pitiful. The expenses of the State government should not, it is estimated, in a simple agricultural community like Arkansas, exceed $300,000 a year all told. The carpet-baggers, however, actually levied in taxation about $1,100,000 per annum during their six years' reign, or $6,674,511 in all; of this, $515,204 went, during the whole period, to pay interest and keep up the sinking fund, and the rest, or

about $1,026,551 per annum, went for the ordinary expenses of the government. Add to the amount received in taxation during the six years the amount of the floating debt created, and we have a total of $8,539,232 spent by these wretched adventurers in keeping up a kind of caricature of government, with the United States at their back, when a good government ought not to have cost over $1,800,000 for the whole period. In fact, their six years' rule has cost this young State, just emerging from backwoods barbarism, over $17,000,000, and they have actually had the audacity to go to Washington, after having made away with the money, and ask the Government to use the army and navy to put them once more in possession of the treasury they have plundered.

The new State government, which has been elected by the people and is composed of honest men, is now trying to infuse order into the finances. It has not only found the treasury empty, the State credit gone and its bonds unsalable, but has found the revenues anticipated for three years at least by outstanding auditor's warrants and treasurer's certificates, which had been made receivable for all public dues except interest on the public debt.

In order to fund this floating debt, and so obtain control once more of the State revenues, the present government proposes to issue bonds, for which these warrants and certificates shall be receivable, fixing a rate at which they may be sold for cash, the money to be used in taking up the warrants and certificates, and, as part of the contract, pledging the State to levy a special tax every year sufficient to pay the interest on the bonds and create a sinking-fund for their final redemption. The Governor is also authorized to have the lands of the State, except the school lands, sold for the same purpose. We believe that under the new constitution the State has been rapidly reviving. It has been brought into railroad connection with a great market at St. Louis within the last year; and as its natural resources are vast, and the great bulk of the population really sober, honest, and peaceable people, emigration is beginning to find its way in very rapidly, and it is safe to predict for it, as soon as Congress adjourns and all fear of the army and navy is removed, a career of great prosperity. With the growth of industry and of material wealth and the spread of education—for it has now its schools—the manners will undoubtedly improve, and the habits of turbulence bequeathed by slavery and frontier life gradually disappear. The great forces of civilization are nowhere dead among the race which has reclaimed this continent and is now founding a great empire in another wilderness in the Southern seas. It may sometimes seem as if a passing wave of barbarism, like slavery, would overwhelm them; but we shall only have to wait a few years to find them working once more with remorseless and untiring energy, building up prosperity on character and covering liberty with law. The unfortunate condition of the Southern States will seem, a few years hence, but a trifling episode in the history of that majestic progress. The scalawag and carpet-bagger will have followed the slaveholder into the limbo of half-forgotten curiosities, and people will smile over the hallucination by which many of us in this generation are possessed, that it is possible for a few smart attorneys to provide by bill and resolution a governmental substitute for the austere courage which turned the tide of battle at Naseby, and the splendid political sense which has created the American Republic. It will be said of the Republican party, too, which is now passing from the stage of events, that, while it had the rude and fanatical energy which was needed to suppress the rebellion and extinguish slavery, it had neither the wisdom nor the skill nor the foresight to assist the unfortunate communities which the struggle had devastated to build up a new and better civilization on the ruins of the old one, but that it hindered and vexed them in their very first efforts to rise, by maxims and expedients borrowed from the arsenals of ruined monarchies and the dreams of sentimental philanthropists. That the chapter which tells the story of reconstruction should have to follow in American history the chapter which tells the story of the war and of emancipation, is something over which many a generation will blush.

## AN INSTRUCTIVE RETROSPECT.

ANYBODY who will take the trouble to turn to the files of the daily press for the year 1867, and will read in them the reports of the impeachment of Andrew Johnson and the editorial comments on it, will find in them much matter for serious though by no means melancholy reflection. In fact, most of it will, we regret to say, furnish food for exceeding merriment. According to most of the leaders of opinion in the Republican party at that period, the trial of Johnson for high crimes and misdemeanors was the most tremendous legal process ever undertaken by a civilized people since the condemnation of Socrates, and for two reasons. The first was that Johnson's crimes and misdemeanors actually beggared description. They made the nomenclature of criminal jurisprudence seem feeble and trivial. Many of the orators and newspapers tried to give some faint idea of them by calling him "the greatest criminal of this or any other age," which was tantamount to saying that, in order to form a fair estimate of the depths of his guilt, you would have to ransack the history of crime since the first recorded Olympiad, even if you took no count of the iniquities of the antediluvian population. No ancient or modern tyrant or conspirator could, to speak familiarly, hold a candle to him when he was at his worst, and doing the things he most loved. The second reason was, of course, that his retention of the Presidency endangered the existence of the Republic. It was declared boldly that he would probably, if let alone, use the army and navy to overthrow the Government and establish himself as some kind of despot, and repudiate the public debt. It was useless to point out that as Congress was very hostile to him, and as the country stood by Congress, he would probably be worsted at a very early period of an armed struggle—not being himself much of a strategist, and having no resources beyond his farm in Tennessee. The great minds of the party would not hear of his being let alone. Thaddeus Stevens said that his "corrupting of the voters of the nation by seducing them with offers of office and intimidating them by threats of expulsion, was more heinous than that which brought many ancients to the block." As this—viz., the use of the patronage of the Government to reward his own supporters—was the very least of his offences, the gravity of the weightier ones may be imagined.

They accordingly got up a tremendous trial of this Tennesseean Catiline. They had "articles" and "managers of impeachment," and a "high court of impeachment," and an "Apostle John of Salvation by impeachment" in the person of Butler, and a "cold and classical Demosthenes" and a "black-haired Energy," and "a steady Wind blowing aft," in the person of Mr. Boutwell, among the managers; and Butler opened the case in a speech which, one impeachment paper said, "sounded like the screeching of a hundred saws commingled with the rumbling of an artillery carriage across rough pavement," and when he got to some portions of the President's career even his resources failed him, and he threw round the criminal "the mercy of his silence." Boutwell, "the black-haired Energy" of the case, was so overcome by the spectacle of Johnson's crimes that he uttered the wish that the unhappy culprit could be projected into that portion of space in which the astronomers discover a remarkable lack of stars, and which the orator called "the hole in the sky"—this being, in his opinion, the only portion of the universe in which such a wretch could be properly and safely accommodated. Other papers called on the pious people all over the country to offer up prayers to Almighty God for the conviction of the monster and to "burden the mails" with letters to senators begging them to find him guilty, no matter what the law or the evidence might be; and our readers will all remember the coarse and brutal bullying of the minority of the Senate which was practised by a portion of the press and of the politicians, under the lead of the "Apostle John," in order to press them to vote "yes" on some article or other.

Turning to the charges contained in the articles, they have at the short distance of even seven years a very comic air. The Great Criminal had dismissed an officer of his Cabinet who opposed his "policy," and tried to put another man in his place. He had told

the commanding general in Washington that the law directing orders for a change in the disposition of troops to be sent through the general of the army was unconstitutional, and he had made several foolish and violent and abusive speeches about Congress "in a loud voice." These were the whole of his high crimes and misdemeanors. He was not convicted, and he went out of office peacefully, and went back to his village in Tennessee. Ben Wade did not take the Presidential chair in his stead, to be used as the tool of a band of unscrupulous and reckless politicians, and Butler's powers of mischief were not increased, and his great coadjutor, Mr. Boutwell, had to turn to the novel subject of finance to quench the flames of his zeal. In fact, the whole affair passed off like a noisy supper-party, leaving a large number of philosophers and patriots with aching but wiser heads; and now, after seven years' retirement, Johnson comes back to the Senate amidst the good-humored laughter of the people whose ruin he was accused of compassing. There has rarely been a more amusing episode in the history of any people, nor a better illustration of the way in which an incident of really trifling importance can be worked up by the efforts of unscrupulous politicians, supported by unscrupulous newspapers, so as to wear the look of irretrievable disaster.

When Johnson himself now takes up the old articles and reads them his grim features must, in spite of his want of humor, often be lighted up by the broadest of broad grins, and, unless he has in his seven years' retirement lost some of his old fire, he will, when Congress next meets, treat the Senate to a speech in substance somewhat as follows: "I felt when I was under accusation that my enemies were making themselves ridiculous, and that I had done nothing wrong, and that though I was perhaps not one of the greatest or most decorous men who ever sat in the Presidential chair, nevertheless not only was I not the monster that I was painted, but worse men might come after me, and without being prosecuted or denounced. It is true I advocated a plan of reconstruction of which the party did not approve, but it was one which Lincoln devised, and which he, had he lived, would have carried out, and which it is now plain an honest and patriotic man might very well have supported. You have carried out your own plan, and you are actually boasting of its failure, and trying to prove to us every day that it has resulted in leaving the South in the worst possible condition. You confess that it has deprived the negroes of all protection for life or property and has impoverished the whites; and you must admit that a worse result than this mine could not have had. You said I was corrupt; but while I was in office I never accepted a gift, and I never put a relative in any place of trust or profit, or used the public service to promote my private interests or those of my family. I pardoned, doubtless, some very bad criminals, but no criminals of my pardoning ever found their way immediately afterwards into Government offices. I never offered to a prisoner under trial the hospitality of the national mansion in which I lived; nor had I ever the audacity, much as I despised Congress, to nominate for high civil functions a man whom it had just legislated out of office for gross corruption. My views on the national finances may not have been sound in all respects. I had not the advantage of all the discussion which the subject has since undergone, but I put the Treasury in charge of an experienced financier—not of an ordinary politician—who advocated and carried out as long as he was allowed the very policy for which the wisest of you are now striving. The Treasury was never made in my day the headquarters of a ring of informers and peculators, and, though you thought I was regardless of law, I never permitted such a tremendous assumption of power as issue of paper-money for political purposes, by a single man and in defiance of the opinion of a committee of the Senate. Nor did I ever take the funds belonging to the foreign service of the Government from the hands of a great banking-house, and give them to a Wall-Street adventurer with small capital and less credit. It is true I told Emory that the law directing orders to pass through the general of the army was unconstitutional, but I never shelved the general of the army completely and sent orders without any regard to him, nor did any army officer, with my permission, ever interfere with the organization of a State legislature or issue vituperative proclamations directed against whole classes of citizens. Moreover, although I was not successful in bringing our differences with England to a happy termination, I honestly strove for that end as well as I knew how. I selected for the English mission one of the most distinguished lawyers in the country, who had half-a-century of honored private character behind him, and who, though he doubtless was over-gushing in his relations with our enemies, came back without leaving a stain on his name or on that of his country. No speculator or adventurer ever dared to approach him with any scheme for the spoliation of unsuspecting foreigners, and, so far as he was known in the society of the capital to which he was accredited, he was known for learning and ability and for an illustrious professional career; and if he did not conclude a treaty, neither did his successor. I made, it is true, some foolish and vituperative speeches; but you had in Congress plenty of men as foul-mouthed as I, whom you honored or laughed at; and if you expected me to become polished and self-restrained, choice in my language and in my company, you were more exacting toward me than you have been since towards others. My tongue may have been loose, and my temper bad; but I can at least say for myself that the affairs of state were the subjects of which I most loved to talk and think; that for forty years they had been my main interest; and that my own comfort or gratification or enrichment was never allowed to prevent any absorption in them; and that my friendships, such as they were, grew neither out of toys nor lust nor wine, but out of sympathy and agreement about public concerns."

## ENGLAND.—WORKING-CLASS CANDIDATES.

London, January 16, 1875.

IT is curious to notice from time to time how strongly English institutions are influenced by fictions and traditions which have no substance in them, but which nothing short of a revolution would induce English people to change. You find them in all the paths and even the byways of English life, and in every profession and nearly every trade. But, not to dwell upon a subject which might be spun out almost indefinitely, let me take one of the most common and least understood of these fictions, viz., the Stewardship of the Chiltern Hundreds, and explain what it means. If, I suppose, a member of any representative body in any civilized country of the world wishes to cease being a member, and to retire into private life, he sends in his resignation, and there is an end of it. But a member of the British House of Commons cannot resign his seat. He may become disqualified from sitting in that assembly by accepting some place of honor or profit under the crown, or by some other cause, but Parliamentary law does not permit him to resign. If, therefore, a member desires to retire from the House, he must set about and find an office which he can ask, even from his political opponents, without much risk of refusal, and, having got his office, he is disqualified as a member of Parliament from sitting in the House of Commons, and then, by resigning his office, he is at liberty to retire from public life. It seems a roundabout way of doing a simple thing, but it is the only way of doing it. The Stewardship of the Chiltern Hundreds is the office generally applied for in the circumstances. The Chiltern Hills are in the centre of Buckinghamshire—Mr. Disraeli's county—and Buckinghamshire is perhaps the most benighted county in England. The country people there know all about Hampden, and something about Oliver Cromwell, but about more modern English celebrities they are profoundly ignorant. If you speak to a Buckinghamshire peasant, for instance, about "the Prince," meaning "the Prince of Wales," he gapes at you, and, if he answers at all, will show that his mind, or what for courtesy we will call his mind, is running on Prince Rupert. "Parliament," if it suggests any sort of idea to such a peasant, suggests old traditions which he has heard from his progenitors of the Long Parliament and the Protector. But, however backward the Buckinghamshire rustics may be in the appreciation of modern history, they have their Chiltern Hills, covered still with beautiful beech forests, and in the old days these forests were infested by robbers. To restrain the robbers and to protect the peaceable inhabitants of the neighborhood from their inroads, it was usual for the crown to appoint an officer, who was called the Steward of the Chiltern Hundreds. Though the beech forests remain, the robbers have withdrawn from them to the more perfect seclusion of the slums of East London, and the office is now an ob-

solete sinecure, and but for the secondary object of enabling a member of Parliament to adopt a roundabout way of resigning his seat, it might be abolished to-morrow. But we cling to our fictions, and for the last century and a quarter, whenever a member of the House applies for the Chiltern Hundreds, it is granted (generally, though not invariably), on the understanding that the member instantly resigns it, and, his seat being vacated by his acceptance of office, a new writ is issued for the constituency which he had represented.

This roundabout process has just been gone through by Mr. Melly, the member for Stoke-upon-Trent, a borough among the potteries in Staffordshire, chiefly remarkable for having been at one time represented by Josiah Wedgwood, a descendant of the creator of the celebrated Wedgwood ware. Mr. Melly was a fussy, voluble politician, who will be no great loss to the House of Commons, but the contest for the seat which he has vacated promises to be a not unimportant one in English politics, inasmuch as by it the future attitude of the Liberal party towards what are called "workingmen's candidates" may be decided. Stoke contains a population of about 131,000, and the registered electors number 18,607. It has always been regarded as a Liberal borough, and, with one or two trifling infidelities, it has been generally faithful to that party. So confident were the local Liberals in their strength that they suffered three candidates—two moderate Liberals and a "workingman's candidate"—to stand for the two seats at the late election. The Tories, who are always alive to the chance of stealing a seat, and who have got a party organization infinitely superior to that of their opponents, brought forward one candidate, and secured one seat; the Liberals with their three candidates gaining the other. For the contest that is now impending the "workingman's candidate" has again come forward, and, up to the present time, no other Liberal has been entered. If things therefore remain as they are, there will be a fair fight with no favor between a strong local Tory and a workingman—the latter having been for thirty years a journeyman mason, and having been one of the working masons employed in building the Houses of Parliament. The House of Commons has never been closed against representatives of the working-classes. Before the old Reform Act (not to mention other cases), Orator Hunt of Preston notoriety represented that borough, and contributed more than one criticism, more candid than complimentary, to the Bill of 1831. At the general election which succeeded the passing of the act in 1832, William Cobbett, originally an unlettered private soldier in the army, and of the humblest origin, was elected to represent the borough of Oldham, and during the short time that he was in the House—for he died in 1835—he had earned for himself no small political distinction. From time to time since his death an occasional labor candidate has succeeded in finding his way into what is not unjustly considered "the pleasantest club in the world." But until the passing of Mr. Disraeli's Reform Act in 1867, by which the franchise was lowered to household suffrage, the attempts made by labor-candidates have been fitful and only rarely successful. There was little or no desire on the part of the working-classes to be represented; they had no organization for election purposes; and the race of paid and unpaid agitators for the representation of labor was not in existence. We have changed all that. There is now a "Labor Representation League" with a paid secretary and a squad of paid orators, and a local organization by means of trades-unions in nearly every important borough in the country. The "workingman's candidate" is fast becoming a formidable animal, and the hearts of the wire-pullers of the old Liberal party are failing them for fear when they see the ravages made in the most trusty constituencies by this new candidate for the suffrages of the householders. At the general election, no fewer than nineteen workingmen were put forward in England alone, and, although only two succeeded in securing seats, the success of the Liberal candidate in each constituency where they were put forward was imperilled, and in about half the constituencies thus embarrassed the Tory party gained seats, where, but for the workingman's candidate, they would have had but little chance. The most remarkable instance of Tory success achieved in this way was at Nottingham, where no less than four Liberal candidates stood, and two Tories were returned. Since the general election, the borough of Northampton, which of old was among the staunchest of Liberal constituencies, has been lost to that party and gained by their opponents through the candidature of a Mr. Bradlaugh, who calls himself the workingman's friend; and now there seems every probability that the borough of Stoke-upon-Trent, which has been as the apple of the Liberal whip's eye among boroughs, will be wrested from the Liberal party. Like the patriarch of old, the excellent whip of the party is going about wringing his hands and saying: "Nottingham is not, and Northampton is not, and they are going to take away Stoke-upon-Trent also."

To any one who watches the different phases of English political life, this attitude of the "workingman's candidate" presents some interesting considerations. Mr. Rathbone Greg, in his recent book of sinister augury called 'Rocks Ahead, or the Warnings of Cassandra,' dwells with emphasis on the fact that political power in this country has been taken, by Mr. Disraeli's Reform Act, from the propertied classes and handed over to the proletariat. The wage-earning class in the kingdom who are enfranchised by that act number about five million, against two million which represents the propertied or wage-paying class. Thus it is manifest that, if the proletariat care to do so and will work together, they have the power to return to the House of Commons, not a majority only of our legislators, but almost the entire body. Up to the present time they either do not know their power, or do not care to use it. But they are learning all about it rapidly. Six months ago they thrust their candidate into the field at Northampton, and now they have thrust the other Liberal candidate out of the field at Stoke. At first, this policy can have but one result. It "dishes" (to borrow the late Lord Derby's now hackneyed expression) the moderate and middle-class Liberals, and brings about the return of the Tory candidate. The middle-class electors will not vote for a workingman or a trades-union candidate, many of them being themselves master-tradesmen or small employers, in a state of chronic warfare with the operatives. They will either support the Tory or abstain from voting. In some constituencies the Tory wire-pullers, looking only to the present election and seeing the chance of snatching a victory, are short-sighted enough to favor the overtures of the labor candidate, and even to initiate them, with the view of dividing the Liberal interest. But this is a suicidal policy for the Tory party to adopt. They are the propertied classes in the country, and the more they encourage the proletariat to come to the front, the faster will that class of the community appreciate the full strength of its power. And who will chiefly feel the exercise of that power? Not the middle-class shopkeepers and master-tradesmen and small employers who make up an important section of the Liberal party. It is not material to them, as their earnings and modest fortunes will not excite the cupidity of socialistic agitators. But the great landowners, the old aristocracy, and the wealthy mercantile classes who make up the heart of the Tory party—they are the people who will suffer, and who will have to thank their own too clever wire-pullers for their sufferings. In a small country like England, with a circumscribed territory and an enormous population containing the richest and the poorest human beings in the world, all closely packed in a small island and almost rubbing shoulders with each other, attacks, direct or indirect, on property are sooner or later almost inevitable. It shows a lack of wisdom on the part of the propertied classes to help to hurry on so grave a contingency for the temporary gratification of winning a seat or two in the House of Commons.

There are, as I have said, some among us who look upon this severance of the working-classes from the political party to which they appear naturally to belong as embarrassing, and as another and a serious element in the Liberal disunion of the time. There are others, mainly the few restless, bitter spirits of the Positivist persuasion, represented by Professor Beesly and Mr. Harry Crompton, who hail the severance with joy as tending, no matter how remotely, towards the realization of their spiritual and political aspirations. But the majority, I think, of political observers look with equanimity upon this new departure, and would not be sorry to see a proportion of workingmen in the House of Commons, provided that they were bonâ-fide workingmen (such as Mr. Burt, the member for Morpeth) and not unscrupulous agitators or mere political adventurers. The aristocracy, they consider, have had their day, and the old Reform Act curtailed their privileges by admitting to the legislature the representatives of the middle classes. The middle classes have had their swing during the five-and-thirty years which elapsed between the passing of the two Reform Acts, and now it is only fair that the working-classes should have a turn. Lord Grey's Reform Act did not destroy the influence of the aristocracy. It only clipped their wings, and, arguing on the same analogy, they say that Mr. Disraeli's Reform Act will not destroy the influence of the great middle class. It will only lessen its omnipotence. This seems to me a not unreasonable way of looking at the matter.

P.S.—Since this letter was written, Mr. Gladstone has definitely resigned the leadership of the Opposition, and the newspapers and the clubs are singing a requiem over his political ashes, and are abusing, openly or covertly, those of his own party who have helped to dethrone him. Sir William Harcourt is at this moment the most unpopular man in England, but he will, I dare say, survive his unpopularity, It is a pity to make so much of him. What will be the next paragraph in the Liberal programme it is difficult to say. Lord Granville is the acknowledged leader of the

party, but who will lead in the Commons? Such opinions as I have been able to gather point to something like a Whig revival such as I suggested in my letter of October 29, under Lord Granville in the House of Lords and Lord Hartington in the House of Commons. The political history of the last forty years, if it is to repeat itself, points at something of the kind. After the old Reform Act a strong Radical government, which did great things, was followed in 1841 by a strong Tory government like the present. That was followed by a political lull under the management of the Whigs. Then came the new Reform Act, the late Radical government which did great things, and a strong Tory government which is now in power and likely to remain. If in the ordinary cycle of events we are to have a political lull under Whig management or its modern equivalent, we cannot have better managers than Lord Granville and Lord Hartington. It may, however, be under the Liberal-Conservative management of Lord Derby and Sir Stafford Northcote, but in this case I should anticipate that Lord Salisbury and Mr. Gathorne Hardy would be independent members of their respective Houses, and Sir William Harcourt and not improbably Mr. Lowe would occupy their places in the administration. And though I should not despair of the commonwealth in either of these contingencies, I should be curious to see the permanency of the revival tested when the Radicals are sulky, the working-classes in open hostility, and Mr. Gladstone and Mr. Bright sitting, not on the front bench but in the body of the House, and candidly criticising the management of affairs.

# Correspondence.

## A DISPUTED RAPHAEL.

To the Editor of The Nation:

Sir: An acquaintance with Mr. Morris Moore, extending over the greater part of a year (1870-71), during which time I enjoyed frequent opportunities for the study of his very beautiful Raphael, the "Apollo and Marsyas," gives me a right to ask for space in your columns to reply to an article on the subject of Mr. Moore and his picture printed in the *Nation* of December 31. You place Mr. Moore's conduct and temper, in the controversy that was raised over his picture, in a very unfavorable light. But, granting that what you say be true, I, for my part, cannot see what a combative temper, and an old-fashioned liking for calling "a spade" "a spade," can possibly have to do with the genuineness of his Raphael or with his merits as a connoisseur. Different people have different ways of meeting assaults upon their characters and efforts to ruin their fortunes; but the list of good men and true who have expressed their feelings toward their enemies in Old-Testament English and in the Old-Testament temper is too long that Mr. Moore need be ashamed to add his name to it. If, however, he should see your notice of him, and should feel the need of a friend to sympathize with him as he reflects upon it, he may perhaps find some comfort in reading, a little further on in the same number of the *Nation*, your opinion of General Butler, whom you call—in English that I, for one, being no prude, do heartily approve—"one of the greatest rascals in the country—a liar, a cheat, and a demagogue." But when you try to put Mr. Moore in an unfavorable light by quoting the rough words he used towards Passavant, Waagen, and the rest of the "honest Germans" whom Prince Albert brought into England and set up in business, to England's great detriment, you leave the impression that Mr. Moore was a wolf, snarling and showing his teeth at a soft flock of gently-bleating German lambs; whereas the truth is they were as rough as he, and repaid him curse for curse, with usury thereto. "Vil menteur," "infame espion," "idiot and liar," cries Mr. Moore. "Libeller," "shameless," "base calumniator," "no lying invention too base," shout, in high German chorus, the lambs aforesaid. "Mr. Moore," however, as you justly observe, "seems to have had a bellicose temper," and the vituperations of his adversaries were the result, no doubt, of their German honesty. But let all this pass. Now that you have borne your testimony, pray allow me to bear mine, and to declare that, while everybody who knows Mr. Moore personally knows that he is a gentleman, accustomed all his life to the society of gentlemen, to which he was born and bred, he is also, not merely, as you charily allow, "a gentleman with some claims to a knowledge of art," but a true connoisseur with, in addition to great natural sensitiveness in art and a trained judgment, a wide and deep acquaintance with Italian art. He has gained this acquaintance in the only way in which it can be gained—not from the depths of his moral consciousness, not from books, though he is a close student, but at first hand, in the course of a long life spent in galleries and churches, not only in Italy—which he knows from end to end—but in England, France, and Germany. He is the most unassuming of men, and will talk about anything with strangers rather than about art. He worships his Raphael, it is true, but he never asked anybody to come and see it—he has denied formally, over his own signature, that he ever asked Passavant to come and visit him or to give his judgment on the "Apollo and Marsyas"—and you might be all day in the room with his pictures, where they stand closely curtained, and never see them unless you asked permission.

Mr. Moore does not need my defence, and perhaps will not thank me for it. Nor would his Raphael need vindication any more than he if he had not brought down official ire on his head by his long, persistent, and partly successful war against Sir Charles Eastlake, who, as Director of the National Gallery, was responsible for the ruinous "cleaning" of the finest pictures in the collection. Mr. Moore twice compelled a Parliamentary enquiry into this matter of the "cleaning," and twice brought about Eastlake's resignation; but, as the protégé of Prince Albert, he was immediately reinstated (an English counterpart of Boss Shepherd and the Court of Claims), and that, too, in spite of remonstrances from men and journals that ought to have been listened to. Eastlake, besides his share in the ruinous picture-cleaning, had wasted the nation's money and lost its opportunities. He had bought for £600 a spurious Holbein, which was found out too late, got rid of at a heavy loss, and the blunder bundled out of sight. He had failed to buy the "Manchester" Michelangelo (always called a "Ghirlandajo," till Mr. Moore, in 1853, declared its true authorship), which was offered him for £500, and which he would not have at any price. It was in the thick of this losing battle of his with Mr. Moore that a double misfortune befell him: first, the discovery by Mr. Moore of this exquisite Raphael, and, on the heels of that, the discovery in the Venice Academy of the original drawing for the picture. The whole force of Government and official lie-power was turned on to prevent people from believing that Mr. Moore had bought a Raphael, at auction, and for a small price. And certainly, if ever lying were justifiable, it was in order now, when there was question of a picture admitted even by "honest Germans" to be "unquestionably a first-rate specimen of the finest period of Italian art," which had been on view for six whole days at Christie's, free in the sight of all London, and seen there by Eastlake himself, who pooh-poohed it and passed it by with "curious," thus adding another to his already fatal list of sins of omission and commission. Led solely by my interest in this picture, and with no personal end in view whatever, I have studied this uncomfortable story from end to end in blue-books, newspapers, and pamphlets, and my own mind is clear that if Passavant, or Waagen, or Eastlake had discovered the "Apollo and Marsyas," it would have been at once awarded its true rank and name, and been lodged in the National Gallery as one of its choicest treasures.

Permit me, too, a word about Passavant. This is not the place in which to show him up fully, but every one who goes to it for information he cannot find elsewhere will learn for himself the value of his absurdly overrated book, the 'Life of Raphael.' For a foot by which to judge this dry-asdust Hercules, take the following bit of independent testimony: Mr. George Edmund Street, the distinguished architect, in his 'Gothic Architecture in Spain' (Preface to Ed. 9, 1869, p. vii.), writes: "Passavant, who has published some notes on Spanish architecture ('Die christliche Kunst in Spanien'), is so ludicrously wrong in most of his statements that it seems probable he trusted to his internal consciousness instead of to personal inspection for his facts." And Mr. Wornum ('Life of Holbein,' p. 50) exposes the ignorant credulity of Passavant and Waagen in another matter. As for the 'Life of Raphael,' it is not, in any true sense, a life at all, but a mere catalogue of Raphael's works, often incomplete, often wanting in essential facts—an ash-heap, where no ember of sympathy with his subject, no spark of perception, no living suggestion, rewards the searcher. The book itself is unsatisfactory enough, but you must permit me to wonder at your remark—"in the English translation published in 1872, no attempt is made by the translator to dispute Passavant's opinion"—that is, the opinion adverse to Raphael's authorship of the "Apollo and Marsyas." This English translation is a mere piece of hack-work made for the Christmas holidays by some person whose name the publisher has not thought it worth while to give, and who evidently knows only enough German to put it into awkward English with the help of grammar and dictionary. The author of this piece of not very creditable job-work doubtless little thought that he would ever be called into court as a witness.

As briefly as I can, I will now take up the remaining points in your article to which I demur. You assert that the picture "was ascribed to Mantegna." For the credit of connoisseurship, I am glad to be able to assert most positively that this manifestly absurd ascription was never made by anybody. For I do not call that an ascription which

comes in such an accidental way as this. The picture belonged to a Mr. Duroveray, who was never "a dealer," I believe, but, if he were, this picture was never offered for sale by him; but, having a particular affection for it, he always kept it hanging in his dining-room. When he died, it was sent to Christie's with his other pictures to be sold. The "Apollo and Marsyas" came to the auctioneer without any artist's name attached to it; but the exigencies of catalogue-making demanded a name, and some one suggested that of "Montagna," an early Italian engraver, remembering, no doubt, his little etching of "Apollo and Marsyas," of which a facsimile may be seen in Ottley's 'Early Italian Prints.' In the MS. of the catalogue, this name was accordingly given to the picture; but between the printer and the proof-reader it was changed in the printed catalogue to the more familar "Mantegna." I have seen a letter from Mr. Christie himself to Mr. Moore, giving this simple explanation, and this is all the foundation there ever was for the statement that the "Apollo and Marsyas" was ascribed to Mantegna.

Nor did Count Cicognara, a justly-esteemed connoisseur, ever attribute the *drawing* in the Venice Academy to Benedetto Montagna. He, too, in examining the collection of drawings, and coming upon this one, remembered that Montagna had engraved the same subject, and, merely as a memorandum, wrote on the margin, "B. Montagna." Only this and nothing more. If, however, Cicognara did intend to attribute this drawing to Montagna, what must be thought of his claims to connoisseurship? Count Henri Delaborde, a good authority, thus disposes of this matter in the *Revue des Deux Mondes* for July 15, 1858: "Il est au moins vraisemblable qu'en inscrivant le nom du graveur sur le dessin, Cicognara aura voulu noter un souvenir personnel ou indiquer une comparaison à faire entre les deux ouvrages. Comment supposer en effet, qu'un juge aussi expert ait cru reconnaître ici la manière de Montagna, manière bien différente à tous égards, bien éloignée de cette délicatesse et de cette grâce?" We are not left, however, to suppositions. The sub-director of the Academy, M. Andrea Tagliapietra, who was present when Cicognara wrote the name of Montagna on the drawing, has testified that it was merely a memorandum of reference, and M. Francesco Zanotti, who was secretary to the Academy during Cicognara's presidency, has also asserted the same thing.

Let me now select from the mass of testimony for Raphael's authorship, from the list of names that among others contains those of Minardi, Flandrin, Delaborde, Paul Mantz, Steinle, G. B. Cavalcaselle, Marianecci, J. J. Jarvis, W. W. Story, Seymour Kirkup, Cornelius, and Overbeck, the last two, as being Germans, as "honest," no doubt, as Passavant, and certainly as good judges as he of painting. Cornelius writes, "It would have been a piece of the highest good-fortune for art if there had existed another painter equal to Raphael who could have executed such a work as this." And Overbeck exclaims, "We have no need of documents, signatures, sketches, or studies of any sort to assure us that this precious painting, the 'Apollo and Marsyas,' is from the very hand of Raphael himself. In this work the young master cries with a lofty voice to all the world, 'As here Apollo presents himself already sure of the victory over Marsyas, so my genius here exalts itself above all comers, to conquer everything that ever was created in art.'"

As to the question, what is the money-value of this picture, supposing it to be allowed a work of Raphael, I would offer the following considerations. I never heard Mr. Moore say what he would sell the "Apollo and Marsyas" for, nor did I ever hear any of his friends say. In fact, well as I knew Mr. Moore, I never spoke to him on the subject. He is not a dealer, nor ever was, but a poor man living on a small inherited income, and yet rich in the possession of some valuable pictures which his skill as a connoisseur and his intimate knowledge of Italy have enabled him to acquire. He has occasionally sold a picture to raise money, just as Mr. Ruskin sold the "Slave-ship," and is all the time selling Turners and copies of Turner to raise the money when he needs it. But I never heard Mr. Ruskin sneered at as "a dealer," nor insulted as valuing his Turners at *bric-a-brac* prices. I do not believe that Mr. Moore ever tried to sell his picture for 500,000 francs. But, if he did, it is certainly not too high a price. There are few Raphaels more beautiful; none that can now be bought. It belongs to his best time. It contains the most considerable landscape he ever painted—a landscape, to use your own words, "rich, varied, and exquisite." It contains two figures, each full-length. It is in perfect condition, the panel on which it is painted being neither warped nor shrunk nor cracked; and the picture itself has never been touched by the cleaner or the restorer. It is one foot three and a half inches in height by eleven and a half inches wide, exactly the size of Raphael's "Vision of Ezekiel" in the Pitti Palace. These being the facts, compare with it the "Madonna del Libro," formerly the chief treasure of the Connestabile palace in Perugia. This is a little circular picture, seven and a half inches in diameter, about the size of the top of a man's hat. The Virgin is shown at half-length; she holds the Child upon her lap, who is shown in full. There is but little landscape seen. This picture was for a considerable time offered for sale, and when it was bought in 1870 by the Empress of Russia as a birthday gift for her husband, she may be said to have bought it in open market, and to have competed with all the galleries, private collectors, and crowned heads of Europe. Yet she paid for this little piece 330,000 francs. If the "Apollo and Marsyas" be certainly by Raphael, it would seem to be worth at least 220,000 francs more than the "Madonna del Libro," supposing that you are rightly informed as to Mr. Moore's estimate of its money-value.—I am, Sir, respectfully yours,

CLARENCE COOK.

NEW YORK, January, 1875.

---

[We are glad to print Mr. Cook's testimony to the excellence of the little picture which, as we understand, Mr. Moore proposes to offer for sale in America. But we must repeat what we said in our original note concerning it, that there is *no* historical evidence to support the claim that it is the work of Raphael. On the assumption that it was painted by so famous a master, this lack of external evidence and the entire absence of tradition are difficult to account for. The temper of Mr. Moore, as shown in the manner of his assertion and maintenance of his conviction that the picture is by Raphael, is of more importance in the question concerning the authenticity of the work than Mr. Cook allows. It affects the confidence to be placed in Mr. Moore's judgment. The ablest connoisseur, free from all prepossession, is often at fault in the determination, from internal evidence alone, of the author of a work of art. In the present case the bias of possession and the personal interest at stake, both in respect to reputation and to money, must be taken into account. They would weigh for little had Mr. Moore, in the controversy that has been carried on concerning his picture, exhibited a calm and judicial temper. His ill-temper and bad manners have very likely done him wrong; they have certainly done harm to his cause, for the loss of temper by an advocate is apt to be regarded as a sign of his consciousness of the weakness of his case. Our correspondent must pardon us for remarking that the vulgar abuse of a respectable opponent is hardly to be excused on the ground that such phrases as "vil menteur" and "infame espion" are "Old-Testament English." The picture must stand on its own merits. They are doubtless great. An agreement of connoisseurs in respect to its author is not to be expected. The question whether or not it came from the hand of Raphael will remain an open one till evidence of a different sort from any now known to exist is brought forward. We can print nothing more on this subject from any quarter.—ED. NATION.]

---

# Notes.

KNIGHT'S 'American Mechanical Dictionary,' published by subscription by J. B. Ford & Co., and issued in parts, is now in its third volume, and will make about 2,500 pages in all, being completed probably in June. The engravings are most profuse (no less than 4327 up to the word *Rifle*), and none of them superfluous. The author is editor of the Patent Office *Official Gazette*, and has had unusual facilities for becoming acquainted with the achievements of American inventiveness.——Gen. James H. Wilson, writing from London, calls our attention to a typographical error in our necrology for 1874 (p. 10 of No. 497). The name of the late U. S. minister to Bolivia was there given as Gen. John T. *Cuxton*, instead of Gen. John T. Croxton—"a true patriot, a good citizen, an accomplished scholar, and a most gallant soldier, whose merits were only surpassed by his modesty."

—We are informed by Mr. Henry Wallis, who writes from 24 Brecknock Crescent, London, N.W., that the Mantegna photographs have been delayed by the ordinary mechanical difficulties in printing from such large plates by the permanent process, as well as by the very unfavorable light of the present winter season. "During the last four months," says Mr. Wallis, "our photographer has hardly succeeded in finishing as many sets. The one satisfactory thing is that the series makes a splendid work of art. Of

course the decay of the original pictures must be regretted. Still, enough remains adequately to show Mantegna's genius." Due notice will be given American subscribers when the prints are ready for delivery.

—The Philadelphia Board of Public Education have put into practical operation the method of enquiry as to public-school health suggested by Dr. Lincoln, of the American Social Science Association, and urged upon the Board by the Philadelphia Social Science Association. Two circulars have been issued, one addressed to the principals of the public schools in that city ; the other to the local boards of school directors, requesting the appointment of a competent medical man to pursue the investigation of the hygienic conditions of the schools and the scholars. The first is arranged in seventeen questions, bearing upon the number of scholars and their distribution in rooms, the means of ventilation, the arrangement of light, the condition of the eyes of the pupils, the desks and seats in use, the general health of the school, and the average temperature of the rooms. The second is intended to be answered by a physician, and the questions, thirteen in number, are more technical—as to the average number of cubic feet to each pupil, the sensible condition of the air, the sufficiency of light, the system of ventilation, the appearance of the scholars, the kind of desks in use, and the cleanliness of drains, cellars, and privies. If the returns to these circulars are full and complete, the amount of information obtained will be very great, as the city of Philadelphia has four hundred public schools and one hundred thousand pupils. In order to attract attention to this enquiry, the Philadelphia Social Science Association will hold a meeting, at which Dr. Castle, an ophthalmologist of recognized skill, will read a paper on diseases of the eye peculiar to schools, illustrated by diagrams and drawings.

—It is Winnecke's comet and not Encke's, as the Boston papers have it, which has appeared lately in the morning. Encke's comet does not appear in the morning, but after sunset, and will soon be bright enough to be seen with an ordinary telescope ; whereas Winnecke's is so faint, even at its maximum brightness, that fears were entertained by European astronomers that it might not be found at all, even by the most powerful glasses. Fortunately it has been found and observed, as we learn from the Boston *Transcript*, at the Harvard Observatory, and found "very near the predicted place," which we suppose must refer to the carefully computed ephemeris of Dr. Oppolzer of Vienna, who has given special attention to the theory of this comet. Winnecke's comet owes its importance not to its magnitude or brightness: it furnishes new material for determining by its perturbations the mass of Jupiter. It will appear again in 1880, but as the conditions for observing will be more unfavorable than at this appearance, it is well that it has been observed now.

—The *Revue des Deux Mondes* for January 1 contains an interesting article on the eucalyptus globulus, or blue-gum of Tasmania. It will be read with disappointment, however, by cultivators of the tree in this country who hope to obtain some light on the climatic conditions essential to its flourishing away from its native seat. The writer, M. Planchon, insists on the distinction that trees may be naturalized but not acclimated. They will either grow or not grow in a given locality, and experience alone can determine what region is suitable for them. Nor is there necessarily a reciprocity in this naturalization of plants and vegetables. From England, for example, numerous wild and cultivated plants have passed to Australia and thriven there, though generally deteriorating ; but not a single Australian species has yet been propagated in England outside of ornamental gardens, where they are cultivated by thousands. Even in Southern Europe and Northern Africa, all that can be said of the eucalyptus is that it has been introduced but not yet naturalized—in other words, it still requires the care of man. The experience of the Cape of Good Hope, the Argentine Republic, of Cuba and California, is passed over by M. Planchon, who confines his attention to the shores of the Mediterranean. In Algiers the giant tree has prospered wonderfully, and already has given a new character to the landscape. Twenty years ago it grew there unknown, but cultivation on a large scale and with a purpose was not attempted till 1861–62. It now lines the railroads and highways, and is observable singly, in clumps, and in groves, so that it seems like part of the indigenous vegetation. In the south of France it thrives only where the orange tree does without artificial shelter, *i.e*, in the Eastern Pyrenees, the Var, and the Maritime Alps ; the best-known sites being Hyères, Cannes, Antibes, Nice, Villefranche, and Monaco. Open-air cultivation has been tried at Montpellier, Marseilles, and Narbonne, but not without great risks and disappointments ; and M. Planchon decides adversely on the climate of Languedoc and even of the western portion of Provence.

—In our Southern States the chief hope reposed in the eucalyptus is that it will overcome miasmata ; and not without reason. The "fever-tree" is the name given it in Spain by the people of Valentia from a practical acquaintance with its properties. Not only does it absorb immense quantities of moisture from swampy soils, and give off a balsamic effluvium, but it furnishes the *materia medica* with a substance which is a febrifuge in the case of a large number of intermittent fevers ; it has disinfecting and antiseptic qualities ; topically applied to wounds it promotes cicatrizing ; its leaves in a moderate infusion will supply the place of tea as a stimulating beverage, and rolled into cigarettes they have a soothing effect on the respiratory organs. Prosper Mérimée is said, in his last illness at Cannes, to have derived benefit in this way from the smoking of them. The eucalyptus essence has also been administered for bronchial affections in the form of lozenges; and a toilet article, of a powerful and very persistent odor, has been made of it. Great as are these uses, the tree is perhaps still more to be welcomed for its timber. Its rapid growth is not incompatible (as is usually the case) with a compact texture, whose value is heightened by the presence of resinous substances, eminently adapting the wood to resist salt water, and thus to play an important part in naval architecture. For the same reason it does not rot in the soil, and is used for railway sleepers, for posts and piles, for bridges, viaducts, etc., etc. Some of the allied species of the eucalyptus globulus are taller than it is, though mention is made of a blue-gum plank nearly 170 feet long. A single eucalyptus amygdalina has been known to surpass in height the Strassburg spire and even the Great Pyramid. For further particulars respecting the subject of this Note we must refer to M. Planchon's article, which is remarkable, considering that the author is a Frenchman, in suggesting how certain peculiarities of the blue-gum lend support to the development theory of the natural creation.

—On the 1st of January the thaler ceased to be the monetary standard of Germany, and the mark valuation was generally introduced. Three German *Reichsmark* in gold are equivalent to a thaler, 1,395 of the former being coined from a pound of fine gold. As the change now introduced still involves the gradual withdrawal of silver currency to the amount of three hundred million thalers, some time will elapse before the thaler will be virtually displaced by the reichsmark, and thus for the present in Germany, as in France, Belgium, and Switzerland, the double standard of gold and silver may be said to exist. And like these countries, Germany experiences at the outset considerable difficulty in maintaining the equilibrium between the two standards, owing to the disturbance in the relative values of gold and silver. France, Belgium, and Switzerland coin 200 francs from a kilogram of silver, $\frac{9}{10}$ fine, and 3,100 francs from a kilogram of gold of the same fineness, thus legally fixing the relative values of gold and silver as 1 : 15½ ; and Germany, in substituting the gold for the silver standard, has taken the same proportion as a basis. Now, in reality, silver has for the past few years been steadily declining in value, so that a kilogram of fine gold has actually been worth more than 15½ kilograms of fine silver, and speculative bankers have not been slow in taking advantage of this decline. They have found it quite profitable to buy silver at its present low price in London, paying for it in Napoléons d'or, and having it coined in France into five-franc pieces. In this way they have received for a kilogram of gold at least 16 kilograms of silver, the gain amounting to ½ kilogram of silver, the expenses incurred being inconsiderable. The consequence of this continued exchange of gold for silver has been that France, Belgium, and Switzerland have been all but completely drained of their gold. The reverse took place in these countries at the time of the discovery of gold in California and Australia, when gold rapidly declined in value, silver almost disappearing from circulation. With the introduction of the gold standard in Germany a new field of speculation has been opened to English bankers, who, ostensibly for their trade in India and China, have lately bought large quantities of silver thalers, and now, by exchanging them in Berlin for gold at the rate of three marks for one thaler, derive a handsome profit from the operation. The German Government discovered too late that it had committed a great mistake in not melting its superfluous silver, and selling it in bars to London bankers, thereby preventing its reflux into the German Treasury.

—There is, in fact, no good reason why Germany, in establishing the relative values of its gold and silver currencies, should have adhered to figures which are so much at variance with the actual market value of the two metals, and disregarded the example offered by other countries. In the United States, since Congress first fixed the relative values of gold and silver at 1 : 15, the figures have been repeatedly changed to 1 : 16, 1 : 14.88, and 1 : 14.95. So great has been the demand for gold on the Prussian bank that its provisions have been found quite unequal to the occasion, and

in consequence there is a project on foot to hand over the entire administration of monetary affairs in Germany to a new *Reichsbank*, with the power of increasing or decreasing the currency in circulation, as occasion may require. The new bank is to have a capital of 40,000,000 thalers, the Government guaranteeing to the shareholders 4½ per cent. interest on their shares, and reserving to itself one-half of the profits above this percentage. Along with the change in its monetary affairs, a curious reform has taken place in the postal service of Germany. All the foreign words of which until now the German postal vocabulary has been composed have been carefully weeded out of the language, and are replaced by purely German words. But the innovations are not in all cases happy, and some of them, such as the barbarous *postlagernd* for the universally-used *poste restante*, the German *Schulmeister* ought to look after.

—The historical literature of the year 1874 is unusually rich. Of writers who are recognized as standing in the first rank, or nearly so, in this department, we have new works or new instalments from Mr. Motley, 'History of John of Barnevelt'; Mr. Bancroft, Vol. X.; Mr. Parkman's 'Old Régime in Canada'; Vol. V. of the translation of Curtius's 'History of Greece,' closing the work; Von Sybel, 'Die Revolutionszeit,' Part 1 of Vol. V., embracing the year 1798; Giesebrecht, 'Die Deutsche Kaiserzeit,' Vol. IV., Part 2, completing the reign of Conrad III. The fifth volume of Long's 'Decline of the Roman Republic' finishes his work at the death of Julius Cæsar; the fifth volume of Ewald's 'Volk Israel' does the same, reaching the time of Christ; Hausrath's 'Neutestamentliche Geschichte' is also brought to a close with the time of Hadrian (Vol. III. Part 2), as is Eberty's 'Geschichte des Preussischen Staats,' whose seventh volume comprises the period from 1815 to 1871; J. G. Droysen's 'Geschichte der Preussischen Politik' has reached the time of Frederick the Great; and the most important recent volumes of the new edition of Ranke's collected works are the 'Twelve Books of Prussian History'—nine in former editions, the enlargement being chiefly in the earliest times; Hefele's 'Conciliengeschichte' ends (Vol. VII.) with the Council of Florence (1439), and the first volume has already reached a new edition; Arnold Schäfer's 'History of the Seven Years' War' has reached the second part of Vol. II. In the field of constitutional history we have at least four books of the very first rank—the first volumes of Marquardt's 'Römische Staatsverwaltung' (Organization of the Empire); the first part of the second volume of Mommsen's 'Römisches Staatsrecht' (the Magistrates); the fifth volume of Waitz's 'Deutsche Verfassungs-Geschichte,' embracing the period of the Saxon House; and Vol. I. of Stubbs's 'Constitutional History of England,' reaching the Magna Charta. Mr. Freeman has published very little during the year—a ground for hope that his fifth volume is making progress. His 'Historical Series' has had added to it histories of Italy, by Mr. Ward, and Germany, by Mr. Syme. The commencement of Mr. Morris's series, 'Epochs of History,' is an event of no slight importance; the volumes, although small, contain the ripe results of men who are authorities in their respective fields. The four volumes already published are 'The Protestant Revolution,' by Mr. Seebohm; 'The Crusades,' by Mr. Cox; 'The Thirty Years' War,' by Mr. Gardiner; and 'The Houses of Lancaster and York,' by Mr. Gairdner. Mr. Cox has also published two volumes of a history of Greece, reaching to the year B.C. 404.

—Of other histories of value we may mention Lenormant's 'Les premières Civilizations,' being a presentation of the most recent results in the field of prehistorical archæology and in the histories of Egypt, Assyria, etc. Markham's 'History of Persia' also belongs to Oriental history, and Schneiderwirth, 'Die Parther,' and Hoffmann, 'Antiochus IV., Epiphanes.' In classical history there is little besides that already mentioned, except Stahr's 'Tiberius,' which has excited great attention on account of its attempt at vindicating the character of this emperor. Mr. Bosworth Smith's lectures upon Mohammed have received high praise. Simson's 'Jahrbücher' of the reign of Louis the Pious is a valuable addition to the valuable series of 'Jahrbücher' of the Emperors. Of local histories there are Ralston's 'Early Russian History'; Von Muchar, 'Geschichte der Steiermark,' Vol. IX. (finished); Sprecher, 'Die Republik der Drei Bünde'; Fock, 'Aus der letzten Tagen der Pommerschen Geschichte,' Vol. VI. Kraus's 'Lehrbuch von Kirchengeschichte' (Trier) is pronounced an excellent compendium from a Catholic point of view. Prof. Fisher's 'History of the Reformation' has received warm praise from nearly all quarters. Karl Fischer's 'Geschichte der auswärtigen Politik und Diplomatie im Reformationszeitalter' is a valuable contribution to the history of this period, and so are Maurenbrecher's 'Studien und Skizzen.' The eminent historian Gregorovius, having completed his 'Geschichte der Stadt Rome,' has published a life of Lucrezia Borgia, in which this notorious woman is shown to have been rather a commonplace character, and innocent enough, considering her time and surroundings. We describe below a life of 'Lorenzo the Magnificent,' by Von Reumont. Prutz's 'Geschichte des Kaisers Friedrich I.' is too important a work to be passed over, although it is thought hardly worthy of its subject. Mary Queen of Scots has received unusual attention in the third closing volume of Hosack's work in her defence, in Petit's 'Mary Stuart,' also in vindication of her, and in the publication of the letters of Sir Amyas Paulet. We will also mention a second series of 'Historical Essays' by Van Praet; a 'History of Japan,' in two volumes, by Mr. P. O. Adams, formerly British Chargé d'Affaires at Yedo; Mr. Stillman's 'History of the Cretan Insurrection'; Green's 'Short History of the English People'; Von Holst's 'History of the United States'; Otté's 'History of Scandinavia'; the commencement of Mr. Hubert H. Bancroft's 'Native Races of the Pacific Coast'; and 'The History of the Late War,' by the Comte de Paris. Works in this field are also Flint's 'Philosophy of History' (Vol. I.), and George's 'Genealogical Tables,' published by Macmillan. The most prominent of historians dead during the year have been Michelet, a brilliant and learned historian, who had, however, probably finished his work; Prof. Usinger of Kiel, an industrious and useful man; and above all Guizot, than whom no other living man ranked higher in this field, unless Ranke and Mommsen. His 'History of France' was left in a condition to publish to the end.

—The last number of the *Jahrbuch für romanische und englische Sprache und Literatur* (Neue Folge, II. Bd. 1 Heft), contains several articles of interest to students of English literature. The first is a new text of the Legends of St. Dunstan and St. Christopher, from the Laud MS. 108. The earlier text was from the Harleian MS. 2,277. The former, though somewhat fragmentary, is, as far as it goes, more complete and probably more like the original copy. In another article, E. Schmid discusses Marlowe's 'Faust' and its relation to the English and German Faust books. It has generally been supposed that Marlowe took the material for his play directly from the German popular Faust book. Schmid, however, shows by a collation of the play with the German and English Faust books, that Marlowe must not only have known the latter but used it for his tragedy. H. Böddeker contributes a valuable article on English Songs and Ballads of the Sixteenth Century, which are contained in a MS. (Cotton. Vesp. A. 25) of the British Museum. Some of these have already been published by Wright and Halliwell in their 'Reliquæ Antiquæ,' but most of them appear here for the first time. The editor reserves for a future number the question of the dialect in which these songs and ballads are written. One of the shorter ones is so pretty that it will bear repeating, although it has already seen the light in Halliwell's collection. It is entitled "Change":

> "After droght commythe rayne,
> After plesur commethe payne,
> But yet yt contynythe not so.
> For after rayne
> Commythe droyght agayne,
> And joye after payne
> And woo."

—Alfred von Reumont, the distinguished German diplomat and scholar, formerly minister at Rome and Florence, and author of numerous valuable works on Italian history, literature, and art, has lately published, in two volumes, a history of Lorenzo de' Medici ('Lorenzo de' Medici, il Magnifico,' Leipzig), which will justly rank as his greatest work. Thanks to Mr. Roscoe's entertaining but extremely partial book on the same subject, there is probably no Italian of the fifteenth century so well known to the English public as Lorenzo de' Medici. Von Reumont's work embraces all points of view—historical, political, and literary—and perhaps no one was so well qualified to combine them in one book. His previous diplomatic career and profound studies in Italian literature and art have enabled him to produce a work of singular completeness, and which will be indispensable to any student of the fifteenth century. The first book gives a condensed account of the history of Florence to the death of Lorenzo's grandfather, Cosimo. The second book embraces the period from 1464 to 1470, the life of Piero and Lorenzo's youth. The conspiracy of the Pazzi, the war with Sixtus IV., and Lorenzo's famous journey to Naples fill the third book. The most interesting portion of the work for students of literature is the fourth book, which treats in the most detailed manner (occupying over three hundred pages) of letters and art during the fifteenth century, and offers some admirable metrical translations of various poems of Lorenzo. The fifth and sixth books complete Lorenzo's history with many interesting details of Florentine life. In several valuable appendices are given bibliographical notices, a chronological table, and genealogical charts of the Medici, Pazzi, Soderini, and Visconti-Sforza families.

—'Ch'o hok kai' is the title of a new hand-book of the Canton vernacular of the Chinese language, composed for domestic and business purposes

by N. B. Dennys. Mr. Dennys, who, we understand, has had the degree of Ph.D. conferred upon him by one of the German universities in recognition of his services to Anglo-Chinese literature, has attempted to meet a growing want. Hitherto, nothing worthy of the name of a "method" of learning Cantonese has ever been produced. That the present work has been adopted by the Hongkong Government as the text-book for its interpreters, police, and Government schools, argues that he has met with fair success. The work is handsomely got up, being issued from the *China Mail* press, whence also comes the *China Review*, a publication we have frequently noticed. Messrs. Trübner & Co. are the London agents of the 'Ch'o hok kai.' The last number of the *Review*, by the way, which has come to hand (Vol. III., No. 2) is unusually interesting. The leading paper is an account of audiences granted by the emperors of China to Western envoys since 1820. This is followed by one on the "noble art of self-defence" in China, based on a Chinese pamphlet professing to teach the art, and illustrated by comical native views of the *modus operandi*. "The Hsi Yuan Lu, or Instructions to Coroners," and M. Gubler's report to the French Academy on the Chinese materia medica, give one a glimpse of Eastern knowledge of anatomy and therapeutics, and this knowledge is more respectable than might be supposed, and more closely parallel or identical with Western notions of medicine, historic and actual. One finds not only our obsolete "doctrine of signatures" in full force with the Chinese, but also anæsthetical surgery of very ancient date. "Verily," as M. Gubler says, "we behold strange illusions; but they deserve indulgence, especially on the part of those whose ancestors have participated in them. When it was formally believed that Lungwort was a cure for phthisis, that Stone crop or Orphine expelled the gravel, and that the carrot dissipated the jaundice, modesty is a virtue indispensable to all."

## MILL'S ESSAYS IN RELIGION.*

MR. MILL'S theological speculations cannot be properly understood unless account be taken of his education and of his philosophy. Being educated outside all existing religious beliefs, he never dissented from creeds the truth of which he never admitted. He approaches every form of religion in the spirit in which an unbiassed enquirer might, say in the time of Cicero, have weighed the respective claims of Stoicism and Epicureanism, and hence occupies a position quite different from that of a man like Mr. Greg, whose whole views are by his own honest avowal colored by the influence of early association and training. His attitude is even more different from that of theists like Theodore Parker, whose vehement dissent from orthodoxy is in part an expression of fervent belief in the dogmas of theism. Mr. Mill, again, devoted his life to assailing all the forms of *à priori* thinking, and hence, when dealing with theology, naturally refuses all confidence to the *à priori* theories either of dogmatic orthodoxy or of equally dogmatic scepticism. All theological problems are therefore, in his view, simply forms of the one great question, What are the religious truths (if any) which men can discover by the application of reason to the phenomena of the universe and of human nature? and his conclusions are the natural, if not the inevitable, results of his position and his philosophy.

The first question for every religious enquirer must be, What ground (if any) is therefor the belief in the existence of a Creator? There are philosophers who answer this and every similar enquiry by the dogmatic assertion that all speculation about the nature and attributes of the Deity is futile, and ought to be cast aside by men who perceive the inherent weakness of the metaphysical method. Mr. Mill at once rejects the easy method of solving great problems which consists in the bold assertion that they are incapable of solution, and, after weighing the various arguments in favor of the existence of a Creator, pronounces them all worthless with the exception of the so-called "argument from design." To this argument he ascribes sufficient force to make the existence of the Deity, at any rate, highly probable:

"In the present state of our knowledge, the adaptations in nature afford a large balance of probability in favor of creation by intelligence. It is equally certain that this is no more than a probability, and that the various other arguments of natural theology which we have considered add nothing to its force. Whatever ground there is, revelation apart, to believe in an author of nature is derived from the appearances in the universe."

The belief in the existence of an intelligent Creator being granted, what are the Creator's attributes? This enquiry is one which has rarely received the full consideration devoted to it by Mr. Mill. For deists have, as a general rule, when once they have convinced themselves of the existence of God, been content to ascribe to him all the characteristics, such as benevolence, wisdom, and omnipotence, which religious persons consider the natural attributes of the Deity. That men should so easily have assumed that if a Creator exists he must infallibly possess the qualities both of omnipotence and perfect benevolence, is a curious proof of the slight extent to which even sceptics have attempted to form what we have heard described as an "inductive idea" of God. The easy assumption by which the mere existence of a Being, however great and powerful, is taken to be proof of his possessing certain attributes, is at variance with Mr. Mill's fundamental principles. Any one, he in effect argues, who infers the existence of a Creator merely from the phenomena of the universe, must of necessity attempt to discern his character by studying the nature of the universe, and by that process alone. If you "work through nature up to nature's God," you must infer him to be of such a character as he exhibits in the works of nature. Once admit this, and you are (as Mr. Mill maintains) driven to the conclusion that the Being by whom the world was created cannot be at once absolutely benevolent and omnipotent. The existence of any suffering whatever is sufficient to support this thesis. The admitted existence of a vast mass of suffering proves it to demonstration.

"Writers on natural theology have exhausted the resources of sophistry to make it appear that all the suffering in the world exists to prevent greater; that misery exists for fear that there should be misery—a thesis which, if ever so well maintained, could avail to explain and justify the works of limited beings, compelled to labor under conditions independent of their own will, but can have no application to a Creator assumed to be omnipotent, who, if he bends to a supposed necessity, himself makes the necessity which he bends to. If the maker of the world *can* all that he wills, he wills misery, and there is no escape from the conclusion."

From this hateful inference Mr. Mill escapes by the bold denial of the hypothesis on which it depends. That the Creator is infinitely more powerful than man must be conceded by any one who believes in his existence; but that the Creator is, strictly speaking, "omnipotent" is a dogma not supported by the appearances of nature, inconsistent with the very argument from design from which the existence of creative intelligence is inferred, since that argument implies a subordination of means to ends, and, lastly, opposed not indeed to the verbal statements, but to the religious consciousness of even the most orthodox believers, who have in effect always been prepared to save the goodness of the Creator at the expense of his power. "There is, further, a distinct preponderance of credence that the Creator desired the pleasure of his creatures." His works, in other words, give proof of the benevolence of God. His omnipotence is a mere fiction formed by the human imagination. Reject the belief in his absolute power, and it is possible to entertain a creed which is at once rational and moral:

"One only form of belief in the supernatural . . . stands wholly clear both of intellectual contradiction and of moral obliquity, which, resigning irrevocably the idea of an omnipotent Creator, regards nature and life not as the expression throughout of the moral character of the Deity, but as the product of a struggle between untiring goodness and intractable material, as was believed by Plato, or a principle of evil, as was the doctrine of the Manichæans."

All Mr. Mill's powers of lucid exposition and happy illustration are devoted throughout at least two-thirds of his essays to establish the doctrine that a belief in the Creator's benevolence can be maintained only by disbelief in his omnipotence. A mere abstract gives a most inadequate idea of the skill and zeal with which this doctrine is enforced. It is obviously the central dogma of Mr. Mill's theological belief, and is, in *his* eyes, the sole refuge from either atheism or a creed far more painful to every good and benevolent man than atheism itself.

If the probable existence of a benevolent, if not omnipotent, Creator can be safely assumed, what are the grounds for belief in the immortality of the soul?

Mr. Mill's reply to this enquiry is in effect that no conclusive answer is possible. Independently of the existence and benevolence of God, no proof of man's immortality can be given, and the assumption both of the Deity's existence and of his good-will to man cannot afford any sure ground for the belief that he is able, even if he wishes to do so, to endue mankind with immortal life. "The benevolence of the Divine Being may be perfect, but his power being subject to unknown limitations, we know not that he could have given us what we so confidently assert that he must have given; *could* (that is) without sacrificing something more important. . . . One thing is quite certain in respect to God's government of the world, that he either could not or would not grant us everything that we wish. We wish for life and he has granted us some life; that we wish (or some of us wish) for a boundless extent of life and that it is not granted, is no exception to the ordinary modes of his government. Many a man would like to be a Crœsus or an Augustus Cæsar, but his wishes are gratified only to the moderate ex-

* 'Three Essays on Religion. By John Stuart Mill.' London: Longmans; New York: Henry Holt & Co.

tent of a pound per week or the secretaryship of his trades-union." Though there be no ground for believing in the immortality of man, there is also, it should be noted, no ground for disbelief. This is one of those rare cases in which there exists a total lack of evidence in favor either of an affirmative or of a negative conclusion. "There is in science no evidence against the immortality of the soul, but that negative evidence which consists in the absence of evidence in its favor." The attempts to prove that the soul cannot survive the body are, in fact, attempts to give to the teaching of a limited experience the force of absolute demonstration. "We must beware of giving *à priori* validity to the conclusions of our *à posteriori* philosophy. The root of all *à priori* thinking is the tendency to transfer to outward things a strong association between the corresponding ideas in our own minds; and the thinkers who most sincerely attempt to limit their belief by experience, and honestly believe that they do so, are not always sufficiently on their guard against this mistake." This caution, which is valuable in itself, has a most direct bearing on Mr. Mill's treatment of the last main topic of his essays, the right attitude of a rational man towards religious dogmas.

What should be the position taken up by a man anxious to believe the truth, and the truth only, towards the supernatural? This enquiry is the most interesting, and for practical purposes the most important, with which Mr. Mill deals. His answer is, however, by no means so clear as are the replies which he generally gives to the questions which he raises. It must, in fact, be admitted by any candid reader that Mr. Mill treats his topic in a different spirit in two different essays. The general effect of the treatise on the "Utility of Religion" is that a belief in the supernatural is, though permissible to a rational being, still of very dubious utility or advantage to mankind. The desire for immortality may, Mr. Mill urges, gradually expire, and the loss of this desire may, on the whole, be a benefit to the human race. "It seems to me," he writes, "not only possible, but probable, that, in a higher and above all a happier condition of human life, not annihilation but immortality may be the burdensome idea, and that human nature, though pleased with the present, and by no means impatient to quit it, would find comfort and not sadness in the thought that it is not chained through eternity to a conscious existence which it cannot be assured it will always wish to preserve." The tone of the later essay on Theism is different. The belief in the divine government and in the immortality of the soul is, if it can be rationally maintained, most beneficial to man. The truth of such belief, though only maintainable as a hypothesis, is still a supposition which cannot be disproved, and may be cherished by the most sober thinkers, not as a creed, but as a hope. This, which is true with regard to all the main doctrines of supernatural religion, is, as Mr. Mill contends, specially true of the hope of immortality. "The possibility of a life after death rests on the footing of a boon which this powerful Being who wishes well to man may have the power to grant, and which, if the message alleged to have been sent by him was really sent, he has actually promised. The whole domain of the supernatural is thus removed from the region of belief into that of simple hope, and there, for anything we can see, it is likely always to remain; for we can hardly anticipate either that any positive evidence will be acquired of the direct agency of divine benevolence in human destiny, or that any reason will be discovered for considering the realization of human hopes on that subject as beyond the pale of possibility." An indulgence in such hopes is, "while we recognize as a clear truth that we have no ground for more than a hope, legitimate and philosophically defensible. The beneficial effect of such a hope is far from trifling; it makes life and human nature a far greater thing to the feelings, and gives greater strength as well as greater solemnity to all the sentiments which are awakened in us by our fellow-creatures and by mankind at large." The following sentences conclude the essays, and sum up the last result of Mr. Mill's religious speculations: "To do something during life, on even the humblest scale, if nothing more is within reach, towards bringing this consummation (the final victory of good) ever so little nearer, is the most animating and invigorating thought which can inspire a human creature, and that it is destined with or without supernatural sanctions to be the religion of the future I cannot entertain a doubt. But it appears to me that supernatural hopes, in the degree and kind in which what I have called rational sceptism does not refuse to sanction them, may still contribute not a little to give to this religion its due ascendency over the human mind."

Nothing in the essays is more characteristic of Mr. Mill, and nothing of more permanent value, than the attack on the easy-going aquiescence with which mankind accept the dogmas of divine omnipotence without even perceiving the difficulty of combining it with a genuine faith in divine benevolence. What should be specially noted is, that Mr. Mill's attack on optimism is grounded not on a logical utility but on a moral feeling. The strongest and noblest sentiment of Mr. Mill's mind was a passion for justice. If such a feeling can by any possibility be termed exaggerated, we might say that his hatred of oppression reached excess. What he objects to in the popular view of the divine character is, that it is opposed to all sound ideas of justice. That any one man or Deity should cause or suffer to exist needless pain is, according to all human ideas, the height of cruelty and wrong. Pain, Mr. Mill argues, exists. The Deity is, according to the popular creed, omnipotent in the strictest sense of the word. He therefore causes pain to exist which is needless; since even supposing that the pain has an object, an omnipotent being must, *ex hypothesi*, be able to attain the object without causing the pain. You may, Mr. Mill in effect adds, go a great deal further than this. Not only does pain exist, but the whole universe is full of suffering, and of suffering which is manifestly unjust. If nature be looked upon as the simple expression of the Creator's character, the Deity may be feared for his power, but he cannot be adored for his goodness.

"Nearly all the things which men are hanged or imprisoned for doing to one another are nature's everyday performances. Killing, the most criminal act recognized by human laws, nature does once to every being that lives, and in a large proportion of cases after protracted tortures such as only the greatest monsters whom we read of inflicted on their living fellow-creatures. . . . Nature impales men, breaks them as if on the wheel, casts them to be devoured by wild beasts, burns them to death, crushes them with stones, starves them with hunger, freezes them with cold, poisons them with the quick or slow venom of her exhalations, and has hundreds of other hideous deaths in reserve, such as the ingenious cruelty of a Nero or a Domitian never devised."

The passage of which these sentences are a small portion constitutes a long and bitter indictment against the injustice of nature. In several ways it throws strong light on the extent to which Mr. Mill was influenced by the combined sincerity and passion of his mind. His sincerity makes it absolutely impossible for him to pass over or ignore the existence of bitter pain and suffering throughout the universe. But while Mr. Mill's attack on optimism has a force which will be recognized by many of those who do not agree with his theological speculations, no admiration for a great teacher can conceal from any candid critic that in his view of nature Mr. Mill suffered unconsciously from the bias of overwrought feeling. In the sentence already quoted, his passionate rhetoric conceals what is very rare with him—distinct inaccuracy of thought. Killing is not the most criminal act recognized by human laws. A soldier or an executioner kills, and he commits no crime whatever. Murder is a crime, but murder is not killing, but killing under certain circumstances and with certain feelings and intentions. To give pain, and even the most excruciating pain, is not necessarily, if one speaks accurately, to torture. Everything depends upon circumstances and motive. Similar criticisms may be applied to almost all of the charges preferred against nature. What Mr. Mill does show is, that nature causes agony of all kinds to living beings. To show this is to point out, if not an insuperable, yet a very considerable difficulty in the creed which attributes at once unlimited benevolence and unlimited power to the Creator; but when Mr. Mill proceeds to treat nature as a criminal summoned before the bar of a court of justice, he passes from the domain of reason to the realm of rhetoric, and, moreover, fails in making out his case; because whilst he does show that nature causes pain (which is only asserting in rhetorical language that animated beings suffer pain), he cannot prove the existence of a wrongful intention, without which there can be no crime. Nature, further, like the devil, may be painted far blacker than she is, and Mr. Mill, it must in fairness be admitted, has in drawing her picture laid on dark colors with much too unsparing a hand. The indignant strain also in which he writes is not at bottom consistent with his view of the Creator's attributes, for if his power be limited there is no ground for indignation at the existence of evils which, it is highly probable, are irremediable. Mr. Mill's sensibility, if it sometimes leads him astray, certainly widens his sympathies. In his last work there is traceable a very distinct leaning towards orthodox Christian doctrines. Christianity, whatever its defects, cannot be charged with optimism.

The belief in an evil spirit, which is, of all orthodox dogmas, the most repulsive to modern deists, has some attraction to a writer who sees in the universe a constant struggle of good and evil. Mr. Mill rejects it, but only after examining its claims to reception with calm consideration. His moral feelings kindle in his mind an admiration for the teaching of Christ, which is expressed in terms which obviously excite some astonishment among those who are the most ardent disciples of Mr. Mill's philosophy. Carlyle showed his insight when he described his friend as an unconscious mystic. In Mr. Mill's fervent admiration for the teaching and mind of Christ, in his manifest inclination towards the Comtist worship of humanity, in the outbreaks of passion which are to be found mixed up with his driest logical or economical speculations, there are abundant traces of

indisposition towards what in a very wide sense of the term might be called mysticism. Yet the character of Mr. Mill's intellect, if not of his disposition, was strictly logical, and he entertained and through life acted honestly on the conviction that the attainment of truth was a matter of the reason and not of the heart. Hence he sympathized with Christianity, and he examined its evidences with respectful attention; but when he found that, according to his tests of truth, these evidences were unsatisfactory, he refused his belief to a creed which appealed to some of his strongest sentiments. Orthodox critics may understand Mr. Mill's attitude towards orthodoxy by comparing it with his relation towards the dogmas of Comtism. That Mr. Mill was much attracted by some of those doctrines is past a doubt, and, if other evidence were wanting, the 'Essay on the Utility of Religion' is conclusive proof that at one time, at any rate, he swayed very far towards the religion of Positivism. It is equally clear that he did not accept the creed of Comte's later disciples. He tested its claims by his canons of truth, and in the case of Positivism, as in the case of Christianity, refused belief to a system which pleased his imagination without satisfying the requirements of his intellect.

It is, of course, open to any one to maintain that Mr. Mill's criteria of truth were unsatisfactory, that the premises from which he started were too narrow, or the conclusions which he drew from them unsound. All these are matters well worth the consideration of any who investigate the truth of his theological doctrines. With these matters we have no concern. Our object is not to defend or assail Mr. Mill's teachings, but to explain his attitude towards religious belief, and to call attention to the honesty with which, despite the influence of feeling, he adhered to his convictions. This sincerity, combined with his logical acuteness, has led to one result which perturbs his more sceptical admirers. He has applied to the favorite formulas of his own school the same canons by which he has tested the most orthodox and generally accredited doctrines, and has frankly pointed out that these formulas are often unsound. Nothing, for example, is a more decisive mark of so-called scientific thinkers than their readiness to dispose of the whole question of miracles by the summary assertion that a miracle is, from the very nature of things, impossible. Such off-hand solutions of difficult problems are Mr. Mill's abhorrence. He rejects the dogma on which so many of his followers rely, and, with something like grim humor, treats it as a specimen of that "*à priori* thinking" which, in his view, is the main source of philosophical errors. In the same spirit he rejects as untenable the assertion often made, and still more often confidently assumed, that life and consciousness cannot possibly exist apart from material organs. Here he sees not an undoubted truth but simply an example of the "tendency to transfer to outward things a strong association between the corresponding ideas in our own minds." But what gives the greatest shock to advanced thinkers is that Mr. Mill in effect, if not in so many words, throws doubt on the validity of one of their favorite laws of history. Mr. Morley (of whose vigorous and honest criticism no candid reader can speak without deep respect) is perfectly right in the assertion that Mr. Mill's language with regard to Christ is inconsistent with the doctrine that even the greatest men are simply the expressions of their age. Mr. Mill obviously saw the difficulty over which his follower stumbles, and would, it may be presumed, have replied to Mr. Morley's attack, that if the laws of history did not conform to known historical facts, this might be a reason for correcting our notions of historic method, but was not a ground for shutting our eyes to the result of satisfactory investigation. Mr. Mill, in fact, throughout the whole of his writings, occupies substantially the same position. He gives the greatest scope to the imagination. On the other hand, he systematically attempts to regulate his belief in accordance with the conclusions of the intellect. In his own case, his character and training made it possible to preserve the nice balance between sentiment and reason, and his own exceptional experience led him into what must fairly be termed the delusion that the mass of mankind could safely cherish hopes for which there is (on Mr. Mill's theories) no rational foundation. This illusion gives an appearance of moral casuistry to one portion of his last work, but attentive readers easily perceive that Mr. Mill's advice to cherish hope, though it may lead to intellectual dishonesty in others, is given by him in perfect good faith. What will be the permanent effect of his religious speculations neither assailants nor admirers can at the present moment predict. It is possible that he may induce some few of his sceptical disciples to reconsider the value of their formulas. But the main effect of his work will lie not so much in its direct teaching as in its indirect influence. It may be inadequate. As a theological treatise it will always be the weighty and impressive confession of an enquiring spirit, written by a man who has the intellectual clearness and moral honesty to state boldly what he does and does not believe, without concealing either the extent or the limits of his creed.

---

*Young Folks' History of the United States.* By Thomas Wentworth Higginson. (Boston : Lee & Shepard. 1 vol. 12mo. Illustrated).—Colonel Higginson's book is quite a model of its kind—compact, clear, and accurate. Even in our short-lived annals there are myths which, having done duty as history for past generations, are now made over to confiding young people as facts. Colonel Higginson relates none of these, unless we except the apparition of Goffe the regicide when the Indians attacked Hadley. This story has recently been challenged, and apparently shown to be without any better foundation than tradition. It belongs probably to a very old class of myth. Castor and Pollux were seen at the battle of Lake Regillus ; a pair of saints fought in the air for Constantine against Maxentius at the Milvian Bridge ; and the army of Cortes was saved in Mexico by San Iago in person. It is only remarkable as having originated so recently and in New England. Many of our books for children are disfigured by Americanisms and colloquial vulgarisms, and some writers for the young adopt the sort of patronizing, jocular tone which visitors of ragged-schools are apt to assume when addressing the pupils of these institutions. It is kindly meant, no doubt, but instinctively irritating to any boy not descended from a long and unbroken line of paupers. This history is free from such blemishes. Its tone is always quiet and gentlemanlike, without exaggeration or conceits of language. There are no symptoms of rampant patriotism or spread-eagleism ; even manifest destiny has been omitted. It is especially grateful not to be told that America is the home of the oppressed of all nations, and the only hope of liberty and civilization.

Unless we are mistaken, children of a larger growth will find this little book a most useful manual of American history. Nowhere can they get the facts so well stated in so small compass. The first three chapters treat of the "pleistocene" aborigines, the mound-builders, and the Indians ; the next three relate the apocryphal story of the Norse colony, the voyages of Columbus and of his successors. These are followed by an account of the settlement of the thirteen colonies, which gives a clear and comprehensive view of the subject, and by capital sketches of colonial life and customs in New England, among the Dutch in New York, and the Friends in Pennsylvania. The narrative of the French and Indian wars, from 1689 to 1763, closes the history of the ante-revolutionary period, all of which is comprised in 158 12mo pages ; but Colonel Higginson has selected his incidents with so much judgment and arranged them so skilfully, that a careful perusal of this half of his book will give the ordinary reader all that he would probably take away, or care to remember, if he had the time and courage to master the eight volumes of Bancroft on the same subject. In the remainder of the volume the history of the country is brought down to the election of Grant. In our own times and in the war of secession, the author is as impartial as in his earlier chapters. There is no trace of party feeling or prejudice.

We will notice one passage only, because it seems to give President Jefferson praise to which he is not entitled, and in our opinion Jefferson has been too long worshipped by a party for attributes he did not possess. On page 237, speaking of the quarrel with the Barbary States, Colonel Higginson says : "President Jefferson resolved to bear this humiliation no longer. The American navy consisted at that time of but six vessels, and he sent four of them to the Mediterranean," etc. Many thousands of dollars had been paid for peace to the Barbary powers, and many insults meekly submitted to by the Government of the United States, when, in the year 1800, the United States ship *Washington*, Captain Bainbridge, lay in the port of Algiers about to sail for home. Suddenly the Dey ordered the United States consul to send her to Constantinople with the Algerian ambassador to the Sultan on board, or he would declare war against the United States. The consul protested but submitted, and the ambassador with his suite amounting to two hundred persons, their luggage, stores, and horses, and their presents of wild animals to the Sultan, were shipped on board the *Washington*, and she sailed for Constantinople carrying the Algerian flag at the main. When the news reached America Jefferson was President. He was not roused, but "hoped that time and a more correct estimate of interest would produce justice in the Dey's mind." He contented himself by sending a protest to the consul in Algiers. It was not until the Pacha of Tripoli declared war against the United States that anything was done for defence. Even then, if Jefferson could have had his way, not a ship would have sailed from these shores. But the merchants insisted upon protection in the Mediterranean, and with great reluctance he sent out three frigates and a sloop under Commodore Dale. But Dale's hands were tied by his orders, and he was instructed not to overstep the

strict line of defence. Dale returned home after taking one Tripolitan schooner, which he disarmed and returned to her crew. The year after, Commodore Morris came to the Mediterranean and did nothing at all. The next year, 1803–4, Preble was in command, a man who would not be prevented by instructions from doing his duty. When the news of the burning of the *Philadelphia* reached home, the blood of the nation was up, and the administration had to yield to the popular feeling; but the credit is due to Preble, not to the President, who never contemplated or desired any such violent proceedings.

There are good monographs on particular periods of American history, but neither Graham, Hildreth, nor Bancroft is entirely satisfactory. This unpretending little book is the best general history of the United States we have seen. It contains all of it that the average citizen requires in order to go through life comfortably and creditably. With this well-drawn outline fixed in his mind he will always know where to place any additional facts that may be brought to his notice; and we hope that Colonel Higginson's readers, both young and old, will take pains to imitate his simple, straightforward style, which is not the least attractive feature in the work.

# Fine Arts.

A NEW French periodical, *L'Art*, edited by M. Eugène Véron, and issuing from No. 3 Chaussée d'Antin, Paris, is represented by an address in almost every capital of the globe, among others that of F. W. Christern in this city. It is in ample folio form, the page giving room for very large etchings when necessary. Of the two which accompany the first number, one is rather rococo, being a beribboned, fluttering, voluptuous group after Boucher, called the "Happy Mother," and the other daintily Dutch, being a household scene after De Hooghe. The latter, etched by Rajon, is the better specimen of aqua-fortis work, though both are good interpretations in their styles. There are woodcuts in all profusion, those illustrating Pompeii art being not very novel and not very well printed. The text is of good artistic tone and agreeable, and includes music among its subjects.

—The representatives of Goupil in New York have made an exhibition in which, abandoning all concealment, they lay bare to the public gaze whatever they have of water-color art. Little sketches by Greuze and Joseph Vernet, snuff-box-lid painting by German miniaturists, the stippled rustics of English pastoral art, are brought into juxtaposition with the most brilliant examples of the Roman and Parisian schools. No part of the display is more interesting—though there is a Meissonier, and a radiant little landscape by Français—than the works of that small, audacious, and dazzling group, which, starting from the example of Fortuny and Villegas, have disported with so much effect as the Roman-Spanish colorists. Several of these painters, seizing with avidity upon aquarelle as the readiest means of expressing their peculiar researches, have brought up to water-color art the training and resources acquired in works of a larger scale, and touch the cartoon with all the ease of careless mastery. The specimen in the Goupil collection of Fortuny, though small and representing but a single figure, is a lesson in its technical specialty; the face, modelled in single plans and without correction, and the deep tint of the robe—it is an Arab in a mosque—are laid upon the sheet in direct breadths and touches, the purity of color being never endangered by going over and over; and the vigorous relief and roundness of the resulting figure, with its sombre splendor of tint, are triumphant. The others of the Roman-Spanish group—comrades or imitators of Fortuny and Regnault, and generally established in studios at Rome, are represented in a cluster, and include such names as Detti, Peralta, Filosa, Rossi, Ettore and Attilio Simonetti, and Ximenes—or, as usually written in modern spelling, Jimenez. The large Simonetti, representing an intrigue between a languid beauty and an *incroyable* during the somnolence of the husband, is a marvel of lustre and flash, entirely appropriate to the butterfly life depicted; quite in contrast, and recognizing an older system of instruction, is the school-scene with a culprit pupil, by Bianchi of Milan, in which the broad and delicate tones have more the effect of fresco. In fastidious contrast, again, is the work of Edouard Frère, who never took kindly to aquarelle, and who hardly permits the most reserved wash of color to blur the lines of his tender cottage group. The contrasting texts furnished by so complete and representative an exposition as this are almost puzzling to the tyro in water-color, while the advanced connoisseurs have wherewithal to sustain prolonged controversies according to their several tastes. The collection occupies the Kurtz gallery, and is arranged preparatory to a sale which will begin on the 15th.

—That Turner's pictures should come to be copied with sympathy and affection by French etchers would have seemed a thing almost impossible in his lifetime, considering the hostile distance then maintained between the artists of the two countries; yet in the English *Portfolio* for the past year there are several very beautiful copies of the sort, such as the "Téméraire" and "Wilkie's Burial"; and the motive cause of this good result, it is not too much to say, is primarily the existence in life of Mr. Hamerton, the editor of the periodical in question. The peculiar international education of this gentleman has really been of incalculable advantage to several of the arts, and has especially subserved the abatement of prejudice on the two sides of the Channel. The *Portfolio*, under his care, has been a very admirable master of ceremonies between the countries, and has harmonized the results of British and Gallic art in one chronicle of representative works. During the year covered by the volume that is now just bound, not only have prominent engravers of both races been introduced laboring side by side in all harmony; but the editor has rather slily inserted a choice lot of French scraps as arbitrary illustrations to his own serial of "The Sylvan Year." This is a narrative that almost any possible print would go with, being the dreamy record of idle months spent in lolling under trees or hanging over streams with books of poetry in hand; it is the reverie of an obstinate landscapist, and the impartial reader will be amused to see how triumphantly Mr. Hamerton drags in the Greek and Latin poets, who wrote before landscapes were felt or examined, in the character of singers of scenery, for all the world as if they looked at nature like Rossetti or Tennyson. "The Sylvan Year" closes with the volume. The monthly number for January introduces, along with etchings of the usual high quality, a photogravure after one of Jules Breton's paintings. The picture, a lovely group of peasant girls at a spring, is copied touch for touch, and is even happy in tone; it is probable, however, that the most valuable extremes both of light and shade are omitted, for the print has a non-committal, regular, cautious, safe style, like a timid mezzotint, and shows somewhat poorly beside the dazzling black and cream of the best etchings in the collection. It is to be acknowledged, however, that the method is the only one that can copy with precision the expression of a face, or other such close indication of the very soul with which the artist is creating his subject. Of the *Portfolio* altogether it is to be said that not only is it the first periodical in the English language devoted to fine-art, but that it leads all others by a very great distance, whatever the second and third of such publications may be taken to be. What with the erudite catalogue-making of Mr. Wornum, who annotates the series of etchings after the National Gallery pictures, the clear and attractive contributions of Mr. Hamerton, and the writings of other critics, a journal is made up which, if it be not quite so technically strong as

the *Gazette des Beaux-Arts*, is decidedly less Chinese and coast-bound in policy than that blindly national publication. The *Portfolio*, since the beginning of the year, has an American imprimatur in addition to its old one, being published in this country by Mr. J. W. Bouton. The number for January closes with some technical notes on painting methods, by Mr. Calderon; this feature is intended to be continued as a series of monographs, and will be especially valuable if the invitation to contribute is extended to Continental artists.

The attention of all readers of books of travel is invited to

*AFRICA:*

The History of Exploration and Adventure, as given in the Leading Authorities from Herodotus to Livingstone. By C. H. Jones. With Map and numerous Illustrations. 8vo, $5.

"This has been compiled from the whole range of African literature, Livingstone's last journals included. . . . Each of the leading explorers has a chapter, and Livingstone four. Barth, Overwung and Richardson, Anderson, Du Chaillu, Burton and Speke, Grant, Baker, Stanley, Schweinfurth, and Bartle Frere, are among the explorers whose books are summarized at length, and there is also a valuable chapter on Christian Missions in Africa."—*New York Tribune.*

# The Nation.

*NEW YORK, THURSDAY, FEBRUARY 18, 1875.*

## The Week.

THE single bill of importance, except the Indian Appropriation Bill, which has passed the House during the past few days, is a measure for the equalization of bounties, which would increase the debt by $100,000,000 or so; but it was passed for buncombe, and it is said cannot get through the Senate. Several bills have received a quietus, among others the "Choctaw Claim," which would have taken $3,500,000 out of the Treasury, though it appears from the debate that this money is detained in the Treasury somewhat in the way that the *Alabama* fund was invested in United States bonds, rather in the interest of economy than of justice or morality. The arguments principally used against it were that the Choctaws had enough provisions already, and that the money would chiefly go into the hands of speculators. In the Senate, on Wednesday, the Steamboat Bill, which is said to have been in Congress for four years, was recommitted to the Committee on Commerce, and the Senate also discussed Mr. Morton's amendment to the District of Columbia Bill, making the government elective instead of appointed. On the same day, in the House, Mr. Dawes, from the Committee of Ways and Means, reported the new Tax and Tariff Bill, taxing, first, distilled spirits one dollar a gallon, with an additional tax of fifteen cents over and above the present tax of seventy cents on all spirits now on hand; second, imported liquors $2 50 a gallon; also, increasing the tax on tobacco from twenty to twenty-four cents, and, further, repealing the ten per cent. "horizontal reduction" of a few years ago on manufactured goods; and, finally, abolishing the tax on lucifer matches. The bill was referred to the Committee of the Whole, and made the special order for the next day. The House also finally killed, by an almost unanimous vote, the Pacific Mail contract and subsidy of 1872. On Thursday, the Senate rejected Mr. Morton's amendment to the District of Columbia Bill by a vote of 28 to 28. The House then went into committee of the whole on the Tax and Tariff Bill, Mr. Dawes making a speech in its favor, and Mr. Wood against it. On Friday, the Senate made short work of the Portland, Dalles, and Salt-Lake Railroad and Telegraph subsidy, Mr. Frelinghuysen first explaining that the Committee on Railroads, which had six or seven subsidy bills before them, had determined not to report any of them. The bill was voted down by yeas, 21, nays, 46.

On the same day the Republican House caucus, very thinly attended, adopted substantially the bill for the government of the South reported by the joint caucus committee. The debates of the caucus showed that the more prudent Republicans are beginning to get alarmed at the direction things are taking. Mr. Garfield and Mr. Blaine are both opposed to the bill, the former having remarked that, if it means anything, it means "third term." The bill as agreed upon revives the power of the President to suspend habeas corpus whenever he is convinced that there is a rebellion going on in any State. On the question of the suspension of habeas corpus, we quote the very significant language of Mr. Blaine, as given by a party organ in Washington:

"He could not see why Southern States like Virginia, North Carolina, and Tennessee, that were now trying to sustain good governments, should be menaced and excited by a suspension of habeas corpus. Moreover, the pending proposition was unlimited as to territory and unlimited as to time. The bill, if it should become a law, would confer upon the President of the United States for all time to come, whoever that President might be, the right and power to suspend the habeas corpus at his sole and absolute discretion in any city, county, district, or State within the Union."

On Saturday, in the Senate, the District of Columbia Bill was discussed and amended, and in the House the Equalization Bounty Bill was passed. On Monday, nothing of importance was done in either House, except that the Senate made a beginning of Mr. Pinchback's case.

The details of the Southern bill are as monstrous as its general spirit. The first section makes it a felony for two or more persons to "interfere," even, in an "unlawful manner" with the "due execution of the laws of a State or of the United States"—a clause which would make all the railroad officials who resist what they believe to be the unconstitutional laws of Wisconsin or any other State liable to be thrown into jail for ten years and fined ten thousand dollars apiece; the second section, however, is more lenient, for it makes the punishment in case these two or more persons actually conspire to overthrow a State government, or do "actually overthrow" it, only $5,000 and two years in jail; while apparently all these things, if done by a single person, would not be a crime at all. The third section provides that no United States voter who can now vote shall ever be deprived of the right by any State; the fourth makes it presumptive evidence of an attempt to "intimidate" if any one is found with firearms on election day or registration day, and makes intimidation of State voters a crime against the United States. The fifth and sixth and other sections put the State elections generally under the control of the United States officials, while the seventh section provides that it shall be murder to kill anybody who is carrying out the provisions of this law.

The financial debates of the last week or two have been in many ways singular. In June of last year Mr. Dawes, as chairman of the Committee of Ways and Means, made a speech on the estimates, in which he said that our receipts for the preceding fiscal year overran our expenses by $5,000,000, that our expenses had for the coming (the present) year been cut down by $26,000,000, and that therefore, supposing our receipts were no better this year than they were last, we should still not only make ends meet, but have a surplus. In other words, our receipts would have to fall off this year by over $31,000,000 to make a deficit. It is now said that receipts for the seven months of the current fiscal year which have already elapsed have fallen below those of last year by $3,379,000; but even if this rate of diminution is maintained to the end, which is unlikely, we shall still have a surplus, supposing the expenses have not increased, and the revenue is almost certain to be as good as ever during the year beginning June next. To what extent the expenses have increased we do not know, but either they have increased enormously or the increase of taxation now proposed of $40,000,000 is totally unnecessary. The talk about the Sinking Fund is only darkening counsel, because the Sinking Fund obligations, whatever they are, were in existence last year when Mr. Dawes made his speech.

The fact is, however, that there is no such thing as a "Sinking Fund" in existence, and there never has been. The origin of the belief in it is this: The provision of the Loan Act of February, 1862, section 5, looking to the establishment of such a fund lay dormant until the Secretary of the Treasury in 1869 began to buy bonds, a portion of which, as appears by his report to Congress in December of that year, he designated as Sinking Fund Bonds. Congress then, in pursuance of recommendations in the same report, passed the Act of July 14, 1870, to authorize the refunding of the public debt, but added thereto, in the 6th section, provisions of the highest importance, both to the country and its creditors. By those provisions, all bonds that had been or should be applied to that fund, and all other bonds redeemed or purchased by the United States, were required to be "cancelled and destroyed," and the amount of them to be deducted from the outstanding public debt. By force of the two Acts, then, the Government has

entered into an engagement with its creditors—not that it will maintain a sinking fund to accumulate for the future payment of its debt—but, what is a great deal better, that it will absolutely pay and extinguish, once for all, an amount of its debt equal to one per cent. for each year. This engagement to its creditors the Government has fully kept and performed, and there does not seem to be any present necessity to add taxation on that account.

We have not at this writing got the report of the second committee which went down to Louisiana to investigate the state of things there, but Mr. Frye, one of its members, has been talking freely as to the results of their researches, and gives a very bad account of the state of things there—substantially the same, however, as that reported by the sub-committee. Business is prostrate, the laws silent, the people unhappy and hopeless. He thinks there has been great intimidation of voters, but not on election-day—the intimidators, according to him, taking great pains to suspend their labors on the day of voting. The Returning Board was not, he thinks, guilty of any fraud, but the Conservatives had a legal majority in the House, and were therefore entitled to the Speakership. On this point, however, Mr. Frye must excuse us if we wait until we hear from General De Trobriand, as it was he and fifteen soldiers who passed on the qualifications of the members. The troubles in New Orleans Mr. Frye ascribes not to the real Conservatives, who are very respectable men, nor yet to the Radicals, who are *ex officio* respectable, but to a body of young men called "the wicked element," who have attained their majority since the war, and have no regular occupation, and whose feet are now swift to do evil. It appears also that General Sheridan is insulted by anonymous letters, by hissing in the street, and by talk directed at him at the hotel table. If this be a true account of the state of things in the city—if it contains a "wicked element," and General Sheridan is hissed in the streets, and talked at at the *table d'hôte*, we ask no more. Bring up the guns, away with the Constitution, suspend the habeas corpus.

The Burlington (Vt.) *Free Press*, Mr. Trenor W. Park's home organ, has published a letter about the Emma Mine signed "P," which appears to be written by the only "P." in the United States capable of asserting that "all who are acquainted with the history of the transaction [the sale of the mine] know how groundless the charge [of fraud] is." We need hardly say we mean the eminent Park himself. The sale has been pronounced fraudulent already in the English courts, and we venture to say that not one of the principals would venture to show his face in England at this moment. "P.'s" version of the transaction, as he relates it in the *Free Press*, is, as his readers will find out before long, an amusing and impudent fiction, which he has already published several times. He flatters himself that the suit brought against him and his confederates by the English stockholders is "a sham, never intended to be brought to trial." This is what he would doubtless like it to be; few of his kind really believe that they will be brought into court—if they did they would behave better; but he never was more mistaken. He also says that there are two actions for libel pending arising out of the affair, one brought by Professor Silliman, and the other by Mr. Silas Williams, Park's manager at the mine, against the *Nation*. In this "P." is again in error. Professor Silliman threatened us with an action, and we invited him to bring one, as did the Springfield *Republican*, but he did not do so. Mr. J. D. Whitney, the geologist, then brought him before the National Academy of Science, on this and other charges affecting his professional conduct, but that body has, we regret to say, declined to investigate the matter, as beyond its competence. His share in the Emma Mine affair, however, will of course now be investigated in the pending suit. Mr. Silas Williams has brought a suit against us—as we believe, instigated by Park, who hoped doubtless that the whole affair might thus go off on a side issue, and that he himself might escape under cover of Williams's dust. But we now assure our readers that, though Williams's case will be tried, Park will not escape; that he and his confederates, Stewart and Baxter, will really be brought to book; that the evidence against them is, we believe, conclusive, and that the overhauling they will get will be a great thing both for the politics of the country and its commercial honor.

We ought to add here that the public must not be deceived in this Emma Mine matter by the notion, which forms the main point in Park's newspaper defences, that the vendees in London were a different party from the vendors, and that therefore, if the latter were satisfied (and it was they who employed Professor Silliman), there was no fraud in the sale. The fact is that the vendors and vendees were to all intents and purposes confederates, and where the fraud began was really in the sale of the shares to the general public. Park and Stewart got up the company, of which they were part, in order to sell the mine to it, and then the company cheated the public. General Schenck, for instance, was one of the vendees, but nobody supposes he was a good man to sell a mine to. He was engaged by the vendors to be a vendee in order to secure the use of his name in aid of the sale of the shares. What stock he held he had either to borrow the money for from the vendors, or had it allotted to him by them as a reward for his services. The affair was managed by Albert Grant in the usual manner of "bubble companies," and he received, we believe, $500,000 for carrying it through.

The meeting of the Liberal members of the House of Commons to elect a "leader," which our correspondent discusses in another column, has excited a good deal of sensation in England, and forms the subject of one of Mr. Bagehot's lucid articles in the last number of the *Economist*, as the first open departure from a constitutional usage established ever since 1688, but which, as Mr. Bagehot points out, has really been extinct for some time, though its extinction has never been recognized in practice until now. That is to say, the usage has been, ever since the revolution of that year, for the King to select the person who should form the Cabinet and appear for the Government in the House of Commons, and the person so selected accepted the place at first in any case, but more recently only in case he thought he could command the majority of the Lower House. In short, the King designated the leader of the House, and the majority accepted him. As time wore on, the House threw up into prominence three or four persons, among whom the King found himself obliged by circumstances to make his selection, but still the selection was his. More recently, the House really presented the only person whom he could select, but the choice continued to be his *in appearance*. Now, however, for the first time, even the appearance of deference to the royal authority is thrown off, and the party meets out of doors and chooses the man who must be Prime Minister if it comes into power, leaving the Queen no choice in the matter. In other words, the Premier is selected by a party caucus.

The progress which the French Assembly seemed to be making towards the adoption of a constitution was rudely interrupted on Thursday of last week by the adoption of an amendment to the Senate bill which made the members of that body elective by universal suffrage in the same manner as the other House, thus making it impossible to give it a different character or composition, except by exacting qualifications for eligibility to it. This was accomplished by the support of the Bonapartists, and the minute it took place the Right broke up its alliance with the Left, and when the bill came up for a third reading it was rejected by 357 to 345—a result which was hastened by an announcement that if the bill were passed in that shape the Ministry would resign. The situation, however, as the defeat of the bill left it, was by no means reassuring, as the defeat seemed to put a stop for the present, if not for good, to all attempts at constitution-making on the part of the present Assembly. The excitement was accordingly very great, and in the midst of it M. Busson, of the Left, moved for a dissolution and the election of a new Assembly in April, but was badly defeated, and M. Wadington of the Left Centre came to the rescue with another bill making the Councils-General, the Colonies, and the In-

stitutes the constituency of the Senate. This was referred to the Committee of Thirty. Sunday seems to have been given up to rumors, one of which was that the Ministry had resigned, but the probabilities are that they will stick to their agreement to stay in office until the Assembly either drafts a constitution or definitively fails to do so. It is safe to say that no Second Chamber elected by universal suffrage will ever be accepted by MacMahon, and there is no reason why it should, for such a body would be a useless appendage to the government. A Senate elected by a selected constituency would, doubtless, not be as strong as the Assembly, but it would be as strong as the constitution, and would at all events introduce a steadier and more intelligent element into the administration and legislation than the Assembly could supply. Of course no such body would have great weight until it had lived long, but this is true of any institution that can be set up in France, and the problem of French politics just now seems to be to set up anything that *will* live.

---

The situation is, however, very critical. The debates have been marked by extraordinary violence, and a duel arising out of one of them involving so considerable a person as the Duke Decazes was at one time impending. The Duc de Broglie, it may be remembered, refused to take office until the constitutional bills were disposed of, being unwilling to face this ordeal, and was by implication supposed to be ready to do so when this was over. Unluckily, however, he took part in the discussion, and was so badly beaten on one of his motions that he is considered *hors de combat* as regards the formation of a new ministry—a fact which makes the present crisis somewhat more serious, for there does not seem to be anybody else for Marshal MacMahon to turn to. The position of parties may be summed up by saying that just as each is willing to have the present Assembly exercise constitutional powers, if it will only exercise them in what each considers the right way, so each party is willing to abide by the principles of the Ventavon bill if they are applied in what it considers the right way. For instance, both Right and Left agree that the present Assembly should provide for the "transmission" of the President's powers, but disagree about the method. Both think there ought to be a Senate, but disagree as to its composition and the manner of its election. Each is willing that the Senate should, with the President, have the power of dissolving the lower house, if it can have the kind of Senate it wants. The Bonapartists in the meantime act in all this turmoil the part of the mocking fiend. Their policy is to use their forces in such a way as to prevent any final arrangement, because they believe, and rightly, that the prolongation of confusion tells in their favor, and so, they think, does what has recently happened in Spain. Isabella has written to Eugénie, hoping that the piece of good fortune which has befallen Spain is soon to befall France. The revenue, in the meantime, is feeling the effects of the uncertainty, and the financial outlook for the ensuing year is "blue."

---

The German Parliament has carried through one other piece of legislation which forms a most important step in that secularization of the Empire of which the war against the Catholic Church is really only a part. Hitherto the laws relating to marriage have, of course, been different in every state, little and big. The new law enables people to have their children baptized or not as they please, and to be married without the aid of a minister of any denomination and before a civil registrar, if they prefer it, or, in other words, assimilates the law of marriage to that of France, against which the church at first kicked vigorously, but to which it now quietly submits—the priest making no objection to giving the nuptial benediction to couples who have been already legally married before the maire. In Germany, now, a woman must have the consent of her father if she marries before twenty-four, a man if he marries before twenty-five; but, the "Suffragists" will be shocked to hear, the mother's consent is not required unless the father is dead. Should he refuse his consent, the candidate for matrimony may get a dispensation from the courts. A person divorced for adultery cannot marry his or her paramour, and widows cannot remarry for ten months after the death of the husband. Any clergyman who marries a couple without the previous performance of the civil registration can be fined $75 or sent to jail for three months. All jurisdiction of marriage and divorce is taken away from the clergy, and priests, monks, and nuns may legally marry if they please. A similar act was passed for Prussia some time ago, and since it has been in operation only 25 per cent. of the marriages in Berlin have been celebrated in churches and only 30 per cent. of the children born have been baptized by clergymen—a striking illustration of the smallness of the aid which the state can render the church in retaining its hold on the popular conscience.

---

The Landsturm Bill lately passed places every man in the country between the ages of 17 and 42 in the army; and whenever the Government "thinks an enemy is invading or threatening to invade the country," the whole force may be called out for active service, and the act may be enforced in any one province of the empire the Government may select, and not in the others. This will raise the German army, should only the first ban of the Landsturm be called out, to 1,750,000 men and 45,718 officers. Should the whole of the Landsturm be called out, the total will be 2,800,000. Under the existing French law, when working up to the maximum, the total French force will be 1,698,000 men and 36,000 officers. The Russian force, under the new military law, reaches, or will reach in ten years, 3,376,000 men and about 100,000 officers. The small powers are fast following in the same path, with ruinous influence on their finances, though doubtless with—particularly in Italy—excellent effect on the morale of the population. But what a difference in some important respects there is at present between the armies may be guessed from the fact that Germany has only 4 per cent. of illiterates among her rank and file; while France has 23, Austria 54, and Russia 87.

---

The Montenegrin quarrel with Turkey, arising out of an affray at a fair at a town in Turkish Albania, called Podgoritza, in which several Montenegrins were killed, has just been settled, but, like the dispute in 1852 about the Holy Sepulchre, it shows on what slight matters the peace of Europe in the East may be said to depend. Turkey tried and convicted her own murderers, but as some Turks were killed too, she demanded that the Montenegrins who killed them should be surrendered for trial before her tribunals also. This the Montenegrins considered a mere pretext to avoid any satisfaction whatever, and there was for a long time danger of a popular rising in Montenegro for a raid over the frontier, in spite of the efforts of the Prince to keep the peace, and of the German and Russian Ambassadors to make Turkey yield. The outbreak would have imposed on Austria the almost impossible duty of preserving her neutrality on the mountainous frontier of Dalmatia, and would have tempted Russia into supporting her co-religionists, and so on. Luckily, however, both Austria, Russia, and Germany found it possible to act together, but the danger is not over. The inhabitants on both sides of the Turkish frontier are fiercely hostile, as they have been for ages. Collisions are constantly impending, and the Montenegrin population is increasing in their little nook of barren mountains, and the temptation to push over the line therefore increasing also. Moreover, the thing which the Montenegrins most desire is a seaport, which, though they are in sight of the sea, they do not possess; and yet on the little slip of territory which cuts them off from the water, and which naturally belongs to them, Turkey has three harbors which she never uses and cannot use, and which the Montenegrins long for, and the sight of which infuriates them. The recent dispute was settled by Turkey agreeing to have the Montenegrins tried in Montenegro for offences committed on Turkish soil, and to send the Turkish witnesses over the border—a concession to Montenegrin subjects of the ex-territoriality enjoyed by those of other Christian powers which is, all things considered, no slight concession.

## THE DESPERADOES AND THE HABEAS CORPUS.

WHEN the first Ku-Klux Act was passed in 1871, daring as were its violations not only of the Constitution but of all sound and valuable political usage, the country bore with it, owing to the facts that the outrages committed in South Carolina seemed to call for violent measures, and that the Act was to expire in a year. We pointed out at the time the ingenious fraud by which it evaded the plain prohibition of the Constitution that the "habeas corpus shall not be suspended except when in cases of rebellion or invasion the public safety may seem to require it." The way the majority got over this, and provided that the habeas corpus should be suspended in time of peace, was fully as dishonest as many of the acts for which men are sent to the penitentiary. It consisted in giving a new and previously unheard-of meaning to the words "rebellion and invasion"; that is to say, the Act declared that the term "rebellion" should, on this occasion, no longer signify what it had always signified, both in the nomenclature of jurisprudence and in popular usage—an actual war carried on by organized bodies of men against the Government—but a concourse of "insurrections, domestic violence, combinations, and conspiracies" (terms defined by the Act itself), either carried on against the State authorities, or by them. In short, the majority in Congress, by an unwarrantable perversion of the language, invented a new offence, unknown to the Constitution, and declared that whenever the President saw or thought he saw this he might suspend the writ. The Constitution and the law, as they had previously stood, allowed him no such discretion. They only authorized him to call out the militia and proclaim martial law when certain well-known and easily recognized phenomena, which stopped the ordinary social machinery, presented themselves. That is to say, they left him no more discretion than they would have left him had they said that the habeas corpus could only be suspended during a famine or after a destructive earthquake. What Congress did was to step in and declare that, if pie was scarce, it should be held that there was a famine, or that, if strange noises were heard in the night-time, it should be deemed to all intents and purposes that an earthquake was raging.

It was originally intended by the Desperadoes of the party in 1871 to bestow this tremendous and fraudulent discretion on the President not for one year only, but for two, or, in other words, until after the Presidential election, so that he might have the power, during his own canvass, to place half the country under martial law on any pretext which he chose to consider sufficient. This monstrous proposal was only defeated in the Senate by the strenuous exertions of Mr. Schurz and a few others of the saner members of the party. The plan has, however, evidently lingered in the minds of the originators as something it was desirable to bring up again if possible, and they accordingly brought up and carried in the Republican caucus in Washington, the other day, the draught of a bill giving the President this extraordinary power for an indefinite period. The project was of course resisted and denounced by Mr. Blaine and such other Northern members as have not lost their heads, and still retain some susceptibility to the working of public opinion at home, and we have no fear that it will be possible to embody it in legislation. But that it should have been seriously proposed as a party measure, by a majority of the Republican members, to bestow the power of arbitrary imprisonment on an elective officer during a period when he will or may himself be a candidate for re-election, not in time of war, but in time of peace, and for the ordinary purposes of internal police, and in direct defiance of the Constitution, is perhaps as striking an illustration as any one could wish for of the sort of mental and moral derangement into which the prolonged absorption in wild and impracticable schemes is apt to throw people. That the Republican party should pass out of power while pushing a bill differing little from the French Law of Public Safety, and really converting the President into a sort of tawdry Cæsar, is perhaps as unusual an incident as could be found in political history, and yet it is a by no means unnatural result of the confusion of judgment into which it allowed itself to be irritated after Mr. Lincoln's death by Southern recalcitrancy. The first plan for protecting the negro, the bestowal of the suffrage, may not have been wise, and was sure, like any scheme, to be only partially effective; but it was not unreasonable or illogical. It was doing for the negro the best thing, and indeed one might say the only thing, within reach of the party which emancipated him; and if the attempts for his relief had stopped there, there would be little to be now said. But the not by any means extraordinary and somewhat obstreperous resistance of the whites to having their old slaves made equal to them, and in some cases put over them, at one stroke, completely threw the Republican majority off their balance, and seems indeed to have plunged them in temporary madness. The more the South kicked, the more the Republican party determined to do by legislation for the negro, until it soon found itself directing the President to work miracles for him with the aid of the army and navy. It was not enough to give the colored man the ballot and full standing in the courts—the party was soon goaded into trying to make Southern whites look upon him as a superior being, and treat him with a respect and consideration and forbearance which they have never shown even to men of their own race. Attempts were made to achieve for him by bill and resolution, and committees of investigation, in a wild and half-civilized social state, what legislation has never done for white men in any state—that is, to save him from the ordinary results of weakness and poverty and ignorance, and enable him to govern people stronger, wilier, richer, more astute than himself. Whites, in his condition, are always more or less "intimidated" and oppressed and "ostracised," even in the most highly civilized and best governed countries. They could not escape it except by a change in human nature; and the most that rational legislators usually attempt by way of remedy is to encourage religious and moral influences, and provide upright administration of justice, and then wait patiently for the Kingdom of Heaven. But neither experience nor common sense made any impression on the men who are now winding up their political career in Washington. They seemed to suppose that as the black man had been so badly oppressed, and was ready to vote the Republican ticket, Providence would somehow interfere directly on his behalf.

The truth is that, what with the irritation caused by the white resistance, and the humanitarian enthusiasm excited by the war, the Republican party has been undertaking tasks by which, among a rational people, any party was sure to be ruined before long. The schemes of the more advanced members of it have all along had a flavor of Jacobin indifference to time and place and circumstances. Many of the provisions of the Enforcement Acts are as comic as the famous proposal to expel all the rascals from France. The utmost that was possible to accomplish by legislation after the war, was to make the colored people as comfortable as the condition of a barbarous and impoverished society, in which they formed the lowest stratum, would permit, and trust to the great but slow working forces of civilization for the rest. But our Washington statesmen would not be content with anything short of the immediate regeneration of Southern society in time for the celebration of 1876. They would not even be content with the cessation of acts of violence. They insisted on all Southern whites providing themselves at once with a new social ideal like that of Massachusetts. They wanted to have all Southern villages at once modelled on Concord or Natick. Men who had four years before considered the negro a beast of burden, were expected suddenly to treat him as a friend and fellow-citizen. Men who were bred in no more respect for free discussion than a Montenegrin, were suddenly to display as great a faith in "the interchange of views" as Henry Wilson or Horace Greeley. A society in which physical courage held the highest place among the virtues, and private war had for two hundred years been an honored custom, was to become in a year as peaceable and long-suffering and tolerant as a Methodist conference. A society whose politics had during all that period been regulated by "intimidation," and based on "intimidation," was expected to treat intimidation as a disgraceful offence on hearing that Northern moralists thought ill of it. At this moment there are plenty of half-cracked zealots

in Congress, not without influence either, who will declare that they are ready to suspend the Constitution, or overturn it, until such time as an orator can abuse the South as freely in New Orleans as he can in Boston. There is no answer to be made to such people. There is only one way of dealing with them, and happily that is likely to prove effective, viz., to ask the American people to send them home and commit the Government to those who have some faith in the progressive instincts of human nature and in American political principles. The Southern problem is not one to be solved by Jacobin commissaries, with "troops" at their heels. "The army and navy" have not made the North what it is, and they cannot make the South what it ought to be. Great and free and flourishing societies are not called into existence by sounding a cavalry trumpet, and the poison of two hundred years of slavery cannot be extracted from any body politic by the sword. There is no medicine for this but time and patience, and the growth of wealth and population; the sense of mutual dependence, and the kindliness which this sense generates; and the removal as far as may be of all reminders of the tremendous conflict in which slavery perished. The Southern negro cannot in one Presidential term, or in one generation, be converted into a person whom Anglo-Saxons like to have govern them; and the Southern white cannot in one generation be made to feel that it was a great mistake that he did not let the negro govern him sooner. If it had been easy for men of his race to take this view of the black man, doubtless the lot of the latter would have been much happier; but doubtless, too, the American Union would never have existed to shelter him, for nothing is more certain than that the Southern stiff-neckedness which is now troubling us so much has its root in the noble temper which gave us Hampden, and Cromwell, and Washington.

## MR. GLADSTONE'S RETIREMENT.

IT would be difficult for a politician in any country to secure a more gratifying triumph than Mr. Gladstone has had in the effect produced by the news of his retirement from the leadership of the Liberal party in England. It has been treated on all sides as a political event of great moment, and rightly so, for his resigning of the leadership evidently means that his political life is practically at an end. There has been a great deal of gossip about his motives and the nature of the special piece of work which, as he incidentally remarks, is now occupying his time. Abdications by great statesmen have been as rare in England as abdications by monarchs, and of late so many Parliamentary leaders have remained in harness till past eighty years of age that people are surprised when a man so full of vigor—physical as well as mental vigor—as Mr. Gladstone, talks of passing his declining years in peace and meditation. His friends, however, have no cause for surprise, for he intimated long ago that he always intended to preserve, if he could, the last years of his life for rest and seclusion, not only to prepare himself for quitting this world, but to find some leisure for projects of study which he had looked forward to ever since youth, and which the pressure of business had forbidden him to carry out. His enemies and detractors, of whom there are plenty among his nominal supporters, insist that he is moved by mortified pride and resentment at his defeat a year ago. Others complain that he forsakes his party in adversity, just when it wanted all his powers to rally it and reunite its discordant sections. But the truth is that he was tired of politics some time before the fall of his ministry, and had stated explicitly then that he would never form another; and though he would probably have continued to lead had the Liberals been still in power, he doubtless feels that to lead them in Opposition is not specially his vocation—not a task for which he is as well fitted as some inferior men might be. He is a great statesman, a great orator, a great administrator; but he is not, he has never been, a great party leader. At supreme moments he is able to rouse the mass of his followers to enthusiasm, but in ordinary times he is too much occupied by his own ideas to feel the pulse, so to speak, of a party and keep himself quite *en rapport* with them. He wants many of the ordinary sentiments and prejudices of Englishmen, and has no taste for many of their pleasures; and this is one of the causes which have prevented him from being personally popular outside a small circle of intimate friends. In fact, he is not distinctively an Englishman at all, but a Scotchman—a good specimen of the Scotch character on its fervid Celtic side, which is quite as truly Scotch as the cautious Teutonic side. Fervor was all very well when he was carrying through great measures, but now a different sort of general is needed for the defeated and dispirited army; a general who will be calm, watchful, crafty, patient, prepared to take advantage of every slight mistake, and to win back his ground by frequent skirmishes rather than by attacks in force. Now, this is just what Mr. Gladstone is not suited for, and he knows it himself. He would tire of a merely watching policy, and would feel that his powers were being wasted with no corresponding result. The premiership—that great prize which dangles before the eyes of an Opposition leader in England—he has already enjoyed, and would not care to regain. The questions which have now most interest for him are ecclesiastical questions, and his views on these are opposed to those of the great bulk of English Liberals, two-thirds of whom are prepared for the disestablishment of the Church of England, from which Mr. Gladstone recoils, and nearly all of whom are opposed to those High-Church or sacerdotal theories to which he still clings. He would, therefore, in those very discussions that most keenly interest him, either have to sacrifice his own feelings to those of his followers, or submit to see himself deserted by them. However much, therefore, one may regret his retirement from public life, it cannot be considered a mistake; and still less can we believe that it is due to mere spleen and disappointment.

It is not the less a great loss, a great misfortune, to England. He has been far the greatest public man of his own generation, and greater, so far as one can judge, than any public man since the days of the second William Pitt, or, at any rate, of George Canning. Wiser and more far-sighted statesmen she may perhaps have had, and she has certainly had more popular and adroit ones. Peel, Lord Melbourne, Lord Palmerston, men themselves very different, were in these qualities his superiors; while in single flights of eloquence Mr. Bright seems to most of us to surpass, and Mr. Lowe almost to rival, his best performances. But Mr. Gladstone, taken all in all, overtops every and each of these contemporaries and predecessors. There is a largeness, a force, a versatility, an ardor about him which appeals far more powerfully to one's imagination than does Peel with all his frigid dignity of wisdom, or Canning with his somewhat superficial brilliancy. There is also a moral elevation about him, an imaginative amplitude of conception, a sensitiveness of conscience, which, though they have sometimes led him into mistakes, have been of the greatest service in raising the whole tone of English politics and public men. There is a "note" of purity about his words and acts rare at all times, and rarest in a man whose whole life has been passed in seeing and dealing with many of the meanest sides of human nature.

"Why, then," it may well be asked—"why, with all these gifts, has he excited so much personal hostility? Why was he driven from power by so decisive an expression of the opinion of the country a year ago?" The general political causes might easily be stated, but they are at this moment less interesting than the causes personal to himself. These are worth examining. No man has more conspicuously than Mr. Gladstone what the French call *les défauts de ses qualités*. His force spends itself on occasions when it is not really wanted. His ardor runs away with him, betrays him into imprudences, causes him to attach an undue importance to things the rest of the world cares little about. The wonderful activity of his mind makes him anxious to exhaust the possible views of a question; and he often goes on stating one proposition after another with so many qualifications and restrictions that his hearers become altogether puzzled. Mr. Cobden once said, "There is no one whom I listen to with more constant pleasure and admiration than Gladstone, but I mostly ask myself, when he sits

down, what, after all, did he mean to say?" This complexity of mind—people call it subtlety, but it is really rather a sort of manifoldness—inspired distrust in some Englishmen and anxiety in others. The suspicious thought that it covered crafty designs, and that he was preparing to desert his former principles. The man of ordinary common sense got lost in the maze of apparently conflicting views, and did not know what to expect. He wanted from his leader a simple Yes or No, and this was the very thing Mr. Gladstone would not give him. There were also two classes of Englishmen, both influential, to whom he was specially offensive—the luxurious London world which calls itself "society," and the sceptical cynics of the press. His private life was known to be singularly pure and not untinged by asceticism; he showed none of that sympathy with the turf or any of the numerous forms of English "sport" which made Lord Palmerston popular. He took no pains to win over the plutocracy by social attentions, and refused to sanction those bits of military or naval or civil-service jobbery to which the aristocracy thought itself by long usage entitled. The plutocracy and the aristocracy, therefore, disliked him, and all the more because he did not himself belong to one of the old houses. Then the Liberal, or the nominally Liberal, dailies and weeklies are chiefly in the hands of men specially hostile to Anglicanism and to sacerdotal pretensions generally—hostile, also, to anything like the expression of emotion in political matters. In their eyes, Mr. Gladstone's ecclesiastical views and his sentimental tendencies (though it is fair to admit that these latter never affected his economical policy) were not merely obnoxious but almost contemptible. They resented even his expressing an interest in theological questions, and were never tired of contrasting Mr. Lowe's cynical contempt for such matters, and Mr. Disraeli's well-assumed philosophical airs, with what they called the obsolete mediævalism of Mr. Gladstone. And even outside this circle there was a good deal of the feeling which made the Athenian farmer ostracise Aristides because he was tired of hearing him called the Just. The tone of society in a luxurious metropolis is never very high. Mr. Gladstone's private virtues were too frequently turned to account for political purposes by his less judicious supporters, and the *Daily Telegraph* in particular, the most tasteless of all English newspapers, did its best to make him ridiculous by its gushing praises. These may seem slight things, and so they were separately, but taken together their effect was considerable. At first they operated exclusively in London itself among members of the two Houses. There was a good deal of latent disaffection in the House of Commons even before the last general election, when Mr. Gladstone was nominally in a large majority, and it was no secret that many Liberal members were kept from deserting by the fear of their constituents. By degrees, however, the same sort of feeling stole over England (though Scotland remained faithful); people suspected the Premier of not being a sound Protestant, and many who could not have given any definite reason for their slackened zeal admitted that they were less enthusiastic for him than they had been at the election of 1868.

Unjust as most of the charges brought against him have been, it must be confessed that he was too neglectful of the small but legitimate arts by which popularity is won and retained. More might have been done to humor ordinary members of Parliament, and conciliate them by the social attentions of which Lord Palmerston was a master. More might certainly have been done to rear up a school of young statesmen like that formed by Peel, of which Mr. Gladstone himself was the most brilliant member, but which included also Mr. Cardwell, Sidney Herbert, the Duke of Newcastle, in a certain sense Lord Selborne, and other less distinguished persons. Mr. Gladstone was too much absorbed in great administrative schemes and in his own studies to attend to this; but the unfortunate consequences are seen now in the absence of the youthful champions by whom he ought to have been surrounded and defended. This is the stranger because he is himself of a far more sympathetic nature—a man who would naturally inspire more enthusiastic attachment—than the cold and stately Peel. One of the most ominous features in the present political condition of England is the difficulty which young men of ability and high education experience in finding a seat in Parliament, and the increasing proportion there of persons who enter it either to promote their commercial schemes or to improve their social position and gratify the vanity of their wives. This is a danger to whose existence Mr. Gladstone has shown himself alive. But no Liberal Government has done anything to meet it. It was, according to English arrangements, a matter not falling within his own department, so that he cannot be directly blamed. But a word from him would have gone far to influence the party managers, and it does not appear that any one reminded him to say that word. The party managers have, as a matter of fact, been content to get in men on whose votes they could count without thinking of the quality of the men themselves. And so it happens that at present there are in the House of Commons very few men of promise below the rank of cabinet or ex-cabinet ministers, and of these few scarcely any under the age of forty-five. This is about as true of the Conservative as of the Liberal side. Ministers and even leaders for the next generation will of course be found when the time comes, but to all appearances they will be intellectually inferior to those of the generation that is now beginning to pass away. There will at any rate be no one among them to be for a moment compared to Mr. Gladstone. Mr. Disraeli remains to amuse the House of Commons, though even he will not now have the same motive to exert his full powers; and he too is hardly like to remain long. Of the rest, there is no one to whom it is any pleasure to listen, for Mr. Bright seldom appears, and still more seldom speaks. Political life in England, to all appearances, is at the beginning of a long reign of mediocrity. There are solid thinkers; there are smart debaters; there are skilful administrators. But there is no man of genius.

## ENGLAND—LORD HARTINGTON AND HIS FOLLOWING.

London, January 30, 1875.

THE question of the leadership of the Liberal party has been agitating the country during the last fortnight, and as I write it is no nearer solution than it was the day that Mr. Gladstone announced his retirement. The choice has been (unfortunately, in my opinion) limited to two men, Mr. Forster and Lord Hartington, while the fittest man in the late Cabinet to meet the present emergency, Mr. Göschen, has been passed over. The newspapers have been so full of criticism upon the social, political, parliamentary, and personal qualifications of the two candidates (if those can be so called who are sought after rather than seeking), that I do not propose to trouble you with any views of mine on such a delicate subject, worn threadbare as it is. But I may put shortly such opinions as I have been able to gather of what will probably take place, according as the one or the other is selected, at a meeting which has been called for the purpose.

Let us suppose the meeting over (as it will be before you get this) without superfluous scandal, and the decision given in favor of Mr. Forster. What effect will this produce on the ranks of the party? The Nonconformists outside the House of Commons—Mr. Forster's own constituency at Bradford taking the lead—have openly, ostentatiously almost, announced that they will own no allegiance to him who was the author of the Education Act, which was passed in defiance of their views and in the interest of the Established Church. This Nonconformist body is the backbone of the Liberal party as at present constituted, and without them the Liberals—in so far as they are a party—may throw up the sponge and retire from active political life. It is true that they are not very numerous within the House of Commons, nor so practical as they are outside, but the desertion of even forty or fifty true-hearted Liberals is a solemn fact in the present state of matters.

More determined, even, than the Nonconformist enmity is the deep-rooted aversion to Mr. Forster of the old aristocratic Whigs. He might in time conciliate the Nonconformists, because their objection to him is based on acts and facts which might be got over or condoned. In natural disposition and general political leaning, outside the sphere of education, he is probably more with them than with the Whigs. The latter cannot or will not put their feelings into language. But the separation between them and Mr. Forster is deeper already than it ever was between them and Mr. Gladstone, and it is hardly possible that it can fail to increase. Mr. Gladstone was a churchman, a distinguished university man, a man of birth and high connections; and, in addition to all those merits in the Whig estimate, he

was a man of genius. Mr. Forster is essentially a middle-class man, with sympathies which, rightly or wrongly, are supposed to be not unlikely to lead to Radicalism. Hence the Whig aversion to him. These two sections of the party—the Nonconformists and the Old Whigs—being thus clinched, who would be left for Mr. Forster to lead? The Irishmen—for what they are worth—would be more likely to follow Mr. Forster than any other leader, on account of the favor he has shown to the Denominationalists. The Scotchmen have ever been amenable to reason, and will probably follow the man who is selected, whoever he may be, with a fair amount of unanimity; and then he has the section of the party who are urging on the meeting—men of some influence and, for the most part, of advanced opinions. But against this following, such as it is, must be put the "caves" and combinations which the Whigs, led not improbably by Sir William Harcourt, will form, and the antagonistic attitude of the Nonconformists.

And now let us suppose that Lord Hartington has been elected. The Whigs will support him with something as near to enthusiasm as their natures will allow them to display. With an earl leading in the Upper House and a marquis in the Lower, the country in a sleepy and contented state of torpor, and a government of Liberal-Conservatives passing Whig measures, it will appear to them as if something like the good old times had come back again, and the Whig millennium—in opposition though they be—had recommenced. The Nonconformists will be ready to give allegiance just at first, provided Lord Hartington does not throw too much cold water on their pet schemes for dismembering the Church of England. But his frank announcement this week at Lewes that he did not agree with Mr. Bright's attack upon the Church last Monday at Birmingham, will damp some of the ardor in his favor which the name of Mr. Forster has engendered in the Nonconformist mind. The Scotchmen would follow Lord Hartington if he showed capacity, and so would all the moderate-minded men. The Irishmen liked him when he was Irish Secretary; but his outspoken condemnation last year, in the best speech he ever made, of the Home Rule project to disintegrate the Empire, has rather alienated the most ferocious and patriotic among the Irish members. The extreme men, and many of those who got up the requisition for the public meeting, and who are mainly Mr. Forster's partisans, will be opposed to him—not a few for a similar ground to that taken up by the Whigs against Mr. Forster, the fact mainly of his birth and bringing up. The Whigs will not follow a Bradford manufacturer, and the Radicals will not follow the son of a duke.

It is a curious episode in the history of English politics. But it brings out in bold relief the fact that has too much escaped attention in this country, though noticed by Mr. Disraeli long ago in 'Coningsby'—the fact, namely, that the old division of parties is flickering out its existence, and that we are arrayed against each other not so much as party against party as class against class. The old Liberal party, now disorganized, was not a party. It was a coalition of classes combined for a particular purpose under one great leader, and so soon as that purpose was accomplished and that leader's magical influence removed, the coalition of classes fell back into its constituent elements. The animosities which exist between the various sections of the coalition are, at least, as bitter as any animosity that exists between the old Liberal and Conservative parties. For some time to come and in the freedom of opposition we shall find these sectional animosities asserting themselves recklessly on the opposition benches. Many old scores, which were smothered when the members of a nominal party sat together on the ministerial side of the House, will be wiped off before the fragments of the party cohere again. Prospects of regaining power may in time bring together the different sections of the party as then composed into a new coalition. Disestablishment may then come into prominence, or household suffrage in counties and redistribution of seats, or revision of the land laws, or whatever it may be. And with the question the leader will be found, not by competitive examination or by counting heads or by the ballot-box, but by the natural selection of the fittest. Till then it really matters little who is the nominal leader of a disorganized opposition. But in the meantime the Conservatives, if they use their opportunities wisely, will have an easy tenure of office.

## GENERAL SCHENCK AND DRAW-POKER.

London, January 18.

I THINK we have touched bottom at last. It has for some time been a matter of curious enquiry among Americans in London how low the reputation of an American Minister could sink, and what new circumstances could provoke a more general derision of his name and office. A letter published in the *Morning Post* of to-day seems to have been composed expressly to answer these questions. It strikes me as likely to elicit some comment on your side, and I quote it in full:

"THE AMERICAN PRESS AND GENERAL SCHENCK.

"*To the Editor of the Morning Post:*

"SIR: It appears from recent files of American papers that many of the inquisitive journals of the United States are occupying themselves with a strange *canard* about the conduct of their Minister in this country, who is persistently accused of being a gambler, of introducing to us the game of 'poker,' and of having written 'a book on the art of gambling.' They consider this to constitute a great scandal, and even base upon the accusation a demand for his excellency's recall. The game of 'poker' is with them one of small repute, chiefly played in the West and on board the Mississippi steamboats, and is no doubt widely used by the gamblers of that region. In itself it is a simple combination of 'commerce' and 'brag,' with some few special technicalities. The mixture of chance and judgment renders it amusing, and some years ago it made its appearance here as a round game in social gatherings.

"Now, sir, it falls within my personal knowledge that one day in the drawing-room of a lady of high position in the London world, General Schenck, at her request, put down upon paper the rules of 'poker,' and these rules were printed without the knowledge of the General. The story of the 'book' is therefore quite absurd. But these accusations acquire importance on the other side of the Atlantic from the puritanical spirit so strong in the United States, and from ignorance of what is usual in English society. They do not understand that such a game as 'poker,' played, as it is here, for small stakes—usually counters representing pennies and sixpences—is perfectly admissible among ladies and gentlemen, and in the best company.

"Of course such attacks may be treated with the contempt they deserve, but it may be still better to enlighten the darkness whence they proceed, and to inform our cousins, at the risk of shocking them, that at Christmas parties ladies and children have indulged in such games as blind hookey, rouge-et-noir, and 'poker.'

"I am, sir, your obedient servant, FAIR PLAY."

I say that, assuming every word in this letter to be true, it is a degrading letter—degrading to General Schenck, humiliating to us his countrymen in London, and to his countrymen elsewhere. It is possible now to sympathize with the feelings of the indignant constituency which discovered that their representative at Albany had sold himself for a price ludicrously below the market rate of assemblymen in that year. So long as General Schenck's name stood at the head of one of the largest frauds ever carried through the London Exchange, he may have thought the magnitude of his offence some atonement for it with citizens of what he dilated upon at Sheffield as the biggest country in the world. But who can find pleasure in having his Minister publicly apologized for as a poker player? Let us see what the apology is.

"Fair Play" is either an Englishman or pretends to be one. I hardly think anybody but a genuine John Bull would have described poker as a game chiefly played "in the West *and* on board the Mississippi steamboats." He calls the story a "canard." The story is that General Schenck introduced here the game of poker, and wrote a treatise on it which was printed. That story is not a canard, but is true. I don't know where "Fair Play" got his variation of it, nor does it matter. The substance of the accusation is what matters, and that cannot be escaped from by a quibbling statement of it. Whether General Schenck wrote his treatise at the request of a lady of high position in the London world or not is of no consequence. "Fair Play" says it falls within his personal knowledge that he did. Be it so. And that these rules were printed without the knowledge of the General. Be it so again, if "Fair Play" means that that statement also is within his personal knowledge. But it is also within my personal knowledge that General Schenck's authorship of the poker pamphlet was notorious, and that copies of it were in his possession and were given away by him. That being the case, how is his responsibility for it to be evaded? I have seen a copy which had been presented by General Schenck to an English lady with her name in his handwriting on the cover. It is a little square, thin, pink-covered thing of—if I recollect rightly—fourteen pages. It is systematic; a collection of rules and maxims for the playing of the game, perfectly serious in tone, and by no means the sort of instruction given for a game to be played for amusement merely. You hear the clink of the dollar in every sentence. I could have sent you the whole of it for publication, but to what good end? There were scandals enough about General Schenck already. I have no wish to add to the number of them.

Let nobody suppose an American abroad can find any pleasure in attacking a representative of his own country. But the scandal has grown daily more rank; it was not honest to keep silence on such public matters touching so nearly the honor of the United States. For the same reason it is impossible to be silent any longer about this wretched poker-playing gossip. "Fair Play" says it acquires importance from our puritanical spirit, and from ignorance of what is usual in English society. I don't think it becomes an American Minister to put forward an apologist in an English paper. Nor do I think that a good apology which depends on a sneer at his own country. It is not true that the accusations against Gen-

eral Schenck acquire importance from ignorance of what is usual in English society. It is *not* usual in English society for a Foreign Minister to introduce draw-poker and publish a treatise about it. I do not know any other Foreign Minister who derives notoriety from an act of that kind. Nor is General Schenck believed to play usually for "pennies and sixpences." His reputation is that of a man who plays for more money than he can afford to lose. So true is this latter statement that certain other ugly stories about General Schenck's money affairs have been thought to be based on, or are confirmed by, the account of his gambling habits. Were it a mere question of playing for sixpences, or even whist with half-guinea points, the club limit, such talk would not have been heard. Yet a man may lose a round sum of money in a night even at whist with half-guinea points, especially if the bets are unlimited.

Further, so far from taking a "puritanical" view of this matter, I am willing to concede that nothing need have been said about General Schenck's play had he merely conformed to the habits of the society in which he mixed. But General Schenck places himself in a very different position when he avails himself of his ministerial position to introduce a game which is purely and simply a gambling game; and practises it, playing for money with those to whom he has taught it, and acquiring social notoriety from having introduced it, and from his repute of playing for considerable sums. Why does not "Fair Play" tell us it was to divert attention from that other ill-fame he won long before from the Emma Mine? It would be a much better excuse than the ridiculous palliations he asks us to accept.

I will not extend my comments. I leave much unsaid because, disagreeable as it is to hear such remarks as are habitually made in conversation about General Schenck, it would be more disagreeable to repeat them in print. I confine myself to such as he himself and his friend "Fair Play" have made public. It is needless to repeat that they must shock the moral sense of the American public, and that the relation of General Schenck here as Minister of the United States brings the Government which he represents into contempt. Suspicion of some complicity at Washington with Emma Mine rascalities was long rife. I do not know that it is yet allayed. I do know that the victims of that fraud have not forgotten or forgiven it, and that they hold Gen. Schenck morally responsible for their losses. All that is an old story, but old as it is you come upon it almost daily. You can scarcely hear Gen. Schenck's name mentioned without an explosion of wrath, or a sneer, or a laugh, or an expression of amazement that he is still kept here as Minister. Now that he—or a friend for him, which comes to the same thing—has begun explaining his poker performances, it may be that we shall have another series of letters and articles in the London papers on the Emma Mine. That would make it still pleasanter.

AN AMERICAN.

# Notes.

SOME weeks ago we referred to the severe criticism passed by Dr. H. Kiepert, in the Berlin Geographical Society's *Journal*, on Dr. Wm. Smith's new 'Historical Atlas,' and particularly on the map of Palestine, which, as the reviewer said, neither embraced the latest discoveries of the Palestine Exploration Fund, nor even took advantage of his own labors in the same field. This map of Dr. Kiepert's has now reached its fourth revised edition, and bears the date of 1874. It is a large affair, in eight sheets, for hanging on the wall. No words of ours could add weight to the authority of the eminent compiler. The Berlin publisher is Dietrich Reimer, and the map may be had in this city of Mr. E. Steiger, 24 Frankfort Street.——An excellent feature of Col. Higginson's 'Youth's History of the United States' is the list, at the end, of works that may be read or consulted for each period; and among them the historical novel finds its proper place. The historical fiction of all nations has lately been made the subject of a Chronological Index, of which the second edition has been sent us, by the Boston Public Library. Like many others of the catalogues of this enterprising institution, the present is well adapted for circulation outside of the immediate patrons of the library. It does not profess to be complete, but it is remarkably full. The term "historical," applied as broadly as it is here, permits the most inveterate novel-reader to take shelter behind it, just as "opera" quiets scruples which exist against the "theatre." Poetry and the drama are included along with tales.——The January number of the *New England Historical and Genealogical Register*, while possessing its usual interest for those immediately engaged in genealogical pursuits, has nothing more attractive for the general reader than the opening paper—a sketch of the descent and career of the late George B. Upton—and the annotated "Diary of Dr. Ezra Green," who was surgeon of the Continental ship-of-war *Ranger* during the cruise (November 1, 1777–September 27, 1778) which Capt. John Paul Jones led her about the British coast. Both these papers are worth reading.——Claxton, Remsen & Haffelfinger, Philadelphia, have in press 'Secrets of the Sanctum—an Inside View of an Editor's Life,' by A. F. Hill.

—A correspondent points out a curious blunder in Webster's Dictionary, by which, under the word *reins*, meaning the kidneys, etc., the following phrases appear as tropical uses of it: "*To give the reins*, to give license; to allow to be without restraint. *To take the reins*, to assume control." This would seem to be a mere transposition of the types were it not for the fact that the same usage is correctly given in almost the same words under "*rein*, the strap of a bridle, etc." Our correspondent continues: "It may also be of interest to note a series of marvellous blunders in a list of irregular verbs appended to Oehlschläger's English-German Dictionary, a work which I believe has at least a certain sort of popular authority, and which in 1869, as shown by the title-page, had reached its thirteenth edition. There are quite a number of such curious and obsolete forms as 'bake, baked, backed, baken, backen,' 'it betides, betid, betid,' 'fleet, flet, flet, etc.; but the climax is capped in 'wax, wox, waxen,' and 'it snows, snew, snown'! The title-page states that the author was "formerly Professor of the English language in the College of Quebec," and the query naturally suggests itself, did all the students of this institution talk out of the Canterbury Tales?"

—Gen. Hazen has followed up his instructive article in the *North American Review* on the "Great Middle Region of the United States" with a pamphlet entitled "Our Barren Lands" (Cincinnati: Robert Clarke & Co.) This latter is in the nature of a personal defence against the imputations of Gen. Custer, who had denounced him for saying in a letter to the *Tribune* a year ago that "a large proportion of the lands of the Northern Pacific Railroad were worthless, both for agriculture and as a security for money." Gen. Hazen's object is to prove, and he does it in perfect temper, that his statements are fully borne out by the facts; that Gen. Custer spoke from an experience of only two years, quite exceptional for their rainfall; and that the vast interior region lying between the 100th meridian and the Sierra Nevadas, and stretching from the northern boundary to the Gulf, is an arid waste unfit for agriculture except in rare localities where mountains favor irrigation, yielding no profit and scarcely any returns to the farmer, and exposed to the mischievous effects not only of drought but of grasshoppers. As to the valley of the Upper Missouri the description of it given by Lewis and Clarke, which Gen. Hazen cites, holds good to-day: the bottom lands are narrow and hemmed in between the hills and the river; and though the soil is rich, the absence of timber and the scanty supply of good water "oppose powerful obstacles to settlement." From Oct. 15, 1804, to May 28, 1805, they had but one shower of rain. A more recent witness, who has resided nearly nine years in Montana and Dakota, avers that successful farming is an impossibility in these Territories without irrigation, which is out of the question in Dakota, and is only exceptionally available in Montana. To encourage emigration thither he pronounces a monstrous fraud. "When I think," he says, "of the enormous lies promulgated by paid advocates of the Northern Pacific Railroad Company, who describe the land as 'a scene of never-ending beauty,' etc., I am constrained in charity to ascribe this not to a deliberate desire to falsify, but to the poetic tendency of the times." Gen. Hazen, however, has less faith in poetry than his correspondent has. He declares "the stories of the 'Tropical Belt,' the 'Continental Wheat Garden,' the 'Attractive Country,'" and the like, to be the "puerile inventions of the late witness, literary stockholder, and literary agent of the Northern Pacific"—the same who made public the "tripartite covenant" of Brooklyn notoriety—"aided by other writers of the country, both employed and volunteer," and "continued and animated through the instrumentality of that great moral power the *Independent*, for which services that leading Christian newspaper of the world was given a previously unheard-of compensation." Gen. Custer's rose-colored report of the country in his gold-hunting expedition to the Black Hills is dissected by Gen. Hazen, and shown to be false and misleading from a mere comparison of it with the accounts of other members of the same expedition.

—A matter of more than ordinary interest discussed in President Eliot's report on Harvard College, to which we recur once more, is the relation of the public schools to the college. From statistics given by Mr. Eliot, it seems that the high-schools of Massachusetts, though originally intended to fit boys for college, perform this function only to a very limited extent. There are, he says, good reasons for this. Most public schools being conducted with the settled object in view of bringing every

child up to a moderate standard of excellence, there is necessarily a great deal of repetition and drill, which involves a terrible waste of time for the more intelligent children. These children are, however, the very ones who ought to go to college, and the result is that it is seldom for their interest to remain in the regular classes of a public school. There is another reason :

"Again, all the colleges require for admission a knowledge of Greek, which it takes a boy of average intelligence a full year's study to acquire. Now it is plainly not the interest of the great mass of boys and girls who go to high-schools to study Greek at all, and they do not study it. The teaching of Greek must, therefore, be maintained in a high-school at a considerable expense for the benefit of only two, three, or four per cent. of the pupils. A large part of the time of the most expensive teacher in the school is thus lost to the many scholars and given to the very few. This immediate and certain sacrifice school-committees are less and less willing to make for the sake of a remote and contingent good. The difficulty is of course less felt wherever, as in Boston, a separate high-school is provided for each sex ; and it may be hoped that the day is not far distant when, with the spread of physiological and pedagogical information, the practice of providing separate high-schools for boys and for girls may, in the interests of both sexes, become universal."

It is of great importance, as Mr. Eliot very justly says, "that the way be kept wide open from the primary school to the professional school (*i.e.*, *via* the college) for the poor as well as the rich," and he suggests that the desired connection between the secondary schools and the colleges might, in part, be secured by changes in the requisites for admission to college on the one hand, and in the studies of the existing high-schools on the other.

"If the colleges would accept, at the option of the candidate, a year's work in French or German for the year's work in Greek which they now require, and the high-schools would make Latin a substantial part of their course of study for all pupils, the desired junction of the two classes of institutions would be practically effected. In the sole interest of the colleges there is much to be said in favor of such a change in their requisitions for admission, and in the interest of the high-schools there is much to be said in favor of making Latin an important part of their prescribed course of study."

This recommendation has, we believe, created a good deal of discussion in Cambridge among the friends of the college, who understand it to mean that Greek as a required study, either before admission or after admission, is to be thrown overboard, and who object to it that it is rather a proposal in the direction of lowering the standard of the college than of elevating that of the schools.

—The controversy which has long raged both in England and this country over the vivisection of animals by physiologists, and which, in this State, has recently threatened to produce prohibitory legislation, has led to the publication of an interesting little brochure on the subject by Dr. J. C. Dalton, Professor of Physiology in the New York College of Surgeons and Physicians, setting forth the character, necessity, and results of experimentation on animals (F. W. Christern). As an illustration of the needfulness of some such discussion of the subject as he offers, he quotes a writer on the other side in the *Evening Post*, who maintains that, even if vivisection is as useful from a scientific point of view as its advocates pretend, "mankind has no right to the knowledge thus acquired," and demands legislation "to put a stop to these wicked contributions to human knowledge which mankind would be all the better off for never knowing." The gentleman who said this is evidently not a person to be argued with ; but there is a large number of persons who, while holding liberal views as to the claims of science, labor under great misapprehension as to the character and utility of vivisection. Nobody who eats meat can well deny the lawfulness of making the lower animals subservient to the preservation of human life, and when we show the carnivorous, as Dr. Dalton does, that no more pain is inflicted in vivisecting animals for scientific, than in killing them for gastronomic purposes, and that vivisection has made, and is making, contributions of great value to the medical art, we do not need to argue, as far as they are concerned, whether there be any attainable knowledge which man has no moral right to acquire.

—In the first place, all experimentation on living subjects is performed by physiologists after the use of ether. There are often cases in which the object is the discovery of the existence of pain under certain conditions, but in these cases the pain inflicted is slight and brief, for it does not need to be either sharp or prolonged in order to attain the operator's ends. It cannot be said, in fact, that scientific men ever torture animals, in any proper sense of the term. In the second place, the phenomena of life, which are the main objects of interest to the medical man, can only be observed in living animals, especially in that most important field, the relation of the nerve system to the vital functions. Some of Dr. Dalton's examples of the contributions which vivisection has made to medical science in this field are highly interesting. Through some of the experiments now going on, for instance, it seems probable that we are on the eve of the discovery of the cause, and therefore, perhaps, of the cure, of that terrible disease diabetes. Then the circulation of the blood was discovered in this way ; so was the function of the lungs in aerating the blood ; so the possibility and value in certain cases of artificial respiration ; so the possibility and value of the transfusion of blood ; great light has been thrown on the digestive process in the same manner. Nearly all the knowledge we have of the nervous system comes from the same source, and particularly the fundamental and most fruitful fact of neurology, that "the anterior and posterior roots of nerves emerging from the spinal cord have distinct functions, the anterior roots being channels for motion, the posterior for sensation." The Hunterian operation for aneurism was made possible by previous experimentation on dogs ; and the regeneration of the bone, after fracture or disease, through contact with the periosteum (a fibrous covering in which it is encased), was ascertained in the same manner. The proper mode of treating venomous wounds, and the origin of parasitic diseases, are also among the contributions to human (and, let us add, also to brute) happiness made by dogs, mice, rabbits, pigeons, pigs, and other animals; and anybody who objects to experiments on them ought to be prepared manfully to have himself and his family treated, in case of accidents or disease, as if no vivisection had ever been performed. To protest against and denounce a thing, while profiting by it, is not only illogical but base.

—Miss Putnam is not satisfied with Dr. Ruffner's report, and writes to us :

"These are the distinct points at issue :

"The School Report (1871) shows, from a very thorough and complete census, there were 1,248 white and 1,097 colored children of school age in this county. The School Reports also show there has been expended in the four years, for school purposes, a total sum of $14,355 55. From the best data at my command, the sum expended for colored schools in the four years has been about $2,095, *one-seventh* of the whole, when an equitable share would have been *seven sixteenths*, or nearly one-half. There are in the county about five hundred colored men who pay their capitation-tax of one dollar each per year, and their property-tax, for school purposes, which for the four years would be equal, or more than equal, to the sum expended for their benefit. For three years the colored men of Wicomico, with 234 school population, paid their tax, *and had no school*. There was 178 white school population in Wicomico, who had expended for its benefit, in those three years, from the school fund, $1,776 49. The statistics in regard to Wicomico are all from the 'Virginia School Reports,' and should be conclusive evidence. The information I explicitly call for, and respectfully ask Mr. Ruffner to obtain from official record, is the *amount of money* expended and *to whom paid* for *colored schools* in Northumberland County since the introduction of public schools in the State. With this knowledge, and the statistics furnished by the annual State Reports, it can be easily determined how fair and impartial have been the distribution and efficiency of the school system for the colored children in this county, so far as the public money is concerned. I beg your readers will notice Mr. Ruffner is careful to say the colored children have 'one-third of the benefits,' having one-third of the 'number enrolled in the schools' in the State ; and not that they have *one-third of the school fund expended for their benefit!* The School Report for 1874 gives 19 white schools and 8 colored schools in Northumberland County, still showing unfairness, notwithstanding the 2 new schools in Wicomico."

It seems to us that Miss Putnam here makes up her charge by lumping together four years, during two of which the Virginia authorities admit that no provision was made for colored children. What they say is, that they are increasing their school accommodations, and that the law does not require it to be complete before 1876. The controversy, therefore, seems to us a barren one ; but, barren or fruitful, it ends as far as we are concerned. We wish, however, Dr. Ruffner would procure for Miss Putnam a sight of the County Treasurer's books, though we must decline publishing the result of her investigations.

—A correspondent asks for information on books relating to the development or evolution theory, especially for the book "which is not too partisan or too technical, but gives the facts and reasoning with reference to it on both sides." From a literature which has in the past fifteen years grown into an extensive department of bibliography, we ought to be able, if this were possible in any subjects of discussion, to select the book which fulfils these requisites. Yet it would be vain to seek, even in Germany, for one which surpasses in these qualities the foundation and first of the series, namely, Darwin's 'Origin of Species,' in which, and especially in the last edition, 1872, all the *scientific* objections that have been urged against the theory, as it is held by Darwinians, are more clearly put and fairly considered than in any treatise we could name. In no work on a subject of which the scientific evidence is essentially technical, is the fault of technicality less obtrusive ; and in late editions this is still further remedied by a glossary of scientific terms. But before we can clearly characterize other

books on this subject, it is necessary to make a grand division of the department into books that are strictly (like Darwin's), or predominantly, scientific and inductive; and those that treat their subject as a part, or as the foundation even (like Mr. Spencer's series), of general speculative philosophy, and in connection with theology and religion. Darwin's books have been improperly characterized as speculative. This is true of them only in the sense in which incompletely verified scientific hypotheses are called speculative; in the sense in which Newton's astronomy was, until completely, or very nearly, verified; or (by a fairer instance) Newton's optics, which, in a main point, is not verified, but reversed.* It is to the *subjects* of Darwin's books, and not to his opinions or treatment, that the term speculative is applicable, if at all; and so far as it is applicable as a reproach, it applies equally, or even more, to the opinions of his opponents. His mode of treatment is strictly scientific, Newtonian, or "positive"; nowhere dealing with disputed axioms, or with deductions from axioms laid down as *a priori* valid and as if they were not disputed; nowhere considering scientific theses as either favorable or unfavorable to general philosophical or religious conclusions, except, of course, where religious teaching, in having prejudged these questions on other than scientific grounds, is presumed to have exceeded by *obiter dicta* its proper jurisdiction. With the great majority, however, of writers on this subject the names of Darwin and Spencer are closely associated; though to more than one Aristotelian master, and to many scientific students of the subjects, no two names are more widely separated by essential differences of method. Mr. Spencer has lately put forward the claim that his method is justified by Newton's precepts and practice. But, according to the judgment of the more immediate followers of Newton, the leading physicists of to-day, this claim is not substantiated.

—The dispute is, however, quite aside from the reality of the distinction which, for bibliographical purposes, we here lay down. One of the requisitions of our correspondent is not fulfilled by any book of the properly speculative division. We venture to assert that in no department of speculative philosophy, either expository or historical, do treatises exist which fairly present the facts and arguments on both sides. This virtue is possible only within the limits which scientific, Newtonian or "positive" method imposes; and within his own proper department of natural science every expert authority is a positivist, whether on other subjects he denies, or ignores, or only waives the disputed axioms. The essential characteristic of properly speculative as distinguished from scientific method is, that the former seeks to expel doubt by the furcular force of the dilemma that unless one accepts as having universal validity certain axioms, which it is true are only illustrated, not verified by inductive evidences, one is not entitled to hold any beliefs at all with any certainty. Choice axioms are therefore presented, *illustrated*, and a universology is deduced from them. True scientific virtue, on the other hand, is to balance evidences, and to bring doubts to civil terms; to resist the enthusiasm of these aggressive axioms, and to be contented with the beliefs which are only the most probable, or most authentic on strictly inductive grounds. Now in the proper scientific theory of "evolution"—unhappily so-called, as confounding it with a different mode of treatment, when any of the successive preceding names, "descent with modification," "derivation," "development," or "transmutation" would on this score have been better, notwithstanding a temporary disrepute in the name—the scientific evidence is in great measure technical, and a considerable part of what has accumulated in the past fifteen years is buried from the general reader in monographs of scientific publications. Essays and discourses in exposition of Darwinism or natural selection are far too numerous; the majority being better calculated to make the author shudder than to illuminate what is best got from a careful reading of his original treatise. Among brief and good essays we may mention Professor Huxley's little books on the 'Origin of Species,' and 'Man's Place in Nature'; Mr. Wallace's collection of essays with the title of 'Natural Selection' (though some of these are too speculative to come under the head of natural science); and Mr. Mivart's 'Genesis of the Species,' which though learned in biological science, is in many parts too speculative or un-Newtonian to be mentioned under this head. We may add a little book called the 'Philosophy of Evolution,' by B. T. Lowne, published in 1873, by Van Voorst, London, which received one of the Actonian prizes of the Royal Institution for 1872. This is mainly scientific, though it touches on the general philosophical or speculative bearings of the subject. Of works more unequivocally of the speculative class, Mr. Spencer's generally, but more especially his 'Biology,' deserve a first place. We should not, however, in this case, as we do in Mr. Darwin's, recommend the original so much as a recently-published exposition, which, under the title of 'Cosmic Philosophy,' is given by Mr. John Fiske. In this book, the disciple far surpasses the master in readableness and skill of exposition. Of a large subdivision of the speculative class—the books whose aim is practical and religious, and opposed to theories of evolution—no one has come to our notice which fairly presents the exact points or the scientific arguments of the theory as it is now generally held by naturalists, and few of them apparently deem it essential to their aim to do so. Finally, we may add to the scientific division of books on the subject a recent edition of Darwin's 'Descent of Man,' renewed by the fiery ordeal of criticism to which the first edition was subjected, and perfected, so far as scientific fairness and method can go, by the author's unbounded patience of thought and research.

* Speculative philosophy is properly metaphysics, and proceeds deductively from axioms, like Plato's or Kant's, or Mr. Spencer's later form of *a priori* philosophy, which he professes to found, in part, on the empirical facts of heredity, and thus give it a scientific basis.

—Publication of the posthumous works of Fritz Reuter has been begun in Germany, and the first volume is accompanied by a very sympathetic biography of him by the editor, Adolph Wilbrandt. With the full consent of the poet's widow, a frank account is given of his passion for drink (*Trunksucht*), which is rightly regarded as a disease for which there was (after it had once been contracted) no moral responsibility whatever. In the beginning Reuter drank hard in order to forget his misery as a political prisoner in Prussia's clutches, and when after seven years (he had been condemned for thirty) his deliverance came, he carried into private life this periodical craving which must be satisfied, which ran its course like a fever, and from which his wonderful constitution rallied invariably with renewed vigor. But the habit nearly made a wreck of him. He wanted to become a painter, in opposition to his father's wishes, who sent him back to the University to study law. Here the temptation to spree was too much for him, and he next devoted himself to farming, with indifferent success, eking out his support by teaching. In this career he gained the friendship of a Pommeranian landowner, to whose confidence in him and shrewd knowledge of human nature Reuter owed the fortunate marriage which rescued him from an obscure and perhaps melancholy fate. This friend, knowing Reuter's betrothed to be troubled with scruples about the match, dared to lead her where he lay under the influence of one of his attacks. The result justified his calculations. She resolved to undertake the saving of a life; and though she failed, as other trusting wives had done before her, to destroy her husband's appetite for drink, she had the rare consolation of seeing neither his constitution nor his morals undermined by it. The wedding took place in 1851, and Reuter died only last July, of heart disease. At least as early as 1866, however, his powers as a writer had reached their climax. The history of Mecklenburg, which he left unfinished and which now appears in print for the first time, dates from 1859–62, and is pronounced not inferior to his best work. It is a singular circumstance that the dialect which contributed so much to his fame was not originally nor spontaneously employed by him. His earliest writings were in High German, including his masterpiece (1847), which was afterwards put into Plattdeutsch with the title 'Ut mine Stromtid.' The example which he followed so profitably at last was set him by Klaus Groth, whose 'Quickborn' appeared in 1852. The drollery which characterizes Reuter's works found ready acceptance with the Mecklenburghers, who are never weary of hearing and telling humorous stories; and Reuter not only had a great store of these but told them exceedingly well before he ever put pen to paper.

## PROFESSOR MASSON'S ESSAYS.*

WE always read Professor Masson with interest, but never without a certain feeling of disappointment. He is clear, shrewd, and vigorous, and his style (when it is not Mr. Carlyle's) is quite his own. He attempts to deal with subjects in a first-rate manner, and yet, at the last, he fails to give an impression of first-rate power. He is, in a word, in thought and expression the least bit vulgar. He is fond of rhetoric, which is perfectly legitimate; but his taste has odd lapses. He writes literary history in the picturesque manner; but it is amusing to have a writer of his apparent sincerity reminding us of Mr. Hepworth Dixon. When Chatterton, in the author's biography of the young poet, writes to Horace Walpole, we are told that "whether from the suddenness and naïveté of the attack, or from the stupefying effects of the warm air in his library of a March evening, Walpole was completely taken in." Dryden made an attack on Elkanah Settle, the bad poet. "Settle," says Professor Masson, "replied with some spirit,

* 'Three Devils: Luther's, Milton's, and Goethe's. With other Essays. By David Masson, M.A., LL.D., etc.' London and New York: Macmillan & Co. 1874.

with little effect, and was, in fact, 'settled' for ever." We doubt whether Mr. Hepworth Dixon, indeed, would have risked that. Professor Masson has been republishing some of his early essays, and one volume of the series was lately noticed in these pages. They were worth such care as he chose to bestow upon them; but it is a pity that this should not have included a little chastening of the style. The first of the volumes before us contains a study of the differences in Luther's, Milton's, and Shakspere's conception of the Devil, a parallel not particularly effective between Shakspere and Goethe; a sketch—the best thing, perhaps, in the book—of Milton's youth; an essay on Dryden; a "picturesque" account of Dean Swift; and some reflections, noticeably very acute, on "One of the Ways Literature May Illustrate History." These things are all entertaining, and some of them interesting. It is particularly interesting, perhaps, to investigate people's ideas about the Devil, and Professor Masson sets forth very justly the respective characteristics of Milton's Satan, Goethe's Mephistopheles, and the Foul Fiend who haunted the great Reformer. Luther's devil was properly the only real devil of them all, the only one who carried with him a need of being believed in. Milton's Satan was an exalted poetic conception, in which the idea of evil was constantly modified by the beauty of presentation. Mephistopheles was the exquisite result of Goethe's elaborate intellectual analysis of evil; but Luther's devil was the concrete embodiment and compendium of evil, the result of his intense *feeling* of evil. Luther's devil, indeed, was not an intellectual conception at all, but a huge, oppressive spiritual conviction such as only a man of marvellously robust temperament could have had the capacity for. Few men could have afforded to keep, as we may say, such a devil as Luther's—an engine, a machine, which required an inordinate amount of fuel. "Life," says Professor Masson, "must be a much more insipid thing than it was then." Certainly Luther's consciousness was a tolerably exciting affair; the nearest analogy to it that we can imagine is that of a commander-in-chief in the thick of a pitched battle. Suppose this to be chronic and lifelong, and we form an idea of Luther's state of mind. Like a general hard pressed, he had his strategic inspirations. "When he could not drive the devil away by uttering sentences of Holy Writ or by prayers, he used to address him thus: 'Devil, if, as you say, Christ's blood, which was shed for my sins, be not sufficient to ensure my salvation, can't you pray for me yourself, devil?' At this the devil invariably fled, *quia est superbus spiritus et non potest ferre contemptum sui?*"

Professor Masson writes particularly well about Milton, whom he has made an object of devoted study, and draws a very handsome portrait of him as he stood on the threshold of manhood. He was what would be called nowadays a very high-toned young man—what even in some circles would be termed a prig. But Milton's priggishness was in the grand style, and it had a magnificent consistency. It is on the pervading *consistency* of his character that Professor Masson dwells, while he attempts to reconcile his austerity, his rigidity, his self-complacency, his want of humor with his possession of supreme poetic genius. Milton records it as a conviction of his early youth that "he who would not be frustrate of his hope to write well hereafter in laudable things ought himself to be a true poem." "A certain niceness of nature," he elsewhere says, "an honest haughtiness and self-esteem either of what I was or what I might be (which let envy call pride), and, lastly, that modesty whereof, though not in the title-page, yet here I may be excused to make some beseeming profession; all these, uniting the supply of their natural aid together, kept me still above those low descents of mind beneath which he must deject and plunge himself that can agree to salable and unlawful prostitutions." "Fancy," Professor Masson comments upon this, "ye to whom the moral frailty of genius is a consolation, or to whom the association of virtue with youth and Cambridge is a jest—fancy Milton, as this passage from his own pen describes him at the age of twenty-three, returning to his father's house from the university, full of its accomplishments and its honors, an auburn-haired youth, beautiful as the Apollo of a northern clime, and that beautiful body the temple of a soul pure and unsoiled. . . . He had made it a matter of conscientious investigation what kind of moral tone and career would best fit a man to be a poet on the one hand, or would be most likely to frustrate his hopes of writing well on the other, and his conclusion, we see, was dead against the 'wild-oats' theory. . . . The nearest poet to Milton, in this respect, since Milton's time has undoubtedly been Wordsworth." As Professor Masson indicates, the danger that the extreme "respectability" of each of these great men might operate as a blight upon their poetic faculty was not averted by the interposition of the sense of humor. We know how little of this faculty they possessed. What made them great was what we have called their consistency—the fact that their seriousness, their solemnity, their "respectability" was on so large and unbroken a scale. They were men of a proud imagination—even when Wordsworth condescended to the poetry of village idiots and little porringers. In the day of Mark Twain there is no harm in being reminded that the absence of drollery may, at a stretch, be compensated by the presence of sublimity. The wild-oats theory, too, may probably be left to take care of itself, and the history of Milton's youthful rigidity be suffered to suggest that there is a fine opening for the next young man of talent who feels within him the spirit to risk something. If, as Milton says, "he would not be frustrate of his hope to write well hereafter in laudable things," he might try the experiment of ignoring trivialities. American readers will probably compare Professor Masson's disquisition on Dryden with that of Professor Lowell, and conclude decidedly in favor of the latter. Professor Masson's essay belongs to a coarser school of criticism, and he points out much less acutely than the American critic's remarkable insight in the poetic mystery enables *him* to do, why it is that in spite of the many accounts against him the balance, on the scroll of fame, has been in Dryden's favor. The present essay is readable, but Professor Lowell's is suggestive.

One may bestow the praise of suggestiveness, however, on the last paper in the volume—an ingenious plea for the *indirect* testimony of past literatures as to contemporaneous refinement and virtue. The accumulation of science, says Professor Masson, not only adds to the stock of what the mind possesses, but modifies the mind in what it is *per se*. Operating on its new acquisitions, the mental apparatus enlarges its functions and, as a greater quantity of grist is brought to the mill, becomes a more powerful machine. This at least is the common assumption, and this would prove that we of the present day are (besides our character as mere trustees of new discoveries) people of a higher intellectual value than our remote precursors. Professor Masson contests the deduction, in a spirit which most disinterested students of history and literature will probably sympathize with. "Shakspere lived and died, we may say, in the prescientific period; he lived and died in the belief of the fixedness of our earth in space and the diurnal whirling round her of the ten spectacular spheres. Not the less was he Shakspere; and none of us dares to say that there is now in the world, or has recently been, a more expert thinking apparatus of its order than his mind was, a spiritual transparency of larger diameter, or vivid with grander gleamings and pulses. Two hundred and fifty years therefore, chockful though they are of new knowledges and discoveries, have not been a single knife-edge of visible advance in the world's power of producing splendid individuals." And the author continues that, adding two hundred and fifty years many times over to that, and receding to the time of the great Greeks, we are obliged to admit that there has not been a knife-edge of advance in the same process since *that* period. Of course it may be claimed that the increase of science has raised the general level of ability—that the number of clever people is greater than formerly. The discussion of this question Prof. Masson waives; he confines himself to "the assertion that within historic time we find what we are obliged to call an intrinsic coequality of *some* minds at various successive points and at long-repeated intervals, and that consequently, if the human race is gradually acquiring a power of producing individuals more able than their ablest predecessors, the rate of its law in this respect is so slow that 2,500 years have not made the advance appreciable. The assertion is limited; it is reconcilable, I think, with the most absolute and extreme doctrine of evolution; but it seems to me both important and curious, inasmuch as it has not yet been sufficiently attended to in any of the phrasings of that doctrine that have been speculatively put forward." Those who are not ashamed to confess to a sneaking conservatism in their valuation of earlier ages than our own, will agree with Prof. Masson that his assertion is important, and they will do so the more frankly if they happen to be particularly struck with the cleverness of the present age. We ourselves find this very striking; the general level of ability seems to us wonderfully high, and we believe that really candid students of literature must often admit that we allow things nowadays to pass unnoticed which would have made the fortune of earlier writers. We not only beat them in knowledge, but we beat them in wit. And yet who does not know what it is to be divided, half painfully, between his sense of these facts and their brilliant and flattering meaning, and his sense, particularly tender as it often is, of the great movements of the human mind being, or at least seeming, great in virtue of a certain essential and unalterable quality? In some such clinging belief as this your genuine conservative finds a mysterious comfort, which it would take him a long time to explain. It would perhaps be, even to persons of a very discreetly and temperately sentimental turn, one of the most chilling and uncomfortable conquests of the doctrine of evolution, that we should have to reflect that the mind of Shakspere was not only different in degree from ours, but different in kind.

## THE GYPSY DIALECT IN ENGLAND.*

THERE is one class of the English community as yet unspoilt by ultra-civilization. We mean the Gypsies. Outcasts though they are, both by their own choice and by the verdict of the world at large, they are, nevertheless, a people by no means wholly void of virtues. The chief peculiarity about them seems to be, that, having wandered for untold generations, an uncontrollable love of vagabondism has become with them a second nature. For the pleasure attending the wild freedom of their existence they see no adequate compensation in the comforts enjoyed by those who have a fixed home. It is a pleasing picture, and yet not colored in excess of reality, that the authors of the book under notice draw of the Gypsy of England. Only want of space forbids our presenting it in full :

"No carpet can please him like the soft green turf, and no curtains compare with the snow-white blossoming hedgerow-thorn. A child of Nature, he loves to repose on the bare breast of the great mother. As the smoke of his evening fire goes up to heaven, and the savory odor of roast 'hotchi-witchi' or of 'canegri' soup salutes his nostrils, he sits, in the deepening twilight, drinking in, with unconscious delight, all the sights and sounds which the country affords. With his keen senses alive to every external impression, he feels that

> 'Tis sweet to see the evening star appear ;
> 'Tis sweet to listen, as the night-winds creep
> From leaf to leaf.'

He dreamily hears the distant bark of the prowling fox, and the melancholy hootings of the wood-owls. He marks the shriek of the 'night-wandering weasel,' and the rustle of the bushes as some startled forest-creature plunges into deeper coverts ; or, perchance, the faint sounds from a sequestered hamlet reach his ears, or the still more remote hum of a great city. Chilled from his infancy in such haunts as these, 'places of nestling green, for poets made,' and surely for Gypsies, too, no wonder if, after the fitful fever of his town life, he sleeps well, with the unforgotten and dearly-loved lullabies of his childhood soothing him to rest."

The genuine Gypsy is readily distinguished by his swarthy complexion, by his gait, and especially by his truly Oriental eye. His eye, above all, bespeaks him a wanderer from somewhere in the East ; and, but for the popular ignorance in past ages of the physical peculiarities of Asiatics, the French, and our forefathers in their track, would never have given him a name significative of origin from Egypt. As to the particular region of the East whence he emigrated, it is now determined, definitively, to be India. No position in ethnico-philology is more incontrovertible than this. When he came out of India is, however, a point not only as yet undecided, but destined probably to remain a mystery for ever. In basis and in bulk his dialect is Hindî, and the Hindî now existent. Whether the rest of it is not as well Hindî, but that of mediæval times, is a question on which we may possibly get some light if the poems of Chand are ever retrieved in their ancient purity. Hundreds of years must have elapsed after the Gypsy bade farewell to the plains of Hindustan before he reached the shores of Great Britain, where he has been known for upwards of three centuries. We have evidence that, in the course of this long period, as he receded from his home, and passed from land to land, his vocabulary was enriched from his contact with the peoples among whom he sojourned. That his mother-tongue was, in the meantime, otherwise modified, is not at all surprising. If it had not been for one consideration, he must, in the natural order of things, have lost it altogether. Choosing to dwell aloof from the rest of humanity, the Gypsies in keeping up their old speech acted from an instinct of policy. Strangers and aliens wherever they showed themselves, their very self-preservation, either collectively or individually, depended largely on their being able to hold converse in a tongue unintelligible to their neighbors. It is, we take it, from their having recognized this fact, and from their having acted in accordance with it, that their dialect still survives.

Observant of strict scientific method, and carefully discriminating what has fallen under their personal observation from that which they report on the authority of others, Messrs. Smart and Crofton restrict themselves almost wholly to the Gypsy dialect as known in England. And herein they have done judiciously. For in no two countries whose indigenous populations use different languages does the dialect of the Gypsies prove to be identical. When we possess monographs on the Gypsy dialects, treated country by country, executed as scrupulously as our authors have executed their monograph on the Gypsy dialect in England, it will be safe, and sooner it will not be safe, to speculate on the speech of our Ishmaelitish cousins in its generality. In the interests of exact knowledge, it is all-important, too, that writers on this subject should employ a uniform scheme of phonic notation. When, as in Dr. Paspati's elaborate 'Études sur les Tchinghianés, ou Bohémiens de l'Empire Ottoman,' we meet with Sanskrit, Hindî, Persian, Turkish, and other words, not to speak of Gypsy words themselves, Romanized after half-a-dozen systems, it is a rare chance that any but a very learned linguist indeed, if he ventures to dissert on what is presented to him, is not constantly betrayed into erroneous conclusions.

As the Gypsy dialect differs in different countries, so it may differ in one and the same country. Thus, in England, there is the ordinary form of it, and there is, also, an older form of it, now fast disappearing. As to idiom, and, most of all, as to verbal collocation, the latter is by far the more interesting of the two, from contributing to remind us more directly, when we consider the dialect in all its features, that, in it, we have to do with a speech of Asiatic extraction. It would be curious to ascertain whether the practitioners of the old dialect retain, as part of it, the Indo-Aryan distinction of two sorts of *r*, the distinction of *d*, *t*, etc., terminally aspirated and unaspirated, and the further distinction of *n*, *d*, *t*, *dh*, and *th* into lingual and dental. In our own intercourse with Gypsies we have noticed none of these niceties, as they seem to us occidentals. In their leisurely stroll through Continental Europe, the postfixed aspirate to which we have referred may have been smoothed away by surrounding influences, though we are not certain that the observation of Gypsyologists has been sufficiently accurate to leave no room for doubt on this head. Further, the letters *d*, *n*, and *t*, where lingual, were, we surmise, first dentalized, so as to conform to their character everywhere on the Continent, and these letters, on reaching England, where there are no vernacular dentals, were, in turn, lingualized. As confirmatory of what we have remarked with regard to the loss of aspirated consonants, we may add that the Gypsies, according to writers on their dialect, have, for instance, the words *bok*, *jib*, *kas*, *lik*, *nok*, *poos*, *rook*, *tan*, meaning hunger,' 'tongue,' 'hay,' 'nit,' 'nose,' 'straw,' 'tree,' 'place' ; and that the corresponding Hindî terms, *bhûkh*, *jibh*, *ghâs*, *likh*, *nâkh*, *phûs*, *rûkh*, *thân*, show, every one of them, aspiration. Oddly enough, however, the Gypsies cleave, in some cases, to the Semitic guttural equivalent to *x*, as in their *boxt*, "fortune," from the Persian *bakht*.

So little, very frequently, do Hindî words vary from their Gypsy counterparts, that, if pronounced by a Hindu, they could not fail of being understood by an English Stanley or Herne. To name a few of the most striking, such are *bahut*, *bâl*, *châm*, *chhurî*, *chûmâ*, *ḍorî*, *dosh*, *gon*, *kân*, *kaun*, *lâj*, *lon*, *mâns*, *manush*, *muṇh*, *naṅgâ*, *pânî*, *rât*, *sânp*, *sing*, *tale*, signifying 'much,' 'hair,' 'skin,' 'knife,' 'kiss,' 'string,' 'fault,' 'sack,' 'ear,' 'who?' 'shame,' 'salt,' 'flesh,' 'man,' 'mouth,' 'naked,' 'water,' 'night,' 'snake,' 'horn,' 'under.' The Hindî *kâlâpan*, 'blackness,' has become, among the English Gypsies, *kaulopen*, for which the Turkish Gypsies have *kalipe*. As between *-pen* and *-pe*, it is hasty in our authors, following Dr. Paspati, to consider the former as the older. The Dravidian originals of both, namely, *-pan* and *-pâ*—*-panâ* having been left unrepresented—came, almost unaltered, all the way from India. In *rattvalo*, 'bloody,' we seem to see a corruption of *raktwâlâ;* and, in *trooshloo*—or *trushalo*, as the Gypsies have it in Turkey—a corruption of *trishâlu*, which, though not in the dictionaries, is perfectly good Sanskrit and Hindî.

That the Gypsies took Persia on their way from India, or passed very near it, there are few, if any, clear indications in their dialect as now preserved in England. Such Persian words as *pashm* and *poshîda*, whence their *pooshom* and *posado*, 'wool' and 'hidden,' with many others which might be specified, have long been naturalized in India ; and the Gypsy *besh*, 'sit,' may more reasonably be referred to the Hindî *basnâ* than to the Persian *bishistan*. However, *hefta*, 'seven,' the Persian for which is *haft*, is asserted to be used, in some localities, by the Gypsies of England. On the poverty of their lexical capital, as compared with that of their Continental kinsmen, and on their almost total loss of inflections, still very numerous elsewhere, we cannot stop to dwell. For all this, like the old Arabs of the Desert, they pique themselves on their lingual legitimacy, and sturdily resist any innovations which palpably contravene established analogies. A Gypsy ventures a vocable of his own coining. "His comrades sit in judgment on the production, and, after a critical examination, 'welcome the little stranger,' and commend it as 'a good lav,' or crush it in its birth, and pronounce it to be 'not tatcho,' if it does not come up to average excellence." So say our authors ; and they ought to know.

The Gypsy prohibitive particle *maa* there seems to be as little ground for taking from the Persian *ma* as from the Greek *μή*. *Mâ* is pure Sanskrit, and is at once suggested by the Hindî *mat*. When *mat* was developed is unknown ; but *mâ*, now long obsolete, appears to have been in the vigor of life when the Gypsies left their ancestral abode. And so, we apprehend, was the Sanskritic locative case—which, by the way, our authors strangely call the "second dative"—at present well-nigh extinct. *Tire*, 'on the

* 'The Dialect of the English Gypsies. By B. C. Smart, M.D., and H. T. Crofton. Second Edition, revised and greatly enlarged.' London : Asher & Co. 1875.

shore,' is the sole univerbal locative (sundry postpositions excepted) that we ever heard in India: the lexicographers, a lazy folk, have overpassed it. Now, the Gypsies have *ker*, 'house,' and *kere*, 'at home'; *ghar*, in the Hindî of our time, and *ghare*, very probably, in the Hindî of bygone ages.

The dialect of the English Gypsies is made up of most miscellaneous constituents. Its *Anghiterra* and *Londeri*, for 'England' and 'London,' are of too unmistakable source to call for comment. *Fon*, the German *von*, is 'from'; and *stifo-*, as in *stifo-dad*, 'father-in-law,' is the German *stief-*. *Tood*, 'milk,' the Hindî *dûdh*, also intimates German influence. *Sapin*, 'soap,' ultimately traceable to the Greek σάπων, may have been picked up in any of half a score of Asiatic and European regions. *Chairus*, 'time,' is thought, by Dr. Paspati, to be from καιρός. *Quien sabe?*

*Dwâr*, 'door,' the Gypsies have changed into *wooder; ghâm*, 'sunshine,' into *kam*, 'sun'; *hast*, 'hand,' into *vast; him*, 'snow,' into *shiv* and *yiv; khânâ*, 'eat,' into *haw*. The processes, none of them unprecedented, involved in these transformations, we must abstain from detailing. Nor have we room to do more than barely touch on the Gypsy digammas, as we may designate them. These are seen in *vangar*, 'ember,' from *angâr; waver*, 'other,' from *aur; yog*, 'fire,' from *âg;* and *yok*, 'eye,' from *ânkh*. With *yog* and *yok* compare our ancestors' *yer*, for *ere*, which occurs even in the first edition of our ordinary Bible, King James's.

Messrs. Smart and Crofton offer us, in their volume, after a pleasantly written Introduction, a Grammar, Vocabularies Gypsy-English and English-Gypsy, and a very interesting collection of genuine Romany compositions. Dr. Smart, in the first edition of the work, entered into rather full particulars touching etymology. We hope that, in the third edition, the authors, with the assistance of some sound Oriental scholar, will assign to this department of their subject the attention which is its due, and thus double the value of their meritorious researches.

## SAINTE-BEUVE'S FIRST ARTICLES.*

THE acutest critic the world has seen spent much of the latter part of his life in revising his published writings, amending them, minutely annotating, and generally re-editing them. Everything that had ever come from his pen retained his interest to the last, and he thought that anything that was worth doing at all was worth doing well. He had a passion for exactitude, and he wished, as it were, to make a certain toilet for his productions, on their appearance before posterity. This is the sentiment of a man who feels that he has done good work; it is only solid objects that will bear free handling, and Sainte-Beuve had a comfortable sense that in his essays and *causeries* there was no want of pegs to hang notes and appendices upon. He prepared, therefore, during his last years, a series of "authorized editions" of all his principal performances—beginning with the later and proceeding back to the earlier ones. The editor of the present volume quotes from him a passage in which he expresses his general theory on these undertakings:

"I save what I can of the damaged baggage; I wish that what I reject might perish wholly and leave no trace. Unfortunately, this cannot absolutely be; what one collects into stout volumes is not saved by that fact, and what remains in scattered sheets is not so completely lost that it does not drag in one's track and weigh down, if need be, one's literary march and, later, one's memory (if a memory there is to be), with a multitude of confused and straggling reminiscences. It is proper, then, to answer only for what one has admitted, and, without disavowing the rest, to send it to the bottom. In a word, if one has a care for the future; if, without having the vanity of believing in anything in the way of glory, one feels at least the lawful desire to be in some rank or other an honorable witness to one's time, one has all precautions to take: one cannot too much act as a ship (*faire navire*), and keep one's course straight, to pass, without foundering, the perilous straits."

Sainte-Beuve republished his early poems and his youthful novel 'Volupté,' but he did not live to collect his first critical articles, his groping experiments in the line in which he subsequently became a master. It is a vast pity that, since they were to be exhumed, he himself should not have presided at the ceremony. He would have supplied them with a number of entertaining notes, and given many valuable glimpses of the history of the formation of his opinions. It is a strange and uncomfortable thing to find one's self reading Sainte-Beuve uncommented by himself; the absence of the familiar footnotes, generally more characteristic and pointed than the text itself, has something melancholy and almost cruel; it reminds one afresh of his departure, and is like seeing a person thrust half-dressed into company. The present volume has been put together by one of his literary executors, and the work has apparently been carefully done, as far as the searching out and identification of his pieces are concerned. Sainte-Beuve had, after much solicitation, announced his intention of doing this work himself; they seem to come under the head of those things which would not go to the bottom, even if one threw them overboard. They were contributed to the *Globe* newspaper during a series of years beginning with 1824, when the author was a half-hearted medical student of twenty. The title of 'Lundis' is of course a device of the publisher, but the subjects are the same in character as those he treated later—literary figures of the day, and of the seventeenth and eighteenth centuries.

It is interesting to observe his first trustful impressions of writers on whom he subsequently expatiated with such ripe sagacity and, in some cases, with such polished irony. This especially strikes us in reading his youthfully glowing tribute to the early poetry of Victor Hugo and Lamartine. As to Victor Hugo indeed, as years advanced, Sainte-Beuve maintained a portentous silence; he let him alone, as he let alone Madame Sand and Balzac (to the latter of whom he never did justice), and when he withheld an opinion one might know there was a good reason for it. But Lamartine, on various occasions, he handled with unsparing acerbity; the poet had relaxed and the critic had hardened. The merit of these papers is evidently greater than was to be expected; they seem to us to contain the distinct promise of the author's future. There are things excellently said throughout, and which would be worth quoting; but the main thing is the general manner, the general firmness, the certainty and maturity of touch. The author writes as if he felt that, without abrupt transitions, he was going to become a master; if we had been his editor we should certainly have kept an eye on him. The article on the Memoirs of Madame de Genlis is, for a young man of twenty-two, extremely remarkable, and if he does not yet speak with the authority with which, many years after, he alluded to the lady's being *de veine verbeuse et mensongère*, there is no lack of a really penetrating perception of her foibles. The talent for incisive irony is apparent from the first. "At Modena, the Prime Minister, M. de Lascaris, threw himself at her feet, with a little air of triumph which she contrived very well to repress. At Rome, she saw the Cardinal de Bernis, whom they called there the King of Rome. . . . He assisted regularly at the baths of Madame de Genlis, and enlivened them by his charming conversation. The Chevalier de Bernis, his nephew, was her guide in her nocturnal promenades among the ruins of the Coliseum, but 'he was at least fifty years old.' At Naples, she ravished the whole court by the sound of her harp—and the queen especially, who kissed her hands; she saw also some lazzaroni, all naked, and some superb figs and pine-apples—and there ends the journey in Italy." These lines, from a charming paper on Diderot, of the date of 1830, might have been written at the close of the author's life; they have quite his final tone and rhythm: "That Diderot should grow fat, that his paunch should define itself, that he should have indigestion and take medicine, that Mlle. Voland herself should 'pay a bad fortnight for a little glass of wine and the thigh of a partridge too much,' this shocks us, in turn, for a long time, and spoils for us many effusions still living, many fresh reminiscences of love. For noble, ideal love, as for poetry, there are but two periods of life, youth and old age; in the interval, when profound and passionate love exists, it must hide itself and beware of witnesses; it does not easily interest a third person; it is complicated with a thousand petty miseries of body and mind, with obesity, with ambition; one can hardly believe in it, one can't admire it." These reflections savor of the wisdom that comes of much observation of the world, and, if anything might have qualified our confidence in the wisdom of the shrewd young critic, it would have been the suspicion that he was *too* shrewd, too old, too *posé;* that his taste was too good. Youthful genius is, traditionally at least, a trifle more erratic.

English readers will glance with especial interest at the articles on Scott's 'Life of Napoleon' and on Fenimore Cooper. The former is remarkable for its very delicate and sympathetic discrimination between Scott's charm as a romancer and his culpable weaknesses as a historian. For a young Frenchman of 1827 to declare so eloquently that he esteemed the author of 'The Bride of Lammermoor,' *as such*, none the less for having compiled that melancholy work, 'The Life of Napoleon,' indicates a striking measure of critical generosity. But young Frenchmen of that period took romancers on easy terms if we may judge by the extreme friendliness of the author's remarks on 'Le Corsaire Rouge'—that fast friend of our school-days, 'The Red Rover.' Cooper's magnificent popularity in France has always seemed to us a half-amusing, half-touching spectacle, and there could be no better proof that people, in judging a foreigner, should never be sure they have not made a mistake in *proportion*. The "cultivated American" at the present day has an old-time fondness for Cooper, which makes the smile in which he indulges on finding that there are people who still read him a very kindly smile; but though we

* 'Premiers Lundis. Par C. A. Sainte-Beuve, de l'Académie Française.' Tome I. Paris: Michel Lévy; New York: F. W. Christern. 1874.

have a healthy disposition to make the most of our literary luminaries, we are not commonly addicted to speaking of the author of the 'Last of the Mohicans' as a first-rate man, and we are puzzled on finding ardent allusions to him in such writers as Balzac and Madame Sand. But, of course, if we take his trappers and his Indians in good faith, Europeans could hardly do less, and the prairie and the virgin forest, as he portrayed them, had, when contemplated from the Boulevard, a prodigiously natural air. We are inclined to believe, however, that Sainte-Beuve made, first and last, almost no other mistake than this, and these slight papers give us, as we have hinted, an impression of almost formidable sagacity. We confess that, touching such a man as Sainte-Beuve, our curiosity is infinite; we feel as if we could never learn enough about him. His intellectual fecundity was so unbounded that one imagines that the history of his individual opinions would throw a preternaturally brilliant light upon the laws of the human mind at large. We are thankful to learn from his present editor that such a history is to receive a valuable contribution in the publication of his letters, as completely as possible. We had a couple of years since a taste of his epistolary faculty in his published notes to the Princess Mathilde. These were not elaborate letters; they were emphatically notes—notes on life, on people, on books—but they had a point, an acuteness, a savor which make one eager for the sequel. They will set the seal of completeness on a truly magnificent literary record. We may add that there is apparently to be another volume of these 'Nouveaux Lundis,' and that there is much so-called "ripe criticism" at the present hour which has less flavor than these verdant first-fruits of a man of extraordinary genius. The grasp may here and there lack firmness, but the hand is already the hand of a master.

---

*Masterpieces in English Literature*, and Lessons in the English Language, etc., etc. Designed for use in Colleges and Schools. By Homer B. Sprague, Principal of the Adelphi Academy, Brooklyn, N. Y., and late Professor of Rhetoric in Cornell University. In Four Books. Vol. I. (New York: J. W. Schermerhorn & Co. 1874. 8vo, pp. 437.)—Prof. Sprague's book is not on a level with the high standard to which English philological and literary study has been raised of late years by English, German, and American scholars; it falls, indeed, far below it, though it is characterized by unusual pretension—by large promises, along with a small performance. The selections are excellent; and, with one exception, all complete works, comprising the 'Clerk's Tale of Patient Griselda,' from the Canterbury Tales; Spenser's 'Epithalamium,' Six of Lord Bacon's Essays, Shakspere's 'Macbeth,' Milton's 'Areopagitica,' 'Ode on the Nativity,' and 'Comus,' and Bunyan's 'Pilgrim's Progress,' Part I. In the Preface, the editor says:

"In the following work, constituting the first series, and, indeed, in each of the subsequent volumes, the object is primarily and chiefly to present for study the masterpieces in English literature; but incidentally the attempt is made to show, in the first two volumes, something of the philosophy and development of the English language, and to awaken an interest in its critical study."

Now, to show the development of the English language, and to awaken an interest in its critical study, we need not say that that development and that critical study can be, the one exhibited and the other pursued, only on the basis of the forms of the language at different periods of its history. But turning to the editor's introductory remarks to the 'Clerk's Tale,' on page 18, we read:

"Except in the last six stanzas [L'Envoye de Chaucer] I have taken the liberty to modernize the spelling wherever it would not change the pronunciation of the word, outlandish orthography being no more essential to old English poetry than to modern wit."

In other words, he thinks with Artemus Ward that "Mr. C. had talent, but he couldn't spel." He says, as quoted above, "*incidentally* the attempt is made," etc. But, in turning over the book, we find that the "attempt," instead of being "incidentally made," constitutes a very prominent feature of the performance, more prominent even than in many text-books that might be named, in which the development of the language and its critical study are a *leading* object. We don't make that, of course, a ground of objection. But the editor's idea of what constitutes a critical study of the language, as shown by his treatment of Chaucer, philologically the most important author in his book, whose "outlandish orthography" he considers "no more essential to old English poetry than to modern wit," is open to considerable objection. What a teacher who would impart instruction to his class on the forms of Chaucer's language could do with such a text as the editor has served up is a question, unless he should employ it as grammarians employ false syntax sometimes, to teach correct grammar. It represents neither the English of the fourteenth nor of the nineteenth century, nor any other English that has ever existed since the foundations of the world were laid; at any rate, since the Norman Conquest.

Our author's treatment of Shakspere is characterized not only by his usual pretentiousness, but by a flippancy as out of place as it is intolerable. "I recognize," he says, "in Shakspere, as in most men of the highest genius, a singular force and intensity." "More than any other writer, he loads words with meaning till they sink under the weight; vivifies nouns into verbs; *injects his fiery emotion, incapable of cooling, through the rifts of granitic thought;* vitalizes and incarnates the shadows of fiction, till no historic characters seem so real." But there are pitiable offsets to every human life, however exalted, and the Professor stays his thunder in mid volley, and interposes one of these offsets: "Yet one blunder, great and almost fatal, stands out in bold relief. At eighteen, having no visible means of supporting a family, he marries Anne Hathaway, a woman of twenty-six. Before he is twenty-one, *three little Shaksperes are crying for bread!*" He alludes to the tradition that Shakspere was once a schoolmaster, and thinks that of this "some confirmation may be found in the prominence which Shakspere gives to school exercises, and in the *marvellous fluency* with which he uses those words and illustrations which are the stock in trade of Latin schoolmasters." He then adds: "But the hum of pedagogy by day, or the monotony of hard study by night in a room *where three babes exercise their musical prerogatives unquestioned*, is dull experience for a youth conscious of gigantic powers, and determined to scale the highest heaven of thought." Alluding to the story of the deer-poaching, he says, "Caught in the act, William and his young fellow-poachers *show fight*." Of the poet's vocabulary, he says: "*His extraordinary vocabulary, far surpassing in fulness and accuracy that of any other writer in any age*, proves him to have been a most diligent student of language." Among other subjects given on page 179, the student is directed to write an essay upon "Shakspere's vocabulary, and what is proved by its fulness and accuracy." Now every Shakspere scholar knows that while Shakspere was perhaps the greatest *expresser* that ever lived, he used a comparatively limited vocabulary. The power of his diction consists not in the abundance of his words, but in the way he marshals those he uses, so that they often mutually stimulate each other to the fullest realization of their potential expressiveness. Mr. George P. Marsh, an accepted authority, has estimated that Shakspere's entire vocabulary little exceeds fifteen thousand words, and of these a large number, chiefly of Latin origin, will be found to occur but once or at most twice in his pages, while the authorized vocabulary of the time embraced twice or thrice that number. The laborious translator, Philemon Holland, who was born twelve years before Shakspere and survived him twenty, "being himself translated," as the humorous Fuller in his 'Church Worthies' expresses it, in 1636, used in his translations a very much (easily more than fifty per cent.) larger vocabulary than did Shakspere, and a vocabulary, too, which was in general use at the time, as we know from other contemporary writers.

Professor Sprague, after summing up the "points of his intellectual supremacy" which he "recognizes," concludes:

"Yet Shakspere was but half a man, rarely looking beyond the uses of the theatre. Prince of dramatists, master of the revels to all mankind, chief caterer to human amusement—this is something; it is even noble. But it is not enough. Great intellectual, moral, and political movements are in progress in England and on the Continent during the whole of his career. Shall not the most consummate of artists play the man? Shall the foremost intellect of the race be insignificant in action and loose in conduct? see nothing but from the standpoint of his theatre? say nothing but as an actor on the stage? do nothing to lead the struggling millions to a higher life? But let us not judge hastily. We may be pardoned for the perhaps excessive charity of believing that, if his days had been prolonged, he would have atoned for the indifference or idleness of the past. Cut off suddenly at the age of fifty-two, what plans for human improvement may not have been buried with him? Given thirty years more, he might have shown himself as sublime in action as in thought. We have here his own explicit declaration that the life of a trifler was distasteful to him." (He here quotes portions of the 110th and 111th Sonnets.)

Talk like this from a "Professor of Rhetoric" in a university, or even from a principal of an academy, is out of reach of comment. The book, coming from either source, may fairly be called scandalous.

---

*Tales in Political Economy.* By Millicent Garrett Fawcett. (New York: Macmillan & Co.)—Mrs. Fawcett, who, it is hardly necessary to say, is the wife and coadjutor of the well-known professor of that name, attempts in the little volume before us to make plain some of the elementary principles of political economy by three or four stories told by an old sailor, Captain Adams, who had travelled far and passed much time on an island in the Southern seas with a company of shipwrecked sailors, whose doings lay bare the processes of production and distribution in their

simplest forms. The first tells how the chiefs of a settlement composed of the descendants of Dutch settlers in an island in the Indian Ocean, having groves of palm-trees of their own, from which they produced great quantities of oil—the monopoly of which they retained for themselves—provided a market for the oil by compelling the commoners to build their huts without windows and keep a mat hanging down in front of the door, so as to keep the interior in perpetual darkness, and how Captain Adams failed in trying to induce them to give up the manufacture of oil and use the sunlight in its stead, and devote themselves to the preparation of other commodities for exchange. This is exceedingly pat and well told. The others, relating to the lives of the shipwrecked sailors, having to illustrate such complicated matters as the division of labor, exchange, demand and supply, the elements of value, the nature and use of money and of credit, are less successful, as the narrative constantly, and we were going to say inevitably, runs into simple exposition. We consequently feel that if a pupil needed the story he would not profit by the exposition, and that if he could profit by the exposition he would not need the story. Political economy undoubtedly admits, more than most other branches of knowledge, of being illustrated in this way, but we doubt if any story ought to attempt to deal with more than one point. The struggles of a producer, for instance, with a currency varying from day to day in value, would make a good parable in itself if no other element were let in; but as the problem becomes complex, the difficulty of covering it with fiction is enormously increased, even in the hands of so skilful a writer as Mrs. Fawcett. By all of which we do not mean to say, by any means, that she has not made a useful book in the present case.

# Fine Arts.

## THE WATER-COLOR SOCIETY'S EXHIBITION.—II.

THE death of Mr. Burling and that of Mr. Eaton, the former the Society's founder and long its secretary, have cast an unusual gloom over the exhibition at the Academy. Mr. Burling, now taken away in his youth, was a companionable, lovable man, fond of woods, fields, and art, and a born companion of the birds, whose pretty ways and movements he captured in a great many beautiful and accurate studies. His sense of landscape beauty, too, was acute and tender, and he excelled in a peculiar Meissonier-like way of dotting figures into scenery with a lifelike confusion of detail. His contributions to the display this year are at the level of his best works heretofore, and indicate a painter hardly in his prime, certainly not beyond it. Mr. Eaton, too, leaves a host of regretful friends.

The largest figure-piece contributed, we believe, and in some respects the most important, is Mr. Frederick's group of "Romeo and Juliet." This artist has some right to grapple with Shakspere, as proved by his very imaginative illustrations to the "Midsummer-Night's Dream," and by a large meritorious oil-painting of the "Death of Tybalt," exhibited some years ago. The present contribution, though not the best that Mr. Fredericks is capable of making for us, has study and sentiment. Juliet, a little pleading nightgowned child, is at least pathetic, if not strictly tragical. The Romeo, in a costume that cuts him up into too many tessellated squares, is not quite satisfactory, as his pose looks huddled and his figure somewhat flat and disarticulated; but his grave, almost Dantesque aquiline profile, in the cowl of an antique travelling-cloak, suggests great depth of character and capacity for suffering. The style of the work is that of one who does not move easily in the methods of water-color; it is a tinted drawing and no painting. The severe outlines intersect the whole composition, and are not always so pure and sensitive as they ought to be. The color, in a minor key throughout, is agreeable and unobtrusive.

A contrasting exhibition of very cheap sentiment is made by Mr. Matt Morgan in a showy and superficial pair of emigrants, looking homeward over the side of the conventional vessel in the conventional way. One seems to see in the handsome ease with which he works that Mr. Morgan has no care or thought for what his heroes are feeling, but puts in the lines of expression according to formula, with all the happiness of a routine one has thoroughly mastered. If there be any form of life, pain or pleasure, dignity or vulgarity, with which this artist really sympathizes, we are convinced he would paint a fine picture of it. Up to this moment, as is well known, his grand successes have been the skeletons of the *Tomahawk*. The present picture appears to be in pure gouache, and is executed with workmanlike and even reckless facility. Mrs. Elizabeth Murray shows, we fancy, improvement in her large picture of a girl twisting a ribbon in her hair, called "The White Rose"; though the eye of this heroine is rather wider than her mouth, a phenomenon of scale not observed in nature, yet the expression is pure and genuine, and the requisite effect of lily-like purity is not marred by anything in the expression or the attitude. Mrs. Murray's study of Gypsies is even less coherent than is the wont of that threadbare and long-suffering tribe when it falls into her hands. Mr. William Magrath, whose recent pictures have given so much real pleasure, shows in his "Wilds of Connemara" that he can play the pastoral reed without imitating Mr. Boughton or any other Lycidas. The distance here has an energetic charge of coloration, and the hoyden-shepherdess a piquancy of character that Mr. Boughton would rather fall into paralysis, we suspect, than represent. Yet the scene is a pastoral and an idyl, for all its individuality; the girl looms against the sky like some wild growth that has never been taught how poetic it is, and the wrinkled coats of the sheep, breaking into matted fissures as the animals twist their lean necks among the herbage, are true to nature and therefore faithful to sentiment. Mr. Winslow Homer, with rapid ease and photographic breadth, plants his flattened figures against a great variety of landscapes and coast-reaches. He contributes very copiously, and it is hard to say which of his sketches is the best when none are bad. Perhaps that of two smug and innocent fisher-boys, conveying a basket of clams, and just unconsciously swerving from the path at sight of a strange fish lying on the sand, is as characteristic as any. The pleasure with which we recognize truth-evidence in every study of Mr. Homer's is, however, marred by a really poignant feeling of regret. Seven or eight years ago this artist seemed to be preparing to paint pictures, and not mere effects; at present his highest exercise is to lay silhouettes of pasteboard on a ground of pasteboard differently tinted, and with these admirably-cut jumping-jacks to go through the various evolutions of life as given "in the flat."

The large and remarkable pictures by Mrs Stillman are almost the only examples present this year of that intellectual subtlety in figure-treatment and that Northern or Gothic ballad-pathos which mark the British school. These qualities are conferred by education, if not by residence, upon the artist in question, whose treatment of Arthurian legend is so poetic and so grave. In one composition, Launcelot is discovered by Elaine, as he dreams by a fountain in his fool's dress, his bauble lying beside him, and the "pleached bower" of a rose-garden woven above his head; in another, Isoud stands white and ghost-like before Tristram, a lily planted beside her figure, like the symbol of a saint. The pictures are marked by a very perfect observance of unity, the mediæval slenderness of the forms going well with the fashion of the pleasance and the orchard in the respective scenes, the quaint formality in which reminds one of missal-work. Deep, pure, and transparent colors are embroidered over the intricate compositions, and fit the drawing like primitive music accompanying antique words. Whatever has been seen of this artist's work is marked by thought and intellectual beauty; her treatment of portraiture, as in the large female head on exhibition, is fascinating in its intensity of comprehension and reserved power; in the painting of details, as in the Chinese vase of a flower-study close by, the work is the direct and innocent copy-work of ancient illuminators. One may believe in very different theories of art, yet be unable to resist the charm of a sectarianism so consistent, sacred, and sincere.

A Gavarni-like subject by Gustave David, with a girl and carrier-doves, and the cluster of half-a-dozen carefully finished family groups by Eugène Devéria, remind one of the vast emancipatory strides made by French water-color in the present age of Vibert and Bida. The Devérias, with the Greuze-like family sentiment, the Isabey-like finish, and the Louis Philippe costumes, are interesting rather historically than intrinsically. The burst of warm Venetian color which was shown in his Luxembourg picture of "The Birth of Henri IV." subsided soon into commonplace, and the artist died young. The broad and manly style in which French water-colorists now paint the figure is a foreign lesson, yet is derived less from their English predecessors than from certain Spanish and Neapolitan influences. The Spanish-Italian school is represented in the Society's exhibition by some choice examples, among which that of Villegas looms like a tower above the rest. We allude to these, not for the purpose of expatiating upon them at present, but to indicate how interesting a study may be made of painting according to its historic dates, and also to point out the class of art which the more earnest American painters are selecting for standards and criterions.

Kappes and Knight contribute figure-subjects of much graphic merit, yet such as could never have been painted or taught by an English aquarellist. The organ-grinder feeding his monkey, and the beggar-man, by Mr. Kappes, are in a large, flattened style, relieved in plane surfaces, the body-color applied as with a trowel, and the whole treatment seemingly derived from scene-painting in distemper; yet the touch is as different as possible

from Mr. Morgan's, with his English hatching and quilting. Mr. Knight paints similar character-subjects with a similar breadth, but with transparent washes of color; his gardener and fishermen are energetic and alive. The most admirable figure-studies, however, for pure natural force and virility, are those of Mr. Eakins, in which the method of Gérôme is applied to subjects the antipodes of those affected by the French realist. Mr. Eakins shows three sheets, one representing racing-boats drifting in a calm, one a negro crouched in the grass and decoying plover by imitating their cry, and one a pair of base-ball players. The selection of the themes in itself shows artistic insight, for American sporting-life is the most Olympian, beautiful, and genuine side of its civilization from the plastic point of view; and the treatment, though a little stiff and labored, is pre-eminently sincere. The negro's face is modelled like a bronze, within the size of one's thumb-nail; the business of the scene, in all three of the pictures, is attended to with the religious fidelity which a Greek sculptor would show in a commemorative athletic statue; and the forms of the youthful ball-players, indeed, exceed most Greek work we know of in their particular aim of expressing alert strength in a moment of tension.

The attention of all readers of books of travel is invited to

*AFRICA:*

The History of Exploration and Adventure, as given in the Leading Authorities from Herodotus to Livingstone. By C. H. Jones. With Map and numerous Illustrations. 8vo, $5.

"This volume contains the quintessence of a whole library. . . . What makes it peculiarly valuable is its combination of so much material which is inaccessible to the general reader, who is put in possession, by this means, of a vast amount of entertaining as well as instructive information. The excellent map, showing the routes of the leading explorers, and the numerous illustrations, increase the value and interest of the book."—*Boston Globe.*

"As a survey of the whole subject of African travel and exploration, the book is invaluable, and as such we commend it to all such as desire to become better acquainted with one of the most interesting themes of the age."—*New Haven Palladium.*

*A PASSIONATE PILGRIM,* and Other Tales. By Henry James, Jr. $2.

The volume contains six stories, namely: 'A Passionate Pilgrim,' 'The Last of the Valerii,' 'Eugene Pickering,' 'The Madonna of the Future,' 'The Romance of Certain Old Clothes,' 'Madame de Mauves.' These tales comprise some of the most clever studies in character I have seen anywhere. They are full of fresh description, of that vein of half philosophy, half speculation, which is so taking just now; and the plots are eminently original and unhackneyed. —*New York Tribune.*

*PARNASSUS.* Edited by R. W. Emerson. Revised edition. $4.

READY SATURDAY.

"MARK TWAIN"

Has a very amusing account in it of OLD TIMES ON THE MISSISSIPPI.

DAVID A. WELLS

Has an important paper, TAXATION WITHOUT JURISDICTION UNCONSTITUTIONAL, which every one should read.

W. J. HOPPIN

Gives a striking account of HISTORICAL PORTRAITS LATELY EXHIBITED IN PARIS.

JOHN JAMES PIATT

Treats of the remarkable poet, FORCEYTHE WILSON, who excited so much interest a few years since.

ORIGIN OF THE NAME AMERICA

Is a curious paper, by an eminent geographer, which will attract a great deal of attention. There are seventeen papers and poems and stories in this interesting number, besides the able editorial departments.

Terms: 35 cents a number, $4 a year, postage free.

H. O. HOUGHTON & COMPANY, Boston;
HURD & HOUGHTON, New York.

*PUBLIC HEALTH.* Reports and Papers presented at the Meetings of the American Public Health Association in the year 1874. In one volume 8vo, illustrated with maps and drawings, cloth, $6 50. A few copies only remaining.

This important work contains the result of investigations and observations by eminent physicians and students in sanitary science.

The volume is edited by Dr. Elisha Harris, Secretary of the Association, and among the contributors may be mentioned the President, Dr. Stephen Smith; the Secretary, Prof. Francis A. Walker; Superintendent of the Census, Dr. Nathan Allen of Lowell, President F. A. P. Barnard, Dr. Clendenin of Cincinnati, Dr. Hough of Philadelphia, Hon. A. D. White, President of Cornell University; Prof. Chandler, Dr. Ely McClellan, Dr. J. C. Peters, Prof. Austin Flint. The bulk of the edition has been subscribed for in advance, but a few copies may be had by non-subscribers at the above rate.

HURD & HOUGHTON, 13 Astor Place, New York;
The Riverside Press, Cambridge.

*NEW YORK, THURSDAY, FEBRUARY 25, 1875.*

## The Week.

THE Louisiana Committee has made its report, and Messrs. Hoar, Frye, and Wheeler conclude: That the last election was unfair, and that the colored voters and white Republicans were intimidated; that the White League does exist, and fills the colored people with terror; that more than 2,500 Republicans "must have been prevented from registration or driven by terror from the polls"; that Kellogg was elected in 1872; and that the late returns of the Returning Board were illegal. The majority report, however, which, of course, is the report of the committee, is substantially the same as that of the sub-committee, made a few weeks since. It is signed by Messrs. Foster, Phelps, Potter, and Marshall. They say that "the assumption of the minority that enough colored voters must have been prevented from voting at the late election, by the recollection of the Colfax and Coushatta killing," and by "other riots which occurred years before," to have changed the result of the election throughout the State, is, in the absence of all evidence except that both these intimidated parishes elected this year a full Kellogg ticket by increased Republican majorities, a pretty violent assumption. They declare, on the other hand, that the Conservatives specified with proof 5,200 cases of "conceded false registration in New Orleans alone," and that the registration of colored voters exceeded by 4,000 the total number of colored adult males given by the census of 1870, 86,913, while the white registry was "ten thousand less"; that in only three parishes did the Republican Supervisors of Registration make any complaint of unfair or insufficient registration, and that there is an "entire want of any direct evidence to show any general intimidation of the colored voters," and that "such intimidation as did exist in the State was rather in the interest of the Republicans than of the Conservatives"; and finally, that the election was fair, and the House of Representatives carried by the Conservatives. The whole committee recommend the Louisiana House to reseat the members expelled by the troops; and Messrs. Hoar, Frye, and Wheeler recommend that Kellogg be recognized, while Messrs. Phelps and Foster are of the opinion that a compromise, based on this recognition, might be "on the whole less intolerable than the present situation"; Messrs. Potter and Marshall utterly oppose any recognition of Kellogg. The Conservatives have sent a committee to Washington, which has had an interview with the President. He referred them to Mr. Wheeler, of the Congressional Committee, as a gentleman of the highest character, and of what elderly statesmen call "approved sagacity," and as well fitted to get up a government for them as anybody he knew.

---

The Senate Judiciary Committee were in December directed by the Senate to examine the "Press Gag-law," and particularly to report whether under it persons accused of libel or any other crime could be dragged from their homes to Washington to be tried by a District Court. They have now reported that the gag-law, so called, confers upon the District Courts the power to arrest offenders found in the District who are charged with crime committed in the District and hold them for trial (which was the law before), and to arrest offenders found in the District who have committed crimes against the United States in some judicial district of the United States, and to send them to such district for trial. This, the committee say, "is all." "No person can be brought into the District of Columbia under it, either for libel or any other crime." "It is equally plain that no person charged with the crime of libel in any other district or place in the United States can be arrested here" (in Washington) "and sent to such district or place under it," for *first*, libel is not a crime against the laws of the United States, and, *second*, if libel is a crime by any Territorial laws (and if such laws could be held for such purposes to be laws of the United States), still the Act does not apply to the Territories at all. The committee finally report that the Act is "necessary and proper, and in perfect accordance with the principles of justice and the course of civilized jurisprudence." The report is signed by all the committee, including Mr. Thurman, and may therefore be taken as an authoritative settlement of the press-gag question, notwithstanding that Mr. Lyman Tremain reports himself as still unconvinced.

---

We have before now explained in the *Nation* that we adopted this view of the law—substantially that given unofficially some months since by Senator Frelinghuysen. We suppose there can be no doubt that it is a harmless act, but the "howl and clamor of the press" about it for the last year is rather a remarkable proof of the public odium into which Congress manages to bring its most harmless measures by the reckless manner in which it puts forward the worst men of the country as its representatives and leaders. If this District of Columbia law had been introduced into Congress as a harmless piece of "civilized jurisprudence," nothing more would probably have been heard of it; but it was, on the contrary, passed in the midst of a bitter and furious attack on the press by such men as Senator Carpenter, when the chairman of the House Judiciary happened to be, as now, a notoriously corrupt person who had an especial and avowed hostility to the press. It was passed, too, at a time when the exposure of the frauds of Shepherd, the Washington "boss," had made the press peculiarly obnoxious to all the corrupt leaders in Washington, and it was well known that a law of some sort to muzzle the press had been introduced into Congress by them. When, therefore, the present Act made its appearance it can hardly be wondered at that it was popularly supposed to be directed at the press; nor can we sympathize with the virtuous indignation of the party over the unfair use made of it by the Democrats. The people engaged in legislation at Washington seem to have a very small idea of the suspicion with which their acts are regarded by the majority of the people outside, who have gradually come in these latter days, rightly or wrongly, to regard the average Congressman (in the absence of proof of innocence) as a sort of "habitual criminal"; and, as an instance of this, we may refer to the fact that there are thousands of people, voters too, in this city who believe to-day that the recent revision of the statutes was a fraudulent job, and that they were really revised to heighten and lower duties; and this though there has been already one investigation on the subject.

---

In Congress, on Wednesday, Mr. Dawes succeeded in getting the Tax and Tariff Bill before the Committee of the Whole in the House, and it was debated at length, and a great deal of opposition was developed. Many amendments were proposed, but the only one adopted was that introduced by Mr. Cox of New York, to increase the duty on champagne in bottles fifty per cent. At the evening session, Mr. Butler reported a telegraph bill, making the telegraph lines "post-roads"—a thing which cannot be done under the Constitution, and which the House declined to do even under the previous question. In the Senate, on the same day, the Pinchback case came up, and Senator Ferry of Connecticut made an excellent speech in opposition, while some amusement was caused by an "issue" between Senator Stevenson and Senator West as to what the latter was smiling about; on which it appeared that Mr. West was smiling at Senator Stevenson's ignorance as to Louisiana politics. On the next day the Senate, by a vote of 39 to 22, tabled the resolution to admit Pinchback, some fifteen regular Republicans, including Messrs. Conkling and Frelinghuysen, voting with the Democrats.

The House discussed the Tax Bill again, and passed also an extremely important bill for the improvement of the mouth of the Mississippi by means of jetties, the work to be in the hands of a well-known and very skilful engineer, Mr. James B. Eads, he undertaking to do the work before claiming any pay—a very unusual and praiseworthy kind of offer, as offers go at Washington. On Friday, the Army Appropriation Bill was passed by the House.

On Saturday, in the Senate, Senator Wright of Iowa, from the Committee on Civil Service and Retrenchment, called up the joint resolution passed by the House last winter, providing that in all civil-service competitions disabled soldiers or their widows and orphans who pass the examination as the standard required "shall have precedence for appointment to any vacancy, anything in the rules of the civil service to the contrary notwithstanding," and the resolution was agreed to—yeas, 33; nays, 8. In the House, the Tax and Tariff debates were continued, and a motion to strike out the fifth section, restoring the ten per cent. "horizontal" reduction on manufactured goods, was voted down by 95 to 103. On this section the debate brought out the protectionists and free-traders in full force, and Mr. Cox of New York introduced a novel and effective argument, which we shall expect to see made great use of hereafter, as luxury grows and increases, by calling the attention of Congress to his clothes, begging the members to compare them with those of Mr. Field of Michigan, and then adding that his own were got in Canada for the sum of $21, and asking why it was that the same clothes which would cost $21 there we had here to pay $50 for. Mr. Kelley of Pennsylvania delivered a home-thrust at Mr. Cox, however, by observing that he did not wonder at the latter's going to Canada to buy his clothes, as his whole policy was to degrade American labor. This provoked loud shouts on the Republican side of the House, indicating the prevailing party belief that this Canadian suit of Mr. Cox's had been introduced into the country in violation of the laws for the protection of the revenue.

In the Senate, on Monday, the Indian, West Point, and Pension Appropriation Bills were passed, while the Pacific-Mail contract came up during the debate on the Post-Office Bill, Senator West saying on behalf of the committee having the matter in charge that the clause in the bill as it came from the House repealing the contract was reported without recommendations, since the question whether the contract of 1872 is still obligatory upon the United States was then undergoing investigation at the hands of the Senate Judiciary Committee. An effort or two was made to restore the franking privilege, without success. The House passed the River and Harbor Appropriation Bill, and agreed to the Senate amendments to the House Bill with regard to the selection of jurors in the District of Columbia, the object of the bill being to facilitate the trial of William S. King, of Minnesota, for staining his "escutcheon" by the commission of perjury. An act was passed by the House to prohibit the importation, for improper purposes, of Asiatic women, and Tom Scott suffered a heavy defeat on his Texas Pacific scheme, which seems to be killed by a vote refusing to make it the special order for Wednesday evening.

The probabilities that there will have to be an extra session of Congress in order to procure the appropriations, do not seem at this writing to be increasing. The Senate on Tuesday passed the Post-office Bill (voting down the Pacific Mail subsidy, on a report from the Judiciary Committee that the contract was no longer obligatory on the Government), and the Army Appropriation Bill also went through. Mr. Dawes's Tax Bill was made so ridiculous by amendments in the Committee of the Whole on Tuesday that he himself moved that the enacting clause be struck out, and carried it by a heavy majority. When this action was reported to the House, he tried to have it recommitted to the Committee of Ways and Means, but failed, and it was then sent back to the Committee of the Whole, the House, however, having meanwhile voted against striking out the enacting clause. Finally, Mr. Dawes withdrew the measure and offered a substitute, which chiefly differs from the first bill in taxing (at 90 cents) whiskey hereafter made, and none other, and this bill the House passed without debate. One of the jokes of the occasion was the offer of an amendment by one of the proprietors of the Saratoga Springs that all foreign mineral-waters should have a duty of three cents a quart, or twenty-five per cent. ad valorem, levied on them. This amendment was actually adopted, and yet members of Congress think it is the newspapers that make the public despise and laugh at them. The wrangle over the tariff has been mainly due to reluctance to restore the duty on tea and coffee. These articles once passed by, the field lay open to endless contention on the part of conflicting interests. Nothing now is heard of the Arkansas matter, but the *Tribune* every few days scurrilously publishes the President's proclamation of last May and his recent message in parallel columns, evidently designing to make a laugh at his expense.

The Connecticut Democrats have renominated Governor Ingersoll and their old ticket, with a fair prospect of carrying the State. Mr. David A. Wells was made permanent chairman of the convention—an unusual and deserved compliment. The resolutions demand the supremacy of civil over military government; denounce the interference of the Executive in Louisiana and Arkansas; demand hard money; declare that this is no time for increasing taxation. In the Congressional districts, or at least one of them which has a sort of reputation outside Connecticut, there is a prospect of a lively fight. This is the Fourth District, which Mr. P. T. Barnum at one time desired to represent, and which has actually been represented for four terms by Mr. William H. Barnum, a Democrat—a man of large wealth and party usefulness, but who has not been in the habit of considering that it was any part of his duty to spend his time in Washington, idling away his time in watching debates, and voting Yes or No. In fact, he has been pretty constantly absent from Washington, attending to business affairs, and travelling about the country, and has thus gradually come to have the name of an absentee who may be counted upon as likely to be absent at all critical times when his vote is needed. During the recent filibustering between the Democrats and Republicans, when his vote was sadly needed, Mr. Barnum was nowhere to be found, and it then came out that the only remembered existence of a vote cast by him was one in favor of the Pacific-Mail subsidy. Therefore, we understand, a movement is on foot among the Democrats to secure a successor for him in Judge F. A. Marden, who is understood to represent the young, progressive, and liberal Democracy, as opposed to the aged, plutocratic, and "absentee" interest.

The plaintiff rested in the Tilton-Beecher case rather unexpectedly on Tuesday afternoon, and the defence was opened yesterday. Considering the amount of trouble there has been about the matter, and the number of persons who professed to know about it, the number of witnesses called has been very small. The public has been greatly disappointed, and justly so, at the failure to produce Mr. Henry C. Bowen, and, indeed, should the defendant refuse to call him, will consider that there has been a failure of justice, and that weighty portions of the whole matter have been kept back. The notion that one of the high contracting parties to the "Tripartite Agreement" has no evidence to give about the affair is of course ridiculous. There is, perhaps, nothing in the case more comic—and there is a vein of broad comedy running all through it—than the position assigned to this instrument and the terms in which it is spoken of. The paper contains a silly, but in form solemn, agreement between three grown men not to spread dirty stories about each other, and is, in matter and manner, in all respects worthy of three big schoolboys or girls who were not kept closely enough to their studies. Instead of being burnt, however, as trash, it has assumed the rank of a state-paper, and is referred to with as much gravity as the Treaty of Westphalia or the Pragmatic Sanction, and it looks sometimes as if Tilton would seek its insertion in an appendix to Rymer's 'Fœdera.'

The only incident of note in British politics is the return, without opposition, of John Mitchel, the *ci-devant* exile of 1848, as member of the House from Tipperary County, and a motion, by Mr. Disraeli that, as he is a convicted and unpardoned felon, his election be declared void, and a new writ issued; which was carried. It would probably have been difficult for the "Home Rule" party in Ireland, if they had tried, to produce a better reason than this incident affords for believing that they will never get "Home Rule," and ought not to get it. When a powerful constituency passes over every respectable man in Ireland to pick up an old and half-crazy politician who has lived nearly thirty years out of the country, during which time he has made common cause with slaveholders and defended slavery, and tried to break up one of the few free and successful governments in the world, one feels that they are rather fitter for "a state of siege" than for constitutional government. Their next choice, after the illustrious Mitchel, is said to be his son, an ex-captain in the Confederate service, and of whom nothing else is known. There is a touch of the opéra bouffe about all this. Dr. Kenealy has also made his appearance in the House of Commons as member from Stoke-on-Trent, where he had a lively contest, and got in between the Conservative and Liberal candidates. The use which some of the new voters in the boroughs are disposed to make of their ballots seems not unlikely to bring a considerable number of queer people of the Kenealy type into public life. There is a widespread working-class belief even in England that the Claimant's counsel was the champion of the poor and oppressed, and that he was thrown over the bar by a triumphant and vindictive aristocracy.

---

The Russian Government has published a defence of the Brussels Conference in a semi-official article in the St. Petersburg *Invalide*. What it says is in substance that war is a very dreadful though necessary thing; that the usages which serve to mitigate its horrors have been much discussed by jurists and philosophers, but can never have their full effect until they are formally recognized and adopted by governments, because "Science has no power to enforce its own verdicts," and because the dicta of the professors and commentators are so often conflicting or obscure; that war, under the modern system of armaments, deranges the social machinery to a degree previously unknown, and, therefore, assumes a peculiarly cruel and destructive character, and hence the pressing need of precise official definitions of the rights and duties of commanders. "The primary object of the Brussels Conference" was, therefore, "not to make fresh regulations, but to select from the traditional, uncodified body of International Law those rules and usages adapted to the present time, and to convert them into acknowledged and binding statutes." This last sentence contains the objection to the whole scheme. Among the "rules and usages" are some which are favorable to a system of war carried on by a small force of regulars aided by determined and energetic irregulars or by what are called "popular risings," and which might be all that might be needed to repel an invasion. There are others, on the contrary, which are favorable to a system of war carried on exclusively by great organized armies, and despising or rejecting the aid of irregulars. In selecting rules and usages, therefore, for permanent adoption, the powers which maintain great armies would naturally incline to those which make great armies most effective, while those which are disposed to rely more on popular spirit and enterprise would naturally incline to those which increase the number of ways in which the private citizen may, without government orders, assail or harass the enemy; and the latter would inevitably suffer in any codification which the great European powers would be inclined to agree to.

---

From Germany there is little of importance beyond the rumor that Bismarck is likely to resign shortly, on attaining his sixtieth year, possibly under the pressure of increasing nervous debility, and possibly under the solicitations of his family, who are tormented by fears of his assassination, and not unreasonably, for the fight in which he is engaged with the Church is just the kind of thing to kindle the frenzy of fanatics. It is hardly likely, however, that he will permanently withdraw from the arena until after the Pope's death, as there is every reason to believe that a *modus vivendi* would be discovered by the new Pope which would end the conflict with the Ultramontanes, and thus really close Bismarck's work. This work did not, or does not, consist simply in the consolidation of Germany, but also includes the secularization of the state—or, in other words, the emancipation of the people from ecclesiastical control, whether Catholic or Protestant. The pressure of this ridiculous tyranny was felt at nearly every point of contact between the individual and the state. To what depths of absurdity it reached is illustrated by the story, which we believe to be true, that a woman seeking a license from the police to pursue a disreputable calling had to produce a certificate of confirmation. Fresh bills have been laid before the Prussian Parliament regulating the administration of ecclesiastical property, and securing the Old Catholics a proper share of it.

---

The debate in the German Reichstag on the law on the civil status (*Civilstandsgesetz*), and its final passage by 207 votes against 72, are the more interesting because the measure was principally called for by Bavaria, the citadel of Rome in Germany. The Bavarian Government did not take the initiative in the Bundesrath, but strenuously supported the bill in all its stages, because, as Minister Faeustle proved, to the disgust of the Ultramontanes, as early as 1831 both chambers of the Bavarian Legislature, in a formal resolution, expressed their conviction of the urgent necessity of such a law. At present, however, such a law could not be enacted in Bavaria, as it involves a change in the constitution, and therefore a majority of two-thirds, while in the Second Chamber the anti-Ultramontanes have a majority of but one. So the only help for Bavaria was an imperial law. Prussia was prompt to come to her aid, though she had to sacrifice her own law enacted only a year ago. The gain is of course a general one, and the value of it is increased by the manner in which it has been attained.

---

The Right and Left Centres of the French Assembly have come to an agreement about the constitution of the Senate, to which the Left, led by Gambetta, has given in its adhesion, and which seems to be in all respects excellent, and meets with Marshal MacMahon's approval. It consists in the election of 75 senators by the Assembly —whether independently, or from lists proposed by the President of the Republic, has not been settled—and the remaining 225 by the Departments and the Colonies. The former class are irremovable; the latter, who sit for nine years, are removable every three years to the extent of one-third. The Senate fills its own vacancies, and its functions are made to agree closely with those of the American Senate. It is difficult to overestimate the importance of such a measure carried in such a way. In the first place, a Senate of the kind proposed would be the most stable and respectable upper house which has ever existed in France. In the second place, the support of the scheme by the Left shows that the party has made enormous progress in its political education; and the passage by so large a vote of what must be regarded as the chief feature in the coming constitution, is, considering the very heterogeneous composition of the Assembly, a very encouraging sign as to the prevailing political spirit. The whole affair is, in fact, a striking confirmation of the opinion we have all along held, that the debates of the last four years, which some people have been so impatient to have closed, have been in reality the means of giving French public men, and the French people generally, the best piece of political training they have ever had. Contrast this slow and deliberate formation of the Government, after innumerable parliamentary trials of strength, and under light from every quarter, by the ablest men in France, with the old plan of getting one up in a room of the Hôtel de Ville, by half-a-dozen crackbrained orators, with an enormous armed mob howling outside.

## THE LATEST MUNICIPAL REFORM.

GOVERNOR TILDEN said, in his recent message to the Legislature, "that the problem of municipal government was agitating the intellect of all civilized peoples"—which is true; but we doubt if any "intellects" are as much "agitated" about it just now as those of New York City politicians. With them it is a permanent subject of agitation, although the problem, as they see it, is very simple, viz., how to get hold of city offices for distribution among the party workers. For the managing men on both sides, indeed, this has been for years the whole question of municipal government. The result is that no charter lasts long. In fact, it would be impossible, in the existing state of public opinion and with the present mode of administering municipal corporations, that it should. The first thing which any party that gets into power at Albany does, is to attempt legislation which shall give it the control of the city offices; and, if the first act does not answer the expectations of the leaders, they try another. So true is this that the discussion about the problem of municipal government which is now going on, as Mr. Tilden says, among thinking men all over the world, is really, as everybody knows, an object of secret amusement to New York politicians. They are willing enough to discuss it publicly, and to pretend to be greatly puzzled over it, and to be cudgelling their brains for a solution; but among themselves they always treat it as actually solved, and if they allude at all to the speculations of the jurists and philosophers, it is by way of joke. A good municipal government, to Bliss and Murphy, is one in which they control the appointments, and Tweed and Kelly take just the same view of the matter. Indeed, we doubt very much whether even Mr. Green would, if he were quite frank, not confess that this was his opinion too.

When the Republicans had possession of the legislature, there was a steady contest between them and the Democratic majority in this city on this subject. Now that the Democrats have possession of the legislature, we seem likely to have a contest between two sets of them—one representing the State, and the other the city—over the same subject. The city Democrats, represented by Tammany, have indeed grown to be a power which now thinks itself competent to treat with the State Democracy as an equal, if not a superior, and wishes to keep the city for itself as a real *imperium in imperio*. Under the present charter, the mayor has a right which the Republicans gave the late incumbent of the office when they thought they had control of him, of appointing the heads of departments on his sole responsibility, but he can only remove with the approval of the Governor. A new mayor, Mr. Wickham, representing Tammany, has now come into office, and he finds himself surrounded by his predecessor's appointees and protégés, some of whom, and especially Mr. Green, the Comptroller, are very obnoxious to the Tammany leaders, but of whom he cannot rid himself without the Governor's consent. Therefore, a bill has been introduced into the legislature known as the Costigan Bill, making the approval of the aldermen necessary to the mayor's appointments, but giving him absolute power of removal. In other words, should it become a law, the mayor would have to bargain with the aldermen before he could appoint, which last year was considered a very dreadful thing; but would not have to bargain with the Governor before he could remove, which last year was considered a very desirable thing. But principle has nothing to do with the matter. Tammany wishes to get rid of Green, and wishes to amend the charter for that purpose, and does not trouble its head any more than did those who have gone before it, about ideal city government. Governor Tilden has endeavored to meet the movement by a proposition, which was, however, defeated in the Assembly, that a commission should be appointed, containing Charles O'Conor and seven other leading citizens of the two parties, who should draft a general law, securing to municipalities the right of self-government, providing for the responsibility of municipal officers, and creating a carefully considered mode of removing them for cause, under which law all municipalities could organize. This, or something like it, is perhaps what is wanted; but the Democratic majority in the Assembly took no interest in the scheme, and the chances are that the Costigan Bill will pass the Senate and that the Mayor will be enabled to remove without the Governor's approval. We would advise our readers, however, not to become too deeply interested in the Costigan Bill even if it does pass, either as an experiment in municipal government or as a change in the existing machinery. The probabilities are that, at the outside, the arrangement it makes will last but a year or two, and will end in a quarrel over the patronage between the mayor and aldermen, and in a fresh resort to legislation by the party which is worsted.

The reason of all this is, let us explain once more, that all experiments in municipal government which we witness in this city are the quarrels of a large body of persons with little or no property of their own over the division of the property of other people, of which they have secured possession, and are at liberty, within certain wide limits, to use for their own purposes. What is called "municipal government" in our day ought simply, correctly speaking, to mean the collection from the owners of property of contributions for the paving, cleansing, and lighting the streets and public places. These are the main objects of a municipal organization in our time. It has no political character, as cities had of necessity in the Middle Ages; the political character is imposed on it partly through tradition, and partly to comply with the democratic theory that the majority ought to rule over all things. The result is that a large crowd of persons, from various quarters of the globe, fortuitously collected at this point and living from hand to mouth by daily or weekly wages, finding within their reach an immense concentration of property belonging to merchants and capitalists, declare that they and the property together constitute a mysterious body called "a municipality," with certain high, far-reaching, and indefinable aims and duties; and that it is, therefore, their duty to divide the property every year in whatever manner their leaders decide to be for the general good, naturally making it go as far in wages as possible. They would take precisely the same view of the banks if they could. That is to say, a large crowd of impecunious people would enter the bank parlor at the annual meeting of the stockholders, would declare that they and the stockholders together constituted "the people," that the bank was a political institution, to be administered by the people for the general good, and that its funds should be liberally used in providing employment for poor men.

The road towards radical municipal reform, and the only one, lies through the recognition of the fact that a city is in our age simply a corporation engaged in the management of certain property for the general comfort and convenience, and that the owners of the property are the proper persons to discharge the duties of it, under State supervision. There is of course little chance that so practical a view of the matter will soon obtain complete political recognition; but it already obtains some recognition, as when the consent of certain property-holders is made necessary to the laying down of a street railroad, and when they are required to lay down sidewalks, and keep them clean, and are allowed to do their own street-sweeping. One has only to push this a little further to get almost all that is to be hoped for in the present state of human nature in the way of municipal reform, and it might be pushed very far, while leaving the numerical majority, in the shape of State supervision, all that it can justly or beneficially claim of control over other people's goods. At present the Comptroller says the city debt is increasing at the rate of $10,000,000 per annum, and somebody is apparently expected by the newspapers to stop it; but nobody can stop it under the existing system, because the debt is being in reality increased by those who do not expect to pay the principal, and do not believe they pay the interest on it—in illustration of which we may mention that no laborer, skilled or unskilled, in the service of the city, receives the market rate of wages simply. Men are regularly paid $2 a day by the city treasury for work which is anywhere else worth only $1; and at this form of corruption and spoliation every city official connives, not excepting Mr. Green. Under these cir-

cumstances, it is natural and proper that the debt should increase. The outlay of communistic organizations based on simple greed ought, under the present order of the universe, to run steadily behind its receipts. We do not profess, as we have said, to be sanguine as to the adoption of the rational theory of municipal government, and doubt whether reform will come at last except under the whip of dire necessity. In fact, we think it not unlikely that the solution of the problem of governing great cities will be reached only through a process of competition between different methods. Cities trying one plan will thrive, cities persisting in another will decline, and the lesson will finally be learned through actual, though costly and prolonged, experiment. There are signs already in New York that this experiment has been fairly entered on, and that the work of spoliation will at last be arrested here, as it has been in other places, by the visible and rapid decline in the amount of the booty to be divided. In other words, the stockholders in the bank will refuse any longer to carry on business with the passers-by dropping in from the street, and will transfer their capital to places where they can manage their own business, under the State laws.

## THE BOSTON RAILROAD SCANDAL.

THE Boston exposure of the construction contracts of the Chicago, Dubuque and Minnesota, and the Chicago, Clinton and Dubuque Railroads, will probably do something, for the time at least, to fix public attention upon a branch of the railroad question which much needs it. The two roads we have named were built as dependencies of the Chicago, Burlington and Quincy Railroad; or, in other words, some four years ago the stockholders of this latter line, who are to a great extent trustees, and persons of small property dependent for their support upon the certainty of their income, received a notification that they were offered the privilege of taking some bonds to be issued by the new roads at the rate of ninety cents on the dollar, which would yield eight per cent. per annum, and which were amply secured. The first of the circulars offering the bonds was issued on June 7, 1871, by Mr. J. N. Denison, chairman of the directors of the Chicago, Burlington and Quincy, giving the stockholders the opportunity of buying $1,600,000 of the Chicago, Dubuque and Minnesota bonds, and stating that the company had received large local contributions in addition to the stock payments to aid in building the road. On March 7, 1872, a second circular was issued, offering a million and a half of the bonds of each of the new roads, stating that the main line of the Chicago, Dubuque and Minnesota was to be opened through early in the season, and that "business on the portion of the road in use fully equals the expectations entertained before the road was commenced," and that the bonds were "secured" at the rate of $25,000 a mile. Besides this, it was understood that one of the roads had a land-grant of 38,500 acres, worth from three to six dollars an acre, and there was also a "traffic guarantee" of the Chicago, Burlington and Quincy Railroad binding the latter road to set apart a certain per cent. of the earnings derived by it from the two dependent roads to take up the bonds. Here was indeed an offer! The "traffic guarantee" was, to be sure, of no great value (though the prudent investor hardly knew this), for this kind of guarantee only works during the prosperity of roads—that is, when it is not needed; the moment the traffic on the dependent road ceases to be sufficient to pay expenses and interest, at that very moment the promise of the main line to set apart some of it is apt to become of small value. But the other security was believed to be ample, and there was no reason why the bonds issued at ninety should not be worth par in a month or two, and there would be a nice little addition to many a modest but deserving income. This was not the first time that circulars of the same kind had been issued, and had not all the previous issues turned out well? So the trustee and the guardian, and the widow and orphan, and the small capitalist, put their savings into the new roads.

Unfortunately, however, the bonds went up only two or three per cent.; then they began to go down. Interest was at first regularly paid on them, and indeed was paid steadily till after the panic, but still the value of the bonds declined, and, after sinking to a point where it was difficult to say what their value was, they remained in a state of suspended animation, no interest being paid on them, the traffic guarantee having apparently escaped the attention of the guarantors. The widow and the orphan occasionally made enquiries of the guardian and the trustee, only to be told that the bonds would unquestionably "come up" if people would keep quite still and not talk about them in a depressing way. However, they did not keep still, but very wisely appointed an investigating committee to look into the condition of the property. It was then discovered that at the time the directors of the Chicago, Burlington and Quincy road were offering to the stockholders the bonds of the new roads, some half-a-dozen of them had taken shares in two construction companies, with a total capital stock of $440,000, formed under the laws of the State of Iowa; that they then, as contractors and directors, contracted with themselves to build the two roads; that the terms of the contracts were substantially that the construction company should receive all the stock, all the bonds, all the land-grant, and all the local aid given by towns and counties, and that the expenditure of these assets, together with the capital of the construction companies, should relieve the constructors of all liability, whether the roads were finished or not; that these same directors of the Chicago, Burlington and Quincy road, keeping these contracts, made by themselves with themselves for themselves, secret, proceeded to sell the bonds to the people for whom they were trustees—the stockholders of the Chicago, Burlington and Quincy—turning over the proceeds to themselves as contractors, and meanwhile prosecuting the work of building the road with such diligence and discretion that though the proposed line was 237 miles in length, by the time a hundred and eighty-two had been built all the bonds and all the stock and all the local subscriptions were gone, and, the contract having thus been completed, they ceased from their labors. It may be imagined that the expenditure of the money received from the sale of the securities was not subjected to a rigid supervision. Indeed, on the contrary, there was no supervision at all, the president of the construction company, Mr. J. K. Graves, being supplied with and expending the funds "as he called for the money"; and Mr. Graves, by a further extension of the principle of construction companies, used $173,000 of this money on another and totally distinct road, the Iowa Pacific, in which he was interested if no one else was—a sum which the committee of investigation naïvely say "has never been returned." What has become of all the land no one knows, except that the railroads do not own an acre of it. It will be noticed that the bonds were issued at $25,000 a mile, but as the roads are not finished, these are *proposed*, not constructed miles, making the actual bonded debt on one road about $33,000, and on the other $31,000. In sum and substance, the contract which these trustees made was that the money should be spent whether the road was finished or not.

To the eye of the common observer, it would appear that the history of these roads is the history of a fraudulent scheme, deliberately planned and well carried out by means of a systematic deception of the stockholders of the Chicago, Burlington and Quincy by their own directors and trustees. But this is not at all the view of the matter held by the directors and trustees implicated. Mr. J. M. Forbes, who took an active part in the investigation, denounced the contracts as "the most atrocious he had ever heard of or seen in railroad business," and said that he would have considered it an insult to ask a director in any road whether he was also interested as a contractor; but Mr. J. F. Joy, who seems the prime mover and concocter of the scheme, replied with an air of conscious rectitude that the contracts are unobjectionable, and that this is a common and proper way of building railroads, while a number of the contracting directors, gentlemen of good standing in Boston, have united in a card in which they speak of themselves as "sufferers" by the enterprise, and say that "as to the suggestion that we omitted to state to the purchasers of the bonds that we had

become purchasers in the stock of the construction companies, we desire to state that it does not seem to us, although there was no concealment of the fact, to be information likely to influence the purchasers of bonds, except favorably."

It must at once occur to everybody who reads this that it is a little strange that the directors should not have communicated information likely to "influence purchasers favorably"; but with that we have nothing to do. What we wish to call attention to is the renewed illustration this case affords of the manifold evils which arise from the existing secret system of railroad management. The stockholders have a nominal right to the examination of the books of the company in which they are holders of stock, but this is, as every one knows, an empty right. In the first place, its uselessness is proved by the fact that nobody ever uses it; and in the case of small stockholders, the class which especially need protection, it is a laborious, vexatious, and difficult process, which, from the very nature of the thing, they avoid. The bondholders, of course, have not even this protection. Besides this, the accounts of railroad companies are not kept on a uniform system, and the reports published by them from time to time are absolutely unintelligible. No two companies take the same view of operating and construction expenses. As the railroad commissioners of Massachusetts very justly say in their last annual report:

"One company earns more money than it cares to divide, and another earns less than its stockholders think they have a right to expect;—accordingly, the first buys property, or builds additional stations or rolling-stock, or charges off the cost of old ones, always to the account of operating expenses; while the second does just the reverse, and is continually reconstructing the same buildings, bridges, and rolling-stock. Accordingly, the cost of running a train one mile is returned at $1 30 on the Boston and Albany, and at $0 59 on the Springfield, Athol and Northeastern; at $1 56 on the Boston and Providence, and at $1 13 on the Boston, Hartford and Erie; at $1 39 on the Connecticut River, and at $1 04 on the Cheshire; at $1 33 on the New York, New Haven and Hartford, and at $0 87 on the Eastern."

From which it may be seen that even in the oldest States, which have the benefit of all the accumulated experience in the world on the subject, the same obscurity in railroad book-keeping prevails as in the West.

Now, what is the remedy for this state of affairs? It is already beginning to be admitted on all hands that it is chiefly publicity. This is what the Massachusetts railroad commissioners recommend, and it is also recommended in Wisconsin as one of the results of a year's experience of the Granger remedy. Our readers are aware that we have always recommended it in the columns of this paper. But admitting that publicity is necessary, how is it to be got? We believe there is only one way known to our civilization of giving publicity to transactions in private property, and that is a method which has been in successful operation for over two centuries. We refer to the publicity given to all transactions in real estate by the laws of registration. What there is to prevent the application of this system to railroads, we do not see. Let a State pass a railroad registry law, requiring the proper officers of any railroad company doing business in that State to file for record any obligation, agreement, or contract relating to the road; let it also be enacted that any document not so recorded shall not be binding not merely, as in the case of lands, on third persons, but on the parties themselves. We venture to predict that in that State at least complete publicity as to railroads will have been attained; that when a road is built by a construction company, the construction company will at once proceed in great haste to the office of the register and record the documents, and the stockholders of such roads as the Chicago, Burlington and Quincy will have an opportunity of judging for themselves whether contracts of a certain kind affect their inclination to purchase "favorably." Short of this we do not see any way in which publicity can be reached. Public returns are now compelled by the laws of some States, as New York and Massachusetts, but, though the returns are made, the public is no wiser. All that can be predicated of them, the Massachusetts commissioners say as to their own State, is that they are "plausible," and even plausibility seems a euphemistic term to apply to the returns we have quoted above. Short of public railroad registries, we see no way to the publicity everybody so much desires.

## VIVISECTION.

THE enemies of cruelty to animals are making all over the world an attempt to interfere forcibly with vivisections performed for scientific ends. The papers in England for the past year or more have been full of articles *pro* and *con* upon the subject, and the assistants of a French toxicologist who exhibited some experiments upon dogs at a large medical meeting have been criminally prosecuted. Professor Schiff, a great physiologist, and we believe a thoroughly kind man at heart, but a great "consumer" of dogs, has also been dragged before the courts, and all but ostracised socially for his pursuits. In this city, the society for preventing cruelty is understood to be preparing a prohibitory bill to be passed at Albany; while the physiologists, on the other hand, are arming their cause betimes by printing and circulating various apologetic documents. Among these the one most worthy of mention is the pamphlet by Dr. Dalton which we noticed last week, and in which some of the therapeutic benefits which have already accrued from vivisection are set forth with great clearness and sobriety.

To our minds, there has been in the treatment of the subject by both sides a certain superficiality. The attack has been weakly made, owing to the all but total ignorance on the part of the attackers of the concrete details of physiology and physiologic experimentation. When Mr. Bergh singles out for particular horror the comparatively trivial operation for gastric fistula, and huddles together as scientific authorities against the usefulness of the vivisectional method of research a crowd of surgeons, philosophers, anatomists, and ignoramuses, most of whom wrote when physiology in its modern sense can hardly be said to have existed, and some of whom never thought what he alleges, he makes the game simply too easy for his opponents, and the result is a certain insincerity in their retorts. To retort that in most cases anæsthetics are given is true enough, but then it is probably far more distressing to a dog to be etherized than to have an artery tied. To say that a rabbit's pain differs *toto cœlo* from human pain, in that the moral element, the element of subjective *horror*, is absent, is also true, but does not extinguish the charge of cruelty. The question is not, Do we make rabbits suffer as much as men? but, Do we give them all the pain that they are susceptible of suffering, be that much or little? If so, we are cruel; and there is no doubt that vivisectors are often obliged to go to this extreme.

Let it then be frankly admitted, without higgling about more or less, that, in principle, vivisection admits of cruelty; let it also be admitted that the therapeutic benefits we have gained by it are as yet minute, and that even the physiological laws discovered by it are full of uncertainty and liable to incessant correction. After making to Mr. Bergh these extreme concessions, we still absolutely and totally deny the expediency of any legislative regulation of the matter, though we avow that we heartily sympathize with his humane motives, and, for reasons that we shall soon state, should be by no means sorry to see a rather angry state of public sentiment prevail upon the subject.

Man lives for science as well as bread, and if Mr. Bergh will throw his ridiculous fagot of antediluvian oracles out of the window, and open any modern treatise whatever on physiology, he will find that the entire science is based, immediately or remotely, upon vivisectional evidence. What is not is hardly enough to swear by, except, perhaps, in the chapter of the special senses. Moreover, the vivisectional results of to-day, which are liable to be corrected to-morrow, will be corrected by the vivisections of to-morrow and by nothing else. To taboo vivisection is then the same thing as to give up seeking after a knowledge of physiology; in other words, it is sacrificing a human intellectual good, and all that flows from it, to a brute and corporeal good. We live in a world in which it is universally admitted that sacrifice is a universal law—no good comes without some loss. One may absolutely protest against this, and refuse to be its accomplice—say, like a Buddhist, *neminem laede*, though the human race and all vain earthly science perish; one may, in other words, lead a consistently ascetic life, and we shall not gainsay him. We will only say that in modern Christendom he will have few followers. Once assume that the world and its law of sacrifice may have a good meaning, and it must follow that the duty of the righteous man will often consist in inflicting pain as well as in enduring it. Vivisection is, in other words, a painful duty. We wonder

that theologians have not often used it as a parable to reconcile their hearers to the evils of human life. A dog strapped on a board and howling at his executioners, or, still worse, poisoned by curara, which leaves him paralyzed but sentient, is, to his own consciousness, literally in a sort of hell. He sees no redeeming ray in the whole business. Nevertheless, in a world beyond the ken of his poor, benighted brain, his sufferings are having their effect—truth, and perhaps future human ease, are being bought by them. He is performing a function infinitely superior to any which prosperous canine life admits of, and, if his dark mind could be enlightened, and if he were a heroic dog, he would religiously acquiesce in his own sacrifice.

So much for the principle. We admit that, as regards the practice, advocates of humanity have a good field open to them in trying to restrict the amount of *useless* vivisection. A working physiologist, too, often gets to consider his animals as mere bundles of reactions, and to forget the conscious accompaniment; and to a lecturer, the awakened attention of his hearers, and the applause that always greets a striking experiment, are so many temptations to crowd his course with "brilliant" demonstrations. These, it must be often confessed, appeal far more to the mere love of amusement and sensation of the students than to their more intellectual part. A lecturer on respiration in Paris will hardly fail to demonstrate the necessity of oxygen for life by putting a sparrow under an air-pump, immersing a rat in carbonic acid, and perhaps suffocating a guinea-pig in nitrogen. We have heard that a distinguished toxicologist of Berlin, when he wishes to exhibit the effect of corrosive substances on the alimentary canal, simply thrusts a funnel down the throat of a living rabbit, and pours sulphuric acid into it. These are plainly revolting excesses, and it is pleasant to think that no physiologist of Anglo-Saxon blood is likely to be guilty of them. Nevertheless, it is probably true that in lectures both here and in England experiments are continually repeated which can either not be adequately observed by the class, or which, if observed, might be all but equally well understood from description. Nothing is more calculated to deaden the moral sensibility of students than familiarity with blood shed for trifling ends. To help their lazy attention, to save their imagination a little effort, or to atone by this sort of spectacular attraction for the dulness of the teacher or the theme, seems surely an end unworthy of the costly means. We think, too, that physiology is utterly unfitted to be taught practically, as physics, chemistry, botany, and anatomy are now being taught in colleges, as means of educational discipline. These other branches are quite sufficient to give students a general training in scientific habits. The physiological laboratory ought to be reserved for investigators. We do not know what exercises Dr. Foster's class of students in practical physiology in Cambridge, England, are made to perform, but we hope and suppose very little vivisection. Our power over animals should not be used simply at our own convenience, but voluntarily limited and sparingly put forth. But the decision when to exert it and when to refrain should rest solely with the investigator himself. If a sweeping prohibitory law were passed, it would of course be a dead letter in a community which boils millions of lobsters alive every year to add a charm to its suppers. By hook or crook, physiologists would operate on living animals in spite of the vigilance of a thousand humane societies; just as, when the anatomy law was under discussion in England, Sir Astley Cooper told the legislative committee that if he could not have legally the bodies of outcasts, he should have illegally the bodies of members of parliaments. Bodies of some sort were needed and would be forthcoming. If it be proposed only to frame a law to punish such abuses as that of the German toxicologist above-mentioned, we still think it would be impracticable. A jury of experts would be very apt to shield their colleague, and a jury of laymen not to decide reasonably at all. Even if the guilty could be justly convicted, conscientious operators would be liable to a series of *tracasseries* and lawsuits which would seriously affect their usefulness. It is better for many quadrupeds to perish unjustly than for a whole scientific body to be degraded. Here, as elsewhere, the best plan is not to hedge men in by mechanical restrictions and safeguards against abuse of power, but to get good men, give them great authority and right of initiative, and make them responsible to public opinion for the result.

And this brings us to a point in which we think the Society for the Prevention of Cruelty to Animals may do great good. Let them act morally, through public opinion, and foment, if need be, public execration of physiologists; at all events let them encourage the dislike of bloody demonstrations in lectures. They will then do good both to the animals who are victimized, to the students who demand that their eyes and not their understandings shall work for them, and to the teachers who weakly yield to that demand. Under this hostile pressure, this constant sense of being challenged—which is very different from the sense of being controlled—the vivisector will feel more responsible, more solemn, less wasteful and indifferent.

## THE GENESIS OF A MIRACLE.

GRENOBLE was all astir, during the first two or three days we spent there, with arriving and departing pilgrims. We presently discovered that chance had brought us to that place on the anniversary of the apparition of Notre Dame de la Salette, an important festival throughout the region. The guide-book note on the pretended miracle of the Salette had astonished and amused us, but the matter assumed a more serious aspect when we saw with our proper eyes throngs of actual pilgrims—chiefly white-capped women and dusty-skirted priests—who had been devoutly visiting the shrine. In the miniature reading-room of our dim and ancient but well-appointed hotel we found a large, handsomely illustrated volume on the 'Pilgrimage of the Salette,' which we studied with interest. It was our introduction to the voluminous literature of the subject.

La Salette is a mountain in the Department of the Isère, near the small town of Corps, which is distant by the high-road some forty miles from Grenoble. It is claimed that on Saturday, September 19, 1846, between two and three o'clock in the afternoon, the Virgin Mary appeared to a shepherd boy and girl who were guarding cows near the summit of this mountain. The boy's name is Maximin Giraud, the girl's Mélanie Matthieu. I make the following extracts from Maximin's own story, as given in the most orthodox and approved versions. He begins:

"After having watered our cows and eaten our lunch we fell asleep near a little spring that had run dry. Then Mélanie woke up first and waked me to go and look for our cows. Then Mélanie saw a great light towards the fountain, and she said to me, 'Maximin, come see this light.' I went towards Mélanie. Then we saw the light open, and inside we saw a lady sitting. And the lady got up, folded her arms, and said to us, 'Come on, my children; do not be frightened; I am here to tell you great news.' Then we went on, and the lady came towards us a few steps from the place where she had been sitting, and she said to us, 'If my people will not submit, I shall be forced to let go the arm of my Son; it is so heavy and weighs me down so that I can hold it no longer. Oh! the time I have suffered already for you! If I will not have my Son abandon you, I am charged to pray to him for you who do not care. I gave six days to work, I reserved the seventh for myself, and they will not give it me.'"

Here follows a prediction that the potatoes will rot before Christmas. But at this point,

"Mélanie, who did not understand, began to ask me what it was about. The lady replied, 'Ah! you do not understand, my children! Wait, I will say it differently.'" She then begins to speak in patois, repeating the prophecy concerning the potatoes, and adding others of equal moment. An injunction is addressed to the children to say as many Pater Nosters and Ave Marias as they can, and the complaint is made that no one goes to mass "except a few rather old women (quelques femmes un peu âgées). In Lent they go to the butcher's like dogs. . . . She terminated her discourse with these words: 'Well, my children, you will make this known to all my people.' Before disappearing, the Belle Dame rose from the ground and remained suspended in the air a moment, then we no longer saw her head, then her arms, then the rest of her body. She seemed to melt away. And then there remained a great light that I tried to catch with my hands, with the flowers that she had on her feet, but there was nothing there. . . . In the evening, when we arrived at our master's, I was a little sad, and as they asked me what was the matter I told them all the lady had said to us."

The accounts of the miracle lay much emphasis upon a secret which the lady is said to have confided to each of the children separately, at a certain point in her discourse, each in turn becoming deaf while she spoke to the other.

The next day the curé of the village from which the mountain takes its name announced the event to his parishioners. They were not at first greatly impressed. It may have seemed to them superfluous for the Virgin to bring the warning against eating meat in Lent to a population accustomed to the luxury of animal food perhaps once a year. But the story spread rapidly. Curious visitors, who soon became pilgrims, began to seek out the scene of the apparition. All were eager to drink at the spring, formerly intermittent, but perpetual and abundant since the Virgin's tears fell upon its source. The priests of the region vigorously propagated the belief in the miracle. It is said that the people of Corps, like their neighbors of La Salette, did not in the beginning treat the apparition with much respect. But when the material advantages were pointed out to them that would accrue from the vicinity of a popular shrine, their convictions underwent a change. Great pains were taken to prove that the children could not have manufactured the story. Mélanie is described as heedless, disobedient, lazy, and sullen; Maximin was a stupid, greedy little boy who, until within a few days before the apparition, had

been still more humbly employed than in tending cattle ("à ramasser du fumier sur la route"). "The children were, in short, untaught and coarse; incapable of enthusiasm or exaltation, and still more incapable of inventing and executing a concerted plan." That such children would be the easiest of dupes does not appear, even in the light of after-events, to have been considered. The wonder of floating draperies and glittering ornaments was more than enough to make the Belle Dame seem to them the heavenly visitant she styled herself.

An ecclesiastical commission was appointed to examine the miracle, and reported favorably. The number of pilgrims increased. Wonderful cures wrought by the water began to be heard of. At the end of five years the Bishop of Grenoble issued a decree in which he proclaimed the occurrence witnessed by the shepherd children a veritable apparition of the Blessed Virgin, and authorized the worship of Notre Dame de la Salette. In a short time the large church which now marks the scene of the apparition was begun. Arrangements were made for exporting the water, in which there sprang up directly a flourishing trade. The present income from this source is said to amount to sixty thousand dollars a year.

Opposition to the miracle, which had existed from the first, now took definite shape. It was led by two priests named Déléon and Cartellier, who published a succession of small works accusing a certain Mlle. de la Merlière of having performed the miracle. This lady's eccentricities of religious zeal had long been notorious, and the charge found ready belief. A mandate from the Bishop of Grenoble denounced the offending priests and forbade the faithful, under penalty of excommunication, to read, keep, or propagate their books. Cartellier submitted to the decree of his bishop, but Déléon refused to yield, and was suspended. Mlle. de la Merlière next brought an action for libel against Déléon and Cartellier, which was tried in two courts at Grenoble. The verdicts of both acquitted the defendants on the ground that they had shown no libellous intention, and that Mlle. de la Merlière had suffered no damage from their charge; her reputation remained what it had been before. In the second trial the celebrated Jules Favre acted as counsel for the plaintiff. A full stenographic report of this case is published in a volume of nearly four hundred pages. I was fortunate enough to find a copy on the back shelves of a Grenoble book-shop. The keen-faced woman who kept the shop took no offence at the question whether in Grenoble one really believes in the Salette. "Eh, bien," she replied, with a cheerfully sceptical shrug of her shoulders, "those near by always believe less than those further off. And then, here, all the world has known Mlle. de la Merlière." Favre is reduced to some curious arguments in vindicating his client. Mlle. de la Merlière was too old and stout to have climbed the mountain unaided (she was barely fifty), or to have walked over the grass, as the Belle Dame did, without making it bend beneath her weight. Such a costume as that worn by the lady of the apparition could not possibly have been prepared in fifteen days. He labors at great length to prove an *alibi*, and closes by vehemently insisting that a confirmation of the first judgment will stamp his client as the heroine of a detestable fraud. Déléon's counsel is so sure of his case that he allows himself and the court the relaxation of a laugh. He easily disposes of the *alibi*, which, in fact, only applies to the day before the apparition, and brings a formidable mass of positive evidence to support Déléon's charge. An epigram in the plea of Cartellier's counsel sums up the general impression left by the proceedings: "The Salette is a miracle very lightly admitted, a miracle admitted upon very meagre proof, so meagre that one might be tempted to see a miracle, not in the thing, but in the admission of the thing." Although the bearing of this reiterated verdict was made plain by Jules Favre, it had no disastrous effect upon the new shrine. The Catholic authorities pass it by as an "incident in the private lives of M. Déléon and Mlle. de la Merlière, from which no induction can be drawn either for or against the miracle of the Salette."

Even the tedium and discomfort of a Dauphiné stage-coach did not prevent us from enjoying the drive between Grenoble and Corps when we set out on our irreverent pilgrimage. A glowing September day threw a glamour where none was needed over broad valleys and green hillsides and tiny sparkling lakes and distant blue mountains. When we reached Corps, an hour or two behind time, the full moon was magnifying a hundredfold the picturesqueness, and veiling with her silver the squalor, of that vulgar little town. The hideously unclean inn where we were forced to eat and sleep, quickly dispelled the illusions of the moonlight, which later only served to aggravate the horrors of a night actively devoid of ease. I have no reason to suppose that our pilgrimage to the Salette was of any spiritual advantage, but as a mortification of the flesh it was all that could be desired. The walk up the mountain next morning was quite without interest. The path is wholly shadeless and the heat was most irritating. One would scarcely believe that mountains could compose so commonplace a landscape. Its defects are the want of outlooks and the absence of any play of light and shade. The path is long and in parts steep, but perfectly easy. The "precipices and brinks where only a shepherd can keep his balance," which Favre described, could never have existed save in the fancy of that ingenious orator. We reached the scene of the apparition in time to hear the discourse delivered every morning during the season by one of the Fathers of the Salette, a fraternity founded to guard the shrine and stimulate the worship of the new Madonna. The concourse of pilgrims culminates each year on the 19th of September. Few are looked for after that date. There were still enough, however, to maintain a brisk trade in small flat bottles of the miraculous water and in religious trinkets vended at several gay stalls.

A considerable group of devout listeners was seated on the slope opposite the spring. The preacher took his stand beside the small stone basin into which the precious fluid now trickles from a leaden pipe. Behind him, a sitting figure, in bronze, represents the Belle Dame, as first seen by the children, who also appear in attitudes of surprise and consternation. A winding path up the slope, protected by railings and thickly planted with crosses, marks the Lady's course when she withdrew. The father presently called attention to a striking similarity, observed by those who had visited the East, between the sinuosities of this path and those of the road up Mount Calvary traversed by Christ. At the top of the small mound there is another group of statuary, depicting the close of the Lady's interview with the children. This is the group that usually adorns, and often surmounts, the chapels dedicated to Notre Dame de la Salette. It stands here opposite the church, an imposing pile, flanked on either hand by large buildings of similar design, for the entertainment of pilgrims. The enclosure of the spring is further decorated with crutches, left as tokens by cripples whom the potent water has restored. As our guide—a sturdy old peasant woman—solemnly assured us, numbers of such afflicted persons are carried up the mountain in chairs, or make the ascent on mules, and walk down in a miraculous manner. The details of these cases are reported with much unction in a monthly paper published by the Fathers of the Salette.

The preacher, on the day of our visit, gave the familiar story of the apparition, trying hard to invest it with profound moral significance, but in fact justifying a disrespectful criticism of Jules Favre's, who characterized the Virgin's speech as too puerile to have been invented by his client. Our priest considerately left out the slighting allusion to the few rather old women: his audience was chiefly composed of persons to whom that designation would have been pointedly appropriate. He spoke with pride of the large sum, two million five hundred thousand francs, which has been contributed for building the church and *hospices*, and of the world-wide repute of the sacred water. Among the miraculous cures he recounted was that of a scrofulous bald gentleman who not only overcame his disease by a believing application of the Salette water, but also, to his boundless surprise and joy, brought out a fine growth of hair. A case of suspected diabolic possession was verified by blasphemies which the victim uttered against the Salette. The father told his hearers with a great show of frankness, what every one knew, that the Salette is not an article of faith—we were free to believe or not as we chose; but he suggested that, as a matter of pure and voluntary devotion, the acceptance of this miracle might be an act of greater merit than submission to an authoritatively promulgated dogma. He also referred to Maximin, admitting that he has perhaps a slight weakness (*un petit faible*) for drink, but had himself never seen him intoxicated. About Mélanie he had nothing to say. She has become a Carmelite nun at Marseilles. The *Pilgrimage* states that the fathers of the Salette are ignorant of her present residence, and prefer to remain so, in order not to be obliged to answer indiscreet questions. The same authority strongly affirms that she is *not* a *mauvaise religieuse*, and has *not* swerved from her faith in the Salette, nor been kept out of sight as a half-lunatic renegade. These are pathetic suggestions as to the fate of the little shepherd girl, who, for some cause or other, has not proved a satisfactory witness to the miracle. Our orator's peroration was an appeal to all who heard him to become not converts merely, but missionaries of Notre Dame de la Salette.

The church is internally of fine proportions and massive architecture. It is profusely decorated, and very brilliant in general effect, as well as rich in detail. The building stone, excepting the costly marbles, was brought from a not distant quarry; all the other materials were carried on mule-back for at least three hours. The side walls are lined with votive tablets acknowledging grace received in the widest variety of needs. In the sacristy we saw the treasures of Our Lady of the Salette—already a very

showy collection—embracing many valuable gifts of gold and silver vessels and heavily jewelled ornaments. The father who displayed them rather apologized, however, with the remark, "It is only a beginning."

On our return to Corps, we had the satisfaction of seeing Maximin. He is now settled there as a dealer in pinchbeck souvenirs of the Salette, and liqueurs professedly made from plants of the "sacred mountain." It was not until he had tried several other careers that he at last devoted himself to his present tranquil industry. For a number of years after the apparition both he and Mélanie were strictly housed in a convent. Rationalistic critics like Déléon hold that during this time the children were trained for their future rôles, and carefully drilled in the unvarying uniformity which is claimed as a marvellous feature of all their recitals. Released from the nuns, Maximin proved lazy and unmanageable. Various expedients were resorted to, but everywhere he defied control, and resented punishment by damaging statements about the miracle which depends so largely upon his testimony. This is not an age in which he could be conveniently lost to sight, and the policy finally adopted was that of unlimited license. Indulged in every way, he became perfectly docile in the hands of the Salette fathers. Both he and Mélanie have attempted prophecy. The destruction of Paris in the month of October, 1853; the invasion of France by the Russians; the return of the Apostles to announce a new Gospel—these are a few of the momentous events predicted by the intrepid young seers. Their famous secrets, divulged to no one else, were solemnly communicated by letter to the Pope, who vigorously characterized them as a "world of bosh" (un mondo di stupidità). It may be noted, however, in passing, that while his Holiness has never officially endorsed the Salette, he has not scrupled to give it the practical sanction of numerous indulgences to its devotees. The whole history of the apparition is an interesting study of the genesis and growth of religious myths. As a gentleman in Grenoble said to me, in another fifty years, when all the persons directly concerned are dead, the miracle will doubtless be as fully accredited as the Immaculate Conception itself.

Maximin is now a man of about forty, whose appearance justifies his reputation, which is that of a common profligate and drunkard. He courts the notice of strangers and poses for their edification. To the suggestion that he had probably pretty much forgotten the details of the apparition, he replied, with a sanctimonious roll of his eyes, "Oh! non, Monsieur, ça ne s'oublie pas" (Oh! no, sir, such a thing is not to be forgotten). He would call our attention to one or two particulars which the Père on the mountain may have omitted to mention. The lady's form was not only radiant but transparent. He had looked through her at the hills on the other side. He explained the phenomenon of his accurately reporting the uncomprehended French as part of the miracle—an effect, moreover, which was not evanescent. From the day of the apparition he as well as Mélanie, neither of whom could speak a word of French before, were able to use the language with ease. Here, however, the miracle was apparently not first-class, for Maximin's French is provincial in the extreme. It was strangely in contrast with the faultless elegance of style in a little book which he sold us, called 'Ma Confession de Foi sur la Salette,' and written, as he repeatedly averred, with his own hand. We found, in short, nothing about Maximin to support the argument against Déléon's theory of the miracle used by the *Pilgrimage* as its climax of proof: "How, finally, could the coarse swindle of a stupid farce have produced in the minds of the shepherds the marvels of good sense, of wisdom, and of energy?"

It was like passing from an ill-kept cell of the Middle Ages into the freshness of sunshine and green fields and summer airs when we drove out of Corps and turned our faces toward the Protestant valleys of the High Alps, the scene of the heroic work and sacrifice of Felix Neff.

## THE LIBRARIES OF PARIS.

PARIS, January 29.

ONE of the noblest traits of the American character is the encouragement given in all parts of the Union to the development of public libraries. There are already libraries in Boston and New York which may be envied by some of the capitals of Europe. I know of no special book describing the libraries of Paris and giving their history. No capitol of Europe, except London, can boast of libraries as magnificent as those of the French capital; the British Museum is incomparable in many respects, bu the National Library of France is in some respects superior to the British Museum. Of late years new rooms have been built, somewhat on the plan of the magnificent blue room of the British Museum, so airy, so silent, so well adapted for study. The National Library fills a large block between the Rue Richelieu and the Rue Vivienne; in the beginning it filled only a part of this huge block. It is divided now into many departments. One of the most delightful, which is too little visited by foreigners, is the department of *estampes* (engravings), lodged in a pretty, old gallery. I visited it only a few days ago, and one of the curators showed me an album of a lady of honor of the Court of Catherine de Médicis, with the portraits from life of all the important men and women of the time, in the charming style of our Clouet (called Janet). Such collections are invaluable, and the department of engravings and drawings has any number of them. There are as many as 400,000 portraits in it alone. The department of medals is also extremely interesting. An introduction to one of the curators is necessary if you wish to see its finest treasures, the old Greek medals of the great school, the finest gems. There is a department of manuscripts, divided into all the possible languages, from French to Chinese, and containing more than 100,000 volumes, 8,000 of which, at least, are adorned with precious miniatures.

These three departments are, so to speak, limited, as nothing is added to them except what is very valuable. It is not so with the department of printed books, as the law obliges publishers to give to the National Library a copy of every new work. The number of additions every year in this department amounts, on the average, to 25,000. How many volumes are there in this department? is a question often asked, and which it is not possible to answer correctly, though the greatest order prevails in it—so much so that it does not take more than a few minutes to find any edition of any printed work. Somebody has measured the length of all the shelves of the library; put together, they would make as many as fifty-five kilometres. The number of books placed on these shelves amounts to about two millions. Would you form an exact opinion of the intellectual state of the great majority of readers, of those who frequent the ordinary reading-room? You will at once see how narrow is their horizon when I tell you that out of the two million books in the Library, twenty thousand are amply sufficient to meet the demands and satisfy the tastes of the ordinary public. The higher class of readers, men who work and make researches, are furnished with a special card and meet in another room, called vulgarly the *Mosquie* (I never knew why); about two hundred people are seen there every day. For a lover of fine editions there is a precious sanctuary, to which only a few are admitted, called the *Réserve*. It is composed of books which are never let out to read, but which are preserved as monuments of the arts of printing, or binding, or as original editions. Nothing can exceed the beauty of this reserve fund; all the finest libraries I know are as nothing in comparison with it. I will say nothing of the secret museum, the *Enfer*, as it is called, which contains volumes which are never, under any pretext, given to any reader. There are only 730 volumes, representing 340 works, in this part of the Library; a number which may seem small if you remember that the Library is the great sea into which everything flows.

The Mazarine Library takes its name from Cardinal Mazarin, who established it and named as its first librarian Gabriel Naudé, the author of various works, the best known of which has for its title 'Considerations on *Coups d'état*.' It occupies a wing of the little palace built opposite the Louvre. It is chiefly designed for the members of the Institute, but is also open to men of science and men of letters. One of the last librarians was Philarète Chasles, and many are the stories told of this eccentric writer. He was—not to use a stronger word—very odd, and on one of his days of bad humor, when somebody asked him for a book, he stoutly denied its existence, to the utter bewilderment of the unhappy applicant. Jules Sandeau is now among the curators of this library.

The Arsenal Library is not so well known to foreigners, as it is in a very distant and deserted part of the town. It had for a long time Charles Nodier among its curators. This library was formed by the Marquis d'Argenson, who was a great bibliomaniac, and who was ruined in the end and forced to sell his books. They were bought by the Comte d'Artois, who never had much literary reputation, being known as a man of pleasure. He bought, however, besides the D'Argenson library, the large and magnificent library of the Duc de la Vallière. These two libraries together formed quite a large collection, and one which is extremely remarkable for the choiceness of its material. All the French poets of the sixteenth century, for instance, are found there in their original editions. Boileau and the classic school of the seventeenth century long since consigned these early poets to oblivion, but they are now much sought after, as there was in the school of Ronsard, together with much bad taste, a certain freshness and a poetical richness which were lost afterwards. There are now in the Arsenal, the old palace of Sully, the minister of Henry IV., as many as 250,000 volumes and about 6,000 manuscripts.

On the square of the Pantheon is a large and new building, which con-

tains the library called Sainte-Geneviève. It was built by a very good architect, and might serve as an excellent model for the library of a large town. It embraces only about 120,000 volumes and 3,000 manuscripts. It belonged first to a convent of *Génovéfains*, and the first books inscribed in its lists are those of Cardinal de la Rochefoucauld, who was an abbot of that convent. Mary Stuart sometimes visited it in her youth, and afterwards sent a portrait of herself, which is very carefully preserved.

The City of Paris formed a library which contained all the books and documents concerning the capital of France. It was lodged in the Hôtel de Ville, and numbered 120,000 volumes. It was burned, alas! with that splendid palace, as well as the small library of the Louvre, and a part of the curious archives of the police department. The city of Paris is forming a new Parisian library; ten thousand volumes have already been bought, and they have been placed in the charming Hôtel Carnavalet, which was once the habitation of Madame de Sévigné. A visit to this hôtel, which had fallen almost in ruins but which the city government has recently restored with much taste, would be very interesting to a traveller. The hôtel was built after the drawings of the famous Pierre Lescot by Ligneris; it was decorated by Jean Goujon, the most eminent sculptor of the French Renaissance; it is now in perfect order, and, besides a library which contains only documents concerning Paris, it has received a sort of Parisian museum, showing all the old types of Parisian workmanship in all branches of the arts.

There is a large number of other libraries attached to the various institutions, like the library of law books in connection with the Courts of Justice. I will only mention those of the Conservatory of Arts, of the School of Fine Arts, of the Schools of the Ponts et Chaussées and of Mines, of the Sorbonne, of the Academy of Medicine, of the Chamber of Commerce, of the ancient Senate, of the French Theatre (the most complete collection of French plays), of the Conservatory of Music, etc., etc. One of the peculiar institutions of Paris is the small reading-rooms to be found in a great many streets and passages, which are at the same time circulating libraries, such as you find in England. But in England I have nowhere seen any reading-rooms attached to the circulating libraries, while in Paris there are men and women who spend a few hours every day in these reading-rooms. They are admitted for a trifling sum, and they can read there all the newest books, novels, periodicals, sooner and more easily than they would be allowed to do in one of the large libraries of the State. These small reading-rooms are generally dingy places, under the supervision of a lady, who gives out books, always unbound, often tattered and torn. They have become, however, valuable and interesting lately for the bibliophiles; for some of these, finding no more original editions of the great writers of the seventeenth century, have begun to collect the original editions of the school which called itself romantic at the beginning of this century. You have no idea how rare some of these books have become, rarer, indeed, than the Alduses and Elzevirs. Lamartine's first 'Meditations,' for instance, was issued in a small edition of a thousand copies; a number of other editions followed rapidly, but your bibliophile will have the first. Now, what has become of these thousand first copies? Many have been destroyed; some have been buried in old libraries; some have been bought by the circulating libraries; among these last a copy must be found. The copies of these small libraries have one invaluable advantage: they have not been bound, and consequently their margins have not been cut. They may be dirty, have inkspots; a good binder will cure such defects with ease, but a cut margin is a defect which nothing can mend. The first bibliophiles who thought of looking upon the shelves of the circulating libraries, collected with ease the original editions of Lamartine, of Victor Hugo's poems and dramas, of Alfred de Musset, of Béranger, of Mérimée, of Balzac, of Madame Sand. The ignorant persons who, to their great astonishment, found people offering to buy from them books which nobody ever asked to read, which were lying in the dust of the upper shelves (as in such libraries nothing is read but the most recent books), have now completely lost their heads; they fancy that they have a treasure in every dirty yellow volume which has gone through their hands. They see no difference between the 'Odes et Ballades' of Victor Hugo and a novel of Paul de Kock, or of some of those novelists who are completely unknown to the literary world, but who are the gods of a large public. It is quite amusing to see the value they place on everything; they are perplexed, however, if you refuse their extraordinary offers: they have heard of volumes which they had sold for two francs and which were resold for two hundred.

The small reading libraries are not increasing in number; the multiplication of clubs has done them much harm, as every club now has a good library. A gentleman in easy circumstances goes to his club if he has no library of his own.; these old-fashioned libraries have, therefore, become the resort of very poor gentility, either male or female. They are interesting to visit, in this respect. You will find there a mixture of shabbiness and decency, of decay and courtesy, which is almost melancholy. I dare say that in fifty years none of these establishments, once so flourishing, will remain in existence.

# Correspondence.

## THE MONTENEGRIN PORT.

To the Editor of The Nation:

Sir: In your last number I find it stated that Turkey has three harbors on the little strip of territory which separates Montenegro from the sea. In view of the fact that the territory lying between Montenegro and the sea belongs to Austria, and further that the northernmost seaport of Albania is some distance south of the Montenegrin limits, it may be permitted to enquire what are the three seaports alluded to.

Yours truly,

Stuart Wood.

60 Mount Auburn Street, Cambridge, February 21, 1875.

[The little harbor of Spizza is Turkish, so is Klek, further north, where the Turkish territory cuts right through the Austrian to the water's edge; and so, further south, is Antivari. These are all, as we said, "on the little strip of territory which cuts the Montenegrins off from the water," and are all, we believe, literally within sight from the mountains. It cannot be called a fact "that the territory lying between Montenegro and the sea belongs to Austria." The correct expression is that it belongs *chiefly* to Austria. The Montenegrin access to the water would, besides the port of Cattaro, naturally be, for topographical reasons, southward over Turkish soil, along the banks of Scutari Lake.—Ed. Nation.]

## A HINT TO BORROWERS OF THE NATION.

To the Editor of The Nation:

Sir: Will you accord me a little space to say that I am a constant reader of the *Nation*, and pay for it by the year? I desire to speak of a class of your readers—a very large and intelligent class—who neither *buy it* by the year nor by the copy. Your circulation is put down, I believe, at ten thousand copies weekly, whereas from my experience and observation I am satisfied that the ten thousand copies are read every week by not less than forty or fifty thousand families. In my town, a small one, for example, only two copies are taken, but not less than a dozen families enjoy the reading of it every week. It is passed around as one may suppose the Boston *News-Letter* was, April 24, 1704, when it first appeared, the pioneer of American newspapers—a scanty edition, eagerly sought.

My *Nation* goes around and returns badly soiled and in tatters. *I* do not complain of this. I am always glad to have a book or paper *worth borrowing*. But it is unfair to the publishers of the *Nation*. The point I desire to make in your columns by this brief communication is that if all the readers of the *Nation* were *bonâ-fide* subscribers (and there is no reason why they should not be), your circulation, instead of ten thousand, would be to-day not less than forty or fifty thousand.

Respectfully,

Private Dalzell.

Caldwell, Ohio, February 15, 1875.

# Notes.

Scribner, Armstrong & Co. will publish next month 'Religion and Science in their Relation to Philosophy,' by Charles W. Shields, D.D., of Princeton College.——Macmillan & Co. announce for March 1 a special American edition of 'Reminiscences from the Diary of Macready,' with four portraits by the admirable artist Jeens.——'Fu-sang; or, The Discovery of America by Chinese Buddhist Priests in the Fifth Century,' is a compilation by Charles G. Leland from various authorities. It will be published shortly by J. W. Bouton.——E. P. Dutton & Co. and Robert Clarke & Co., are respectively the New York and Cincinnati agents for the sale of the new 'Encyclopædia Britannica,' of which Little, Brown & Co., Boston,

are the general agents.——Prof. C. H. Hitchcock's geological and mineralogical survey of New Hampshire is to be published by E. C. Eastman, Concord, in two volumes of text, royal 8vo, and an atlas containing plates 26x36 inches in size. It was the author's intention to give a panoramic view of all the peaks visible from the summit of Mt. Washington, by means of photography. We do not know whether it has been carried out.——Zell's 'United States Business Directory' for 1875 is the most successful work of the kind yet undertaken in this country, and answers a general want. The editor is Dr. Colange. In one great volume of 1,848 pp. are comprised classified business indexes for all the United States; less fully for the Dominion of Canada; and more briefly still for London and Paris and the provincial cities of England. In future editions a great extension of this foreign directory is promised.——Francis Parkman's 'Pioneers of France in the New World' has been translated into French by the Countess Gédeon de Clermont-Tonnerre (Paris: Didier; New York: F. W. Christern). The version is a little free, and by omissions sometimes fails to do justice to Mr. Parkman's picturesque style; but, so far as we have examined it, it deserves praise for its correctness and cleverness. We notice in the title to Chap. XIV. a slight confusion of shades: "The Great War-Party" is rendered "L'Armée de la Grande Guerre." The volume, from being octavo in the original, is made a very attractive duodecimo, which leads us to wish, as in the case of the Italian edition of Mr. Marsh's 'Man and Nature,' that we had a popular American edition of equal beauty and handiness.——An Italian version by G. Carraro of Hallam's 'Middle Ages' (Smith's edition) has been lately published in Florence. But one other was ever made, that of M. Leoni, after the first English edition; and it was *poco commendevole*.——Very successful efforts have been made to restore Independence Hall, Philadelphia, to its pre-Revolutionary condition, and it has been converted into a National Museum "as a perpetual monument to the founders of America." A large and valuable collection of portraits and relics has been already formed, and the Board of Managers request additions either as gifts or as loans. The secretary of the board is Mrs. Samuel Chew, Germantown, Pa.

—The Report upon Rapid Transit and Terminal Freight Facilities presented to the American Society of Civil Engineers three weeks ago by the committee appointed to investigate these subjects, has now been issued in pamphlet form. It is a very carefully prepared document, devoted to a general consideration of these two important questions, and nowhere tainted by marks of partiality for particular schemes. The two subjects are taken up separately, Rapid Transit being first considered:

"1st. In order to be profitable with the fares and volume of business likely to be obtained, double-tracked rapid-transit roads should not cost, fully equipped, much, if any, more than from $700,000 to $1,125,000 per mile, according to location; and this points to some form of elevated railroad as the leading feature of the design to be recommended.

"2d. The right of way must be given to them, over streets selected for that purpose, and they should be operated by locomotives and by cars of somewhat different construction from those in use in this country, made very much lighter than ordinary rolling-stock.

"3d. The character of the structure carrying the roads should vary with the location, so as to adapt itself to the local circumstances of each case. No one single plan is likely to prove applicable over all parts of the city. . . .

"4th. There should presently be two roads, one on the east and another on the west side of Central Park, to be eventually complemented by one additional road on each side. The latter may be along the water-front.

"5th. Another effort should be made to induce private capital to build them. If this fails, they might be taken up by the city and built as municipal works."

—The second part of the Report is devoted to the methods of receiving, handling, and storing goods at the port and city of New York. Though the subject is one which has now a small hold on public attention compared with that exercised by rapid transit, we cannot but regard this as very much the most valuable part of the Report. The shameful condition of the water-front of New York, the inconvenient location of its storage warehouses, and the unnecessary expenses attending the cartage and lighterage of goods, impose a terminal tax on the business of the city of surprising magnitude. On 4,631,700 tons of domestic produce received at the port of New York in 1873, the average terminal charges amounted to over three dollars a ton, or more than three-fifths of the freight from Chicago, while it is estimated that the actual cost of cartage alone amounted to an average of $1 60 on every ton carted. At the other Atlantic ports the corresponding charges are but small. Goods arrive at New York for three purposes: 1st, local consumption; 2d, immediate export; and, 3d, distribution or eventual export. It is on the third class that the terminal charges bear most oppressively; and the Report suggests, as methods of relief, the construction of large storage warehouses, in which goods can be deposited immediately on their arrival with the least possible handling, these warehouses to be erected at the termini of the several railroads and along the water-front of the city—the recommendation being made that 100 feet of the 250-foot street laid out by the Dock Commissioners along the North River be devoted to this purpose; and a surface railroad along the water-front, with abundant side-track room, connecting with the railroads leading from the city of New York, and connected with transfer ferry slips at suitable points, by which the cars from railroads terminating at Jersey City and other points near New York could conveniently be received. Goods arriving in the city would be stored at once in the warehouses until the time arrived for their consumption or distribution, thereby saving one cartage or lighterage, while in their first distribution the convenience of the surface freight-tracks would greatly reduce the cost of handling. The Report is understood to be in a large degree the work of Mr. O. Chanute, the chairman of the committee. Like other papers prepared by him on kindred subjects, it is largely a statistical work, and contains a great amount of information of little less value to those who dissent from its conclusions than to those who accept them. The same may be said of the tables in the appendix on "The Elements of Success of a Rapid-Transit Railroad," which is contributed by Mr. M. N. Forney, a member of the committee. There are some respects in which we are not inclined to accept the conclusions of the Report, most notably perhaps the manner of estimating traffic, the ascribing greater value to a road on the East than on the West side of the city, and some of the details of location proposed for the West-side line. But as a candid and disinterested examination of a subject now of great interest to the whole city, it is certainly a work of great value, and deserves the careful perusal of our citizens.

—Mr. John Bigelow concludes in the current number of *Harper's Monthly* his papers on De Witt Clinton, which throw a good deal of light on the earlier politics of the country and on the character of Clinton himself. That we owe the New York canals, and thereby not merely a great deal of jobbery and corruption, but also the commercial supremacy of this city, to the sagacity of Clinton, is not to be denied, even by those who, with Mr. Bigelow, are disinclined to be laudatory of time past at the expense of the present. The articles contain voluminous extracts from a confidential correspondence with Mr. Post; and the picture given of the rage and fury of New York politics, of the wonderful ramifications of intrigue all over the country, the extraordinary range and richness of the vocabulary of vituperation, and the mastery in the art of blackening character evinced by Clinton, is far from edifying. "With the quiet instinct of an insatiable ambition," Mr. Bigelow says, "Clinton early discerned in Van Buren his most formidable competitor for political leadership in the State of New York," and so between the years 1817 and 1824 "nearly every letter to Post contains some vituperative allusion to Van Buren," as "arch-scoundrel," "Prince of Villains," "confirmed knave," "scoundrel of the first magnitude," also charging him with a "corrupt sale of the vote of the State," and still more insidiously with having paid the rent of a certain Mrs. M—— "when under distress." As a good instance of the method employed by Clinton to get his enemies out of his path, we may quote a letter to Post dated August 30, 1822:

"My Dear Sir: Since writing my last, a rumor which has been insinuated to the disadvantage of Van Buren has been embodied in a tangible shape. On his way to the West, the back seat (to which he had a claim) was occupied by Gen. Breckinridge of Virginia, the uncle of Mr. Porter, formerly a member of Congress—a man of character and decided courage—with two ladies. V. B., considering him a plain countryman, as his looks would indicate, patted him with his cane and demanded his seat. This was indignantly refused, and on Duer's announcing him as a senator, the Gen. stated that he was sorry the State of N. Y. was disgraced in being represented by a blackguard. The next stage produced a challenge, which V. B. declined, and he must either crouch or be whipped. So goes the report, probably exaggerated, but in substance correct; and this humiliation may account for his evident embarrassment and distress of physiognomy when I have seen him. Of his cowardice there can be no doubt. He is lowering daily in public opinion, and is emphatically a corrupt scoundrel."

We must not forget to add, however, that when the Erie Canal was before the New York Legislature, Van Buren made his great speech of the session in favor of the bill, whereupon Clinton, "breaking through that reserve which political collisions had created, approached him and expressed his thanks for his exertions in the most flattering terms."

—From this it would seem that the same system of "amenities" afterwards brought to such a high state of perfection by a certain class of editors, prevailed at that day among the politicians. But the custom of duelling certainly gave a reality then to most quarrels which makes them more interesting, from a purely human point of view, than the "contro-

versies" and "issues of veracity" of the present time. It was quite a serious thing to call a man in public "a liar, a scoundrel, and a villain" when the gentleman who was so vituperated might at once summon you to the duelling-ground at Weehawken, on the other side of the river, and force you to give him satisfaction. The epithets we have quoted were in fact applied by Mr. Clinton to Mr. John Swartwout in the year 1802, and were followed by a meeting, in which no less than five shots were fired on each side, two of them lodging themselves in Mr. Swartwout's left leg, and all this notwithstanding that Clinton had "no unkind feelings whatever" for Swartwout, his real enemy being Burr. Among other curious things in these papers is to be found a sort of recipe for the denigration of character, which is a valuable and novel contribution to political science. Mr. Clay had been charged with having "sold his influence" in Congress to Mr. Adams, and James Buchanan had been designated by General Jackson as one who could testify to the fact. Of course Buchanan could do nothing of the kind, and Clinton writes to his friend Post that "the affair had been badly manœuvred," and proceeds to inform his correspondent that the charge of corruption ought to have been proved, not by "the evidence of an accomplice," which is "rarely worthy of credit," but by accumulated evidence, which he sums up as follows :

"1. The known habits of the parties.
"2. An arrangement for their mutual benefit ; and,
"3. This in opposition to C.'s constituents, his interests, and Western popularity.
"4. In opposition to the opinions of Adams's best friends.
"5. The silence of Clay for a long time.
"6. His imputed advances to General Jackson.
"7. The known irregularities of his conduct, and the selfishness of Adams.
"8. The profligate men associated in the corrupted East and West";

and adds, "It appears to me that no other evidence is wanted but the circumstances of the case."

—Mr. G. P. Marsh, in his lectures on the English language, has some interesting statements as to the extent of the vocabulary commanded by different persons. Out of the (roughly) 100,000 words in English, he holds that "few writers or speakers use as many as 10,000 ; ordinary persons of fair intelligence not above 3,000 or 4,000," and so on. A Washington gentleman, Prof. Holden of the National Observatory, has lately read before the Philosophical Society of that city a paper giving the results of an enquiry into the extent of his own personal stock of words. By a sufficient actual count in various parts of a Webster's Dictionary, and a careful estimate of the rest, he finds himself in command of over 30,000 words ; and he regards this as a very moderate, even low, estimate, having found that other gentlemen in Washington count larger numbers than himself in parts of the Dictionary chosen for comparison. His paper gave a full account of the method he pursued, which seems to have been entirely trustworthy. It may be assumed, then, that the English vocabulary, ready for use, of a highly educated man, is above 30,000 words, and perhaps ranging up to 50,000. This is not necessarily in essential discordance with Mr. Marsh's statement, since a man may never have occasion to use by any means all the words which he perfectly understands when he meets with them in reading, and could, if occasion were, employ correctly. Prof. Holden, however, finds fault with the current estimates of Shakspere's and Milton's vocabularies, counting in the Clarke concordance of Shakspere some 24,000 words, instead of the 15,000 usually attributed to him, and in Milton's poems 17,000, instead of 7,000–8,000. It would be interesting on these points to have the results of other independent estimates. In the English Bible he finds, exclusive of proper names, a little over 7,000 words.

—We learn from Germany that the St. Petersburg Sanskrit Dictionary, which has absorbed the time and energies of its two learned editors, Professors Böhtlingk and Roth, now for nearly twenty-five years, is completely finished in manuscript in their hands, the printing also being advanced well into the very last letter, so that the concluding part is certain to appear early in the summer. Professor Roth gave, at the meeting of the German Oriental Society last autumn, an account of the gigantic work, which was received with enthusiasm, and the Society passed a vote of thanks to the editors and to all their collaborators, specifying by name among the latter Professor Weber of Berlin, and Professor Whitney of New Haven. Professor Roth will now probably turn a part of his attention anew to the Atharva-Veda, of which he is stated to have received recently from Kashmere a new and exceedingly important manuscript, containing a very different text from that published in Germany twenty years ago.

—The controversy between Professors Max Müller of Oxford and W. D. Whitney of Yale, over the relation of language to the development theory, is not without interest and amusement to bystanders. Our readers will remember that something more than a year ago Prof. Müller printed in *Fraser* three lectures on "Mr. Darwin's Philosophy of Language," and that in the *North American* of last July Prof. Whitney answered him at some length. Mr. George Darwin, in the *Contemporary* for November, introduced Prof. Whitney's argument to English readers, and now Prof. Müller, in the January number, has answered it in a manner that will probably end the discussion. The substance of Prof. Müller's argument was that language, and the general ideas to which language gives expression, and the Kantian forms of thought in which those ideas are framed, are found in all men and in no animals. These three things only exist together ; and it is not merely true that no sign of either exists in any animal, but further, the development of them could never take place in brute creation, because an animal acquiring them would no longer be a brute, while a man losing them would cease to be a man—which seems a revival of the old fallacy of motion, that a thing cannot move where it is, and cannot move where it not, and hence cannot move at all. The theory that there was an intermediate series of forms of which no trace has yet been discovered, in which by slow degrees those marks developed, the Professor rejected summarily. His proof that these marks do not exist in animals was hardly conclusive. His position required positive evidence that no animal has those marks, but his proof was merely negative—that we cannot tell whether they have or not, but that there is no sufficient reason to think that they have. Yet even this position he abandons. The arguments by which he proved Kant's forms of thought in man applied equally well to animals ; and he even confessed that the lowest mollusc, capable of voluntary action, might well be believed to will those actions under the categories of Kant. His treatment of general ideas is not more satisfactory. He obviously confused general and abstract ideas, between which, in this point of view, the difference is most important. General ideas, or concepts denoting a number of objects (for example, *dog*), are easily formed and realized in the imagination by calling up the image of some one or more of the individuals denoted. Abstract ideas (like doggedness), on the other hand, having only connotation—that is, designating not individuals but qualities separated in the mind from the individuals in whom alone they actually exist—cannot be represented in the imagination, and most probably could not be employed in thought to any considerable extent without the use of verbal symbols. The evidence that animals have general ideas is overwhelming, and, if we understand aright Prof. Müller's admission that animals have "shrewdness, calculation, presence of mind, reasoning in the sense of weighing," he is of the same opinion, or would have been had the distinction occurred to him, and only means to deny to animals abstract ideas. Unfortunately for his argument, there is excellent reason to believe that abstract ideas are not possessed by the lowest races of men, and Müller's proof that they are is merely proof of general ideas. Indeed, it follows from his position as to the formation of roots that abstract ideas could not have been possessed by the earliest men. Thus both his mental marks fail, and his language mark goes as easily, for he does not mean by language mere imitative or interjectional sounds, but radical forms in which the denotation has become broad and indistinct, and the connotation sharply defined ; and he shows how these roots were slowly produced by men from interjections and imitations, after a long interval in which these interjections and imitations were the only means of verbal communication : so that man was long man without the mark that Müller thinks inseparable.

—Of course this argument was not likely to be treated as conclusive, and, indeed, English scientists seem to have thought it hardly worth answering. Professor Whitney's article, explaining the rise of forms of thought, general ideas, and radical language, and pointing out the weakness of Professor Müller's argument, with some minor fallacies entangled in it, was welcomed by Mr. George Darwin in an appreciative notice which met the indignant eye of the Oxford professor ; and he was out on the war-path at once, in full paint and feathers. His desire for slaughter was too great to allow him to wait to find Professor Whitney's review, and, coming across his lectures on language, published some six or eight years ago, he attacked them at once, and made bloody work with them. The general idea that we get is that, with the exception of some bits on the Semitic and American languages, those lectures are taken bodily from Professor Müller's own works, and differ from them principally in their popular form, their omission of reasoning, their blunders, and their "bold misrepresentations," "self-assertion," and "personal abuse." Professor Whitney, we learn (by ingenious quotation from the scurrilous pamphlet of another German assailant), is "a horrible humbug," a "tricky attorney," whose arrogant vanity yawns and grins in the face of the reader, etc., etc. A thin veil of moderation and candor is cleverly thrown over the whole essay. Remembering the

courtesy of Professor Whitney's review, and the staid tone of the magazine in which it was published, it is amusing enough to read that "it is both interesting and instructive, in the study of Dialectic Growth, to see how words which would be considered offensive in England have ceased to be so on the other side of the Atlantic, and are admitted into the most respectable of American reviews." Small space is accorded by Professor Müller to reasoning in his reply; his scorn is too intense for that. He explains with more or less success some of Mr. Darwin's minor points, but naturally finds difficulty in answering the essay which he has never read; and he adds little or nothing to the main points of his argument, unless the very metaphysical theory with which he closes is to be so regarded. Abandoning the field of phenomena, to which Darwin and his followers confine themselves, he soars aloft to the ethereal region of final causes, and announces that in the unknown he and his opponents are at one again; and there evolves an *à priori* theory of development, in which, of course, natural selection plays no part.

—To the many memorials of Agassiz an interesting one is added by his compatriot De Candolle, who is, by the way, his successor as one of the immortal eight in the French Academy of Sciences. As president of the Geneva Society, De Candolle made the annual report for 1873–4, in which he renders honor to the memory of his fellow-citizen De la Rive, and of Quetelet as well as of Agassiz, not to speak of less distinguished names. The notice of Agassiz is full of interest. It gives—through his correspondence with Coulon of Neufchâtel, and of the latter with Humboldt—some particulars of his life in Paris in 1832, the year in which Cuvier suddenly died, shortly after he had recognized the young naturalist's genius and opened the way for its development in Paris; and it shows that he, both before and after Cuvier's death, turned away from the flattering prospects there presented and sought instead the modest professorship at the Lycée of Neufchâtel which Coulon founded for him. "Je suis trop peu français par caractère," writes Agassiz, and he proceeds to say that he is not seeking the place for any personal advantage, but that he shall bestow upon the establishment all the means that come into his hands. De Candolle notes this avoidance of great cities as a characteristic trait; that he preferred Neufchâtel to Paris, avoided Berlin and London, where he had powerful friends, and, in America, preferred Cambridge to New York or even Boston. We should note also the early development of a disposition to found, to sow for himself and for posterity, rather than to fall back upon garnered stores, however ample. De Candolle refers with admiring wonder to "des dons fabuleux des riches Américains," and to the large sums given for the support of the Museum of Comparative Zoölogy, both before Agassiz's death and in the *testimonial* since. He adds: "Si dans le temps où Agassiz n'était qu'un étudiant pauvre, il a rêvé un Eldorado approprié à sa passion pour l'histoire naturelle, son rêve s'est réalisé plus d'une fois à la fin de sa vie." We add one more sentence in translation; for the official judgment of so thoughtful and prudent a naturalist as De Candolle is worth recording:

"Agassiz taught in three languages, with the same grace and the same facility. He belonged to no school. Science to him was neither German, nor French, nor English, but of all countries. He excelled in the examination of details and in the comparison of forms. [In other words, he was an unrivalled morphologist.] I could not say that he was equally great in the principles of natural classification and in theoretic deduction. It is at least singular that the author of the immense discovery of the parallelism between the successive forms of the embryo of a fish and of the successive forms of the class of fishes in general, through geological times, should obstinately deny all evolution in the animal and vegetable kingdoms."

—We may appropriately place beside this passage an extract from Dr. Asa Gray's feeling address on the late Jeffries Wyman, before the Boston Society of Natural History, last October. It will be found on page 36 of the memorial pamphlet. The speaker had had a conversation with Wyman some time after the death of Agassiz, and not long before his (Wyman's) own:

"Agassiz repeated to me, he said, a remark made to him by Humboldt, to the effect that Cuvier made a great mistake, and missed a great opportunity, when he took the side he did in the famous controversy with Geoffroy St. Hilaire; he should have accepted the doctrines of morphology, and brought his vast knowledge of comparative anatomy and zoölogy, and his unequalled powers, to their illustration. Had he done so, instead of gaining by his superior knowledge some temporary and doubtful victories in a lost cause, his pre-eminence for all our time would have been assured and complete. I thought, continued Wyman, that there was a parallel case before me—that if Agassiz had brought his vast stores of knowledge in zoölogy, embryology, and palæontology, his genius for morphology, and all his quickness of apprehension and fertility in illustration, to the elucidation and support of the doctrine of the progressive development of species, science in our day would have gained much, some grave misunderstandings been earlier rectified, and the permanent fame of Agassiz been placed on a broader and higher basis even than it is now."

—"A Prussian," taking exception to our remarks on the late postal-vocabulary changes in Germany, sends us the Postmaster-General's reply to a similar criticism in the Dresden *Nachrichten*. That paper had urged that "poste-restante," "recommandirt," "express," etc., were now part of the world's currency, and that to suppress them in favor of German words was, internationally considered, a step backwards. The force of this argument is weakened but not wholly removed by Dr. Stephan when he shows, for instance, that for "poste-restante" the English and Americans use "to be called for"; the Danes and Norwegians "til afhenting" (till taken away); the Spaniards and Portuguese "lista"; the Italians, "ferma in posta." This is all very true, and if Germany prefers a phrase of its own, and the word *postlagernd* meets with favor, there is nothing to be said. Nevertheless, the *Nachrichten* was right in its main position, that in all civilized countries the post-office officials know what *poste-restante* means, and that (Germany not excepted) they will all have to learn what *postlagernd* means. Doubtless, however, the phrase in question is the best example of universal usage or intelligibility that can be cited, and perhaps it ought not to have been allowed to stand in the way of an attempt at national (and not international) uniformity. Still, the Germans themselves, no less than foreigners residing or travelling abroad, have been amazed at the long list of changes ordered by Dr. Stephan. They smilingly replace the old-time *couvert* (which, oddly enough, is not the usual French word for envelope) with *Briefumschlag*. Indeed, the Berlin *Wespen* declares that the Postmaster-General gave a New Year's dinner of 40 *Umschläge*. When we characterized the new-fangled *postlagernd* as "barbarous," we perhaps spoke with greater freedom than discretion. All the changes were made after a very thorough conference on the part of the post-office officials, and it is proper to be modest in face of their deliberate approval. Dr. Daniel Sanders, too, the eminent lexicographer, has in the *National-Zeitung* of Berlin warmly commended the new vocabulary, and suggested the introduction of *drahten* and *kabeln* (like our commercial verbs *wire* and *cable*).

—It is a pleasant indication of the progress which the study of comparative mythology is making throughout Europe, and of the part taken in it by Italian scholars, that Professor De Gubernatis has just published at Florence, in the form of one of those handy "*4 lire*" volumes which bespeak a wide popular circulation, a series of 'Lectures on the Vedic Mythology.' The style and quality of this author are well known in America by his 'Animal Mythology' and his contributions to the *International Review*. He is a venturesome and constructive etymologist and mythologist, and many of his suggestions and combinations may fail to receive the final assent of the community of scholars; but his enterprise and fertility in this department are not on that account any the less to be commended. We wish the volume might appear in an English dress, either on this or the other side of the ocean.

## FISKE'S COSMIC PHILOSOPHY.*

MR. HERBERT SPENCER'S philosophy has been much praised, but little understood, as was lately shown by the surprise and misunderstanding that greeted Mr. Tyndall when in his Belfast address he gave to it the weight of his own authority. The slight attention which Spencer gave to the old ontological questions of Infinite and Absolute, Noumenon and Final Cause, had something to do with this; the voluminousness of his works deterred many; and his very fertility in brilliant suggestion and vivid illustration, while exhibiting details in a very effective light, obscured the outlines of his theory, and enrolled many among his converts before they had learnt his doctrines. Further explanation was much needed, and probably this could best be given by another mind; for, as an artist can sometimes best judge his work by its reflection in the glass, so a philosophical scheme can often be better judged in its reproduction than in its original presentation. And Mr. Fiske seems well fitted for this work, his mind being evidently very receptive in the best sense. He not only fully absorbs Spencer's views, but he rearranges, condenses, and completes them. If he is at times a little too easily acquiescent, or too timid in original criticism, it is a perhaps not unpardonable fault in what hardly pretends to be more than an exposition of another's views.

The new philosophy includes in its scope the laws of the whole phenomenal universe or cosmos; but the subject-matter is limited by the exclusion of all ontological questions as insoluble, thus following the path marked out

*'Outlines of Cosmic Philosophy, based on the Doctrine of Evolution, with Criticisms on the Positive Philosophy. By John Fiske, M.A., etc.' In two volumes. Boston: James R. Osgood & Co. 1875.

in Spencer's published programme, and "carrying a step further the doctrine put into shape by Hamilton and Mansel." There is something more than a mere step in advance, however. Both Spencer and Hamilton start from the same supposed contradictions, and arrive at the same result, in the establishment of the unknowable ; but their paths are different. Hamilton unconsciously accords a greater validity to the laws of the cognitive than to the laws of the representative faculty, and holds himself logically bound to accept what he cannot realize to himself as true. Spencer seems to regard the laws of thought as no more imperative than those of the imagination, and decides, upon the same evidence, not that the inconceivable must be true, but that we know nothing about it. He brings it back into consciousness, however, in obedience to an inexplicable instinct which he cannot disobey, and makes this undemonstrable belief in a shapeless unknown the corner-stone of his philosophy. Of course this philosophy, like every other system founded on ignorance, must be subject to revision whenever any new light is thrown upon the matter. Since it appeared, J. S. Mill has reviewed the whole ground and removed much confusion, and his work was done so thoroughly that it was a permanent addition to philosophy. We do not think Mr. Fiske has sufficiently considered the changed aspect that these antinomies now wear. A detailed consideration of them is impossible here, and we can only advise the student to analyze them in Mill's method. The problem will then, we think, assume a very different aspect. The difficulty of picturing in the imagination the primary elements of knowledge will remain, but the necessity of accepting an unthinkable conclusion will vanish.

The truth is that Mr. Fiske includes in his Unknowable several very dissimilar things. He puts all the unintelligible and self-contradictory abstractions created by metaphysicians, together with those genuine abstractions which, though intelligible, cannot be adequately imaged in the mind ; adds to them certain elementary concepts of the external world which represent real existences too little known to be fully understood, and certain associations so firmly fixed that to dissociate their elements seems to break the whole chain of thought ; and, combining with the whole the idea of a noumenon and of a final cause, styles it the Unknowable, with a capital U. It would be a mistake, however, to treat this Unknowable as a mere bundle of heterogeneous abstractions ; for what Mr. Fiske usually means by that word is the last element only. The Cosmic Unknowable is the infinite and absolute substance of Spinoza and Hegel, the "Reality of Realities," "unknowable so far as infinite and absolute, knowable in the order of its phenomenal manifestations." But the disuse of the established nomenclature, and the employment of one of the most indefinite of words in a shifting meaning, misleads the student and hinders his recognition of the true character of this unknowable Reality.

One of the distinguishing features of Cosmism is its doctrine as to the external world. Spencer asserts plainly that there is an objective reality, though he does not agree with Hamilton that we are directly conscious of it phenomenally. But whether that objective reality is phenomenal, or whether it is simply the unknowable, it is not so easy to ascertain from his writings. Mr. Fiske is more explicit. He says (i. 80), "We admit that matter does not exist *as matter*, save in relation to our intelligence. . . . But we nevertheless maintain in opposition to the idealist [the cosmothetic ?] that *something* is still there," namely, an "unknown Reality which caused in us these groups of sensations." This unknown and unknowable Reality we must believe to be a single and absolute being, "because we cannot think without doing so." We regret our inability to quote Mr. Fiske's argument at length, but we think that these extracts show his real views, although the reader will find certain expressions apparently in conflict with them. Mr. Fiske's universe thus consists of mental phenomena and an unknowable noumenon.

Comparing Mr. Fiske with other thinkers, we find that he differs from Hamilton in denying external phenomena. In this he agrees with Mill, but he differs from him in asserting noumenal reality. In this he agrees with Berkeley, but from him he differs in denying the personal character of this reality and holding it altogether unknowable. In Hamilton's classification he is of the genus substantialist, as asserting a real substance, and species monist, as affirming the unity of phenomena. Like all the subdivisions of this species, his theory is a form of Idealism, as he seems himself prepared to admit (ii. 446). Materialism, which Hamilton places in this group, is really a subdivision of Nihilism, at the other end of the scale, where Positivism also belongs. Mr. Fiske's analysis of the relation of Cosmism to Positivism on the one hand and Idealism on the other shows much knowledge ; but it is injured by his failure to see that a belief in external phenomena is usually a part of the former, and a belief in noumenal reality almost invariably a part of the other.

The only phenomena which he recognizes being of the mind, of course the "test of inconceivability is the only ultimate test of truth which philosophy can accept as valid." Here the distinction between Monism and Dualism is imperative. Dualism, acknowledging external phenomena, is obliged to employ a double test of truth. It is not enough that its reasoning should be logical ; the precepts which that reasoning analyzes and recombines must also be true to the phenomena which they represent. But Cosmism is partially free from this restraint, inconceivability being its only limitation. Mr. Fiske is generally too clear a thinker to profit by this freedom, and although his theory is of the Idealists, his method is of the Positivists. Indeed, for practical use, he finds the subjective method of very little value, and in introducing his synthesis he explicitly abandons it (i. 272), saying that "the truth of any proposition for scientific purposes is determined by its agreement with observed phenomena, and not by its congruity with some assumed metaphysical basis." The foundation of Cosmism is, nevertheless, essentially subjective, though, curiously enough, Mr. Fiske does not seem aware of it, and attacks the subjective method with as much vigor as if he himself never employed it. In his main synthesis he seeks to establish the law of evolution inductively. But his proof of the existence of the Unknowable, his adoption of the test of conceivability, his argument for the law of causation and the law of conservation of force, are all subjective. Upon the last two he rests the law of evolution, and his proof is far from satisfactory, apparently involving a fallacious use of zero factors. He says (i. 148 and compare i. 258 :)

"Our belief in the necessity and universality of causation is the belief that every manifestation of force must be preceded and succeeded by some equivalent manifestation. Or in an ultimate analysis it is the belief that force, as manifested to our consciousness, can neither arise out of nothing nor lapse into nothing, can neither be created nor annihilated. And the negation of this belief is unthinkable ; since to think it would be to perform the impossible task of establishing in thought an equation between something and nothing."

This is his proof of the invariability of causation. No doubt, if there is an invariable equation between antecedent and consequent, the law of conservation of force follows; but until that law was inductively established the existence of such an equation was the very question in issue. Mr. Fiske seems to think that because we are able to think of antecedent and consequent in relation to each other, there must be a mathematical relation of equality between them. Perhaps he means that we must think of every event as preceded by a cause, because otherwise we should think it preceded by nothing, and to think nothing is to stop thinking. But this is equally fallacious. The thought of a thing as without objective existence, or as disconnected with objective existences, is not nothing, and it may be a sound thought. His trouble seems to arise from his disbelief in objective phenomena ; but one would suppose that a writer who could show with Mr. Fiske's clearness the untrustworthiness of our belief in the occult power of a cause to produce its effect, would hardly have attempted to evolve from the effect its cause. His subjective method does not even harmonize the different parts of his system, for his test of truth by conceivability would destroy the belief in the Inconceivable upon which his system rests. It would seem a mere identical proposition that if inconceivability is the test of truth, the existence of the Inconceivable cannot be established as true. The reader will notice, too, how the Spencer theory that necessary thoughts are nothing more than the uniform experiences of our ancestors which long repetition has stamped ineffaceably on the brain, deprives the test by conceivability of nearly all its value. Putting the two theories together, it would seem that the beliefs of semi-barbarous ancestors are the sole test of truth. This results from the failure to distinguish between two kinds of inconceivability—namely, the inconceivability arising from long-repeated association of ideas, and the inconceivability arising under the law of contradiction. The first is, or may be, inherited ; but it is no test of truth. The second is a test of truth, but has nothing to do with inheritance.

The theories of Darwin and Tylor, Arnold and Maine, and others among the best of modern thinkers, adorn Mr. Fiske's work ; and he has done much more than merely present the thoughts of others. His most important suggestion, that of the influence of the long period of feeble adolescence upon man's social development, is, we think, a permanent contribution to the development theory. But much still remains to be done. A philosophy which gives us as its final generalization two laws, Evolution and Dissolution, both of universal application, one of which is in point blank opposition to the other, can hardly be regarded as completely finished ; and the figurative description of them as "rhythmic" only deludes us with an empty semblance of explanation. We fear that Mr. Fiske's treatment of this matter will not be found satisfactory. His readers will scarcely be willing to follow his example (i. 328) in devoting their attention solely to the

nothing for the present, provided he and his imagination can have the future all to themselves.

Mr. Raymond is now going about the country acting this part for the benefit of country audiences. We certainly hope he may have all the success he deserves. His Colonel Sellers is one of the few, the very few, American parts that have an actual, independent existence of their own. Go through tragedy, comedy (high and low), melodrama, and farce—adding, if that be necessary, the "supernatural" melodrama, the "emotional" and the "society" play—and in them all are there half-a-dozen characters, properly so-called, who represent any real thing in American life? At this moment the only ones which occur to us, after cudgelling our brains, are Solon Shingle, Rip Van Winkle (the interest in him, too, being half literary and half legendary), the atrocious Yankee in the "American Cousin," and Colonel Sellers. These characters are all in low comedy, or we might almost say broad farce. The list may be increased perhaps by the addition of a name or two, but it cannot be made long, and in any list Mr. Raymond's Colonel Sellers will hold a high place. It is an extremely nice piece of acting, and, though the character is not a high one in the dramatic scale, it is for that reason not the less difficult. The rôle of a speculator, a promoter of schemes, a penniless adventurer in Western lands, who should be at the same time noisy, vulgar, and disgusting in speech and action, would no doubt be within the reach of many actors; but the peculiarity of Colonel Sellers, as given by Mr. Raymond, is, that though he represents a kind of American peculiarly objectionable to our higher feelings, he yet succeeds in making the part an attractive one. We like our speculative friend, and we sympathize with his belief in the untold millions to be extracted from each new scheme that on the road to fortune is reducing him to beggary. We may doubt at times his perfect integrity, but we feel with him that ophthalmic experiments on pagan Oriental nations may fairly be excused if they tend to turn the balance of trade in favor of our own people. We are involuntarily pleased with the ex-rebel patriotism which glows at the thought of "The Old Flag—and an Appropriation." And, as the chain of speculative reasoning on which each new gigantic fortune rests is unrolled before our eyes, we admit the validity of any expectations. The play is worth seeing, if only to witness an American audience in thorough sympathy with an American actor. It is evident from the first act to the last that every one in the theatre is, in his own fashion, be it large or small, a speculator, and that he sees himself reflected from the stage.

## *The Reader.*

NEW VERSION OF LESSING'S 'LAOCOÖN,' BY SIR ROBERT PHILLIMORE.—TRANSLATION OF VON RANKE'S 'HISTORY OF ENGLAND.'

More than a century has passed without bringing forward a gem of critical art at all comparable with Lessing's Essay on the Laocoön. The Sainte-Beuve of Fine Arts, he proves in that exquisite bit of study his subtlety, patience, and research, bringing the light of history and the accumulations of reading to bear on a theme he already has by heart so far as its plastic motive goes. A new translation, including the whole of the notes, has been made by Sir Robert Phillimore, and issued by Macmillan & Co.

The 'Laocoön' was published in 1766, after the 'Nathan der Weise.' It was perhaps inspired by the great work of Winckelmann, whom Lessing treats with singular respect, even while distancing him in acumen and correcting him perforce in more than one interpretation of the Greek idea. In the 'Laocoön' are considered the limitations of sculpture and poetry respectively; the essay, in fact, is the query made by a literary man and scholar, who looks across the boundary of his own art of letters, with some disposition to envy the clear and obvious effects obtained by the plastic artist, and sets himself studiously at work to decide whether the chisel or the pen is after all more successful in treating a phase of life or a poetic situation. He arrives naturally at the conclusion that the literary artist has the privilege of portraying a sequence of events, while the sculptor or painter must seize the most telling instant, and to that instant confine himself. As Mr. Matthew Arnold, to whom Lessing's masterpiece has suggested an admirable poem, says of the artist:

> "In outward semblance he must give
> A moment's life of things that live;
> Then let him choose his moment well,
> With power divine his story tell!"

There is no limit to the number of distinguished thinkers who have acknowledged obligations to the 'Laocoön.' Every writer of art since it appeared has betrayed consciousness of its line of argument and marshalling of illustration. Fuseli introduced it in his lectures. Ruskin shows thoughtful acquaintance with it in his radical treatment of the episode in 'Virgil.' Macaulay actually said that he had learned more from it than he had ever learned elsewhere.

Lessing, after all, however, approaches the art of the Greeks as a man of letters, and not quite as a sculptor would do. In treating the problem whether the group is subsequent or not to 'Virgil,' he is at his best, showing wonderful knowledge of antique authors whom Virgil himself may possibly have followed. The critic of a century back saw a perfection in the group which the best criticism of our time can hardly see. Neither Lessing nor Winckelmann, perhaps, was conscious of the real head of the principal figure, believed to be preserved in a private gallery at Brussels; and they waste time in dwelling on parts of the group that really are restorations. But as a work of more than fair artistic judgment, combined with resplendent talent for illustration, the essay by Lessing holds its own against the profoundest of those later criticisms which succeed by using its method.

The present translation was completed, as Sir Robert Phillimore mentions, before he had seen the version by Miss Ellen Frothingham, published last year; and it has the advantage of including the unfinished parts, and of some excellent remarks by the English translator himself.

The great excellence of Leopold von Ranke as a historian is that he is logical, and not rhetorical. His complete impartiality has led to the strange fact of the acceptance of his 'History of the Popes' by the Catholics themselves. In the grand cycle of works which have occupied the life of this tireless historian, his 'History of England' may be looked upon as the capital performance; for the relations of England with France and Holland have determined the course of politics in Europe. His 'French History,' 'Life of Wallenstein,' 'History of the Thirty Years' War,' and minor works, while they demonstrated his curious industry, lead up to this central thread of European international relations.

The history closes with George II., and is mainly devoted to the seventeenth century, with a skilfully condensed study of previous movements in England from the earliest times. In general terms, says Von Ranke, the distinction between modern England and modern France is that the glory of their arms abroad has lain nearest to the heart of the French nation, and the legal settlement of their home affairs to that of the English: an excellent remark, embodying the motives of whole dynasties.

The eight volumes of the original have been translated by eight gentlemen connected with the University of Oxford, and reissued in five volumes. The appendices are rich with criticisms on the chief contemporary writers of the period, and with hitherto unpublished documents. The work is conceived in a spirit of the broadest philosophy and international justice.

### NEW BOOKS.

*L. VON RANKE'S HISTORY OF* England, principally in the Seventeenth Century. Translated from the German. 6 vols. 8vo, $24.

*LAOCOÖN:* Translated from the Text of Lessing. With Preface and Notes by the Rt. Hon. Sir Robert J. Phillimore, D.C.L. With Photographs. 8vo, $4.

*THE METHODS OF ETHICS.* By Henry Sidgwick, M.A., late Fellow of Trinity College, Cambridge. 8vo, $4.

"This excellent and very welcome volume. . . . Leaving to metaphysicians any further discussions that may be needed respecting the already overdiscussed problem of the origin of the moral faculty, he takes it for granted as readily as the geometrician takes space for granted, or the physicist the existence of matter. But he takes little else for granted, and defining ethics as 'the science of conduct,' he carefully examines, not the various ethical systems that have been propounded by Aristotle and Aristotle's followers downwards, but the principles upon which, so far as they confine themselves to the strict province of ethics, they are based."—*Athenæum.*

*SELECTIONS FROM BERKE-* ley. With Introduction and Notes for the use of Students in the Universities. By Professor Fraser, LL.D., etc., Edinburgh. Crown 8vo, $3.

*CHRIST AND OTHER MASTERS.* A Historical Enquiry into some of the Chief Parallelisms and Contrasts between Christianity and the Religious Systems of the Ancient World. By the late Ven. Archdeacon Hardwick. Edited, with Memoir, by the Rev. F. Procter, M.A. Third Edition, in one volume crown 8vo, $3.

"Probably no work has ever appeared upon the subject more thorough and scholarly and sound than that prepared and put forth by Archdeacon Hardwick. It shows the true position of Christianity in relation to other religions—not all of them, it is true, but those which have already received the allegiance of such large numbers as to merit the honor of being considered representative systems. . . . We have, therefore, always considered this work of Archdeacon Hardwick as especially satisfactory—one which, because of its thoroughness in plan and execution, will never lose its value."—*The Churchman.*

*A SHORT HISTORY OF THE* English People. By J. R. Green, M.A., Examiner in the School of Modern History at Oxford. With Genealogical and Chronological Tables, and Colored Maps. Crown 8vo, $2.

"I think Mr. Green's 'Short History of the English People' admirably suited for students in the universities and for higher classes in schools. The object of the book, that of combining the history of the people with the history of the kingdom, is most successfully carried out, especially in the earlier part. It gives, I think, in the main, a true and accurate picture of the general course of English history. It displays throughout a firm hold on the subject, and a singularly wide range of thought and sympathy. As a composition, too, the book is clear, forcible, and brilliant. It is the most truly original book of the kind that I ever saw."—*Extract from a letter of Edward A. Freeman, D.C.L., etc., author of 'The History of the Norman Conquest of England.'*

### NEW BOOKS.

*SCANDINAVIAN HISTORY.* By Elise C. Otlé. With Maps. Globe 8vo, $2 50.

*TALES IN POLITICAL ECON-* omy. By Millicent Garrett Fawcett. Globe 8vo, $1.

*THE THREE DEVILS,* Luther's, Milton's, Goethe's. With other Essays. By David Masson, LL.D., Professor of Rhetoric and English Literature in the University of Edinburgh. Crown 8vo, $1 75.

*BRITISH WILD FLOWERS,* considered in Relation to Insects. By Sir John Lubbock, Bart., M.P., F.R.S., etc. With numerous Illustrations. Crown 8vo, $1 50. ('Nature Series.')

*MILTON'S POETICAL WORKS.* Edited, with Introduction, Notes, and an Essay on Milton's English, by David Masson, LL.D., Professor of English Literature and Rhetoric in the University of Edinburgh. With three Portraits, engraved on Steel by C. H. Jeens and Radclyffe. 3 vols. 8vo, cloth, $15.

*MILTON'S POETICAL WORKS.* (Golden Treasury Edition.) With Introduction, Notes, and Memoir, by Professor Masson. With two Portraits engraved by Jeens. 2 vols. 18mo, $3.

*A RAMBLE ROUND THE* World. By M. le Baron de Hübner, formerly Ambassador and Minister, and author of 'Sixte Quint.' Translated by Lady Herbert. 12mo, cloth extra, $2 50.

"One of the most interesting books of travel of the past year."—*Atlantic Monthly.*

*HISTORY OF THE LIFE-BOAT* and its Work. By Richard Lewis, of the Inner Temple, Barrister-at-Law, and Secretary of the Royal National Life-Boat Institution. With Illustrations. Crown 8vo, $1 75.

*GOVINDA SAMANTA;* or, The History of a Bengal Ráiyat. By the Rev. Lal Behari Day. Chinsurah, Bengal. 12mo, $1.

"Besides writing a novel of a perfectly original character, one which even the most *blasé* frequenter of the circulating library must acknowledge to be out of the common, he has contrived to give us an immense amount of information concerning the peasantry of Bengal."—*Morning Post.*

law of Evolution, leaving "the process of Dissolution entirely out of the account" as superfluous luggage, and then at the end (ii. 368) accept it as "proved that this eternal rhythm must of necessity be manifested in alternating eras, both general and local, of Evolution and Dissolution." The law of evolution is an interesting one. It may be that it can be established inductively, though the illustrations offered by Mr. Fiske are hardly sufficient; but the admitted existence behind of an opposing and seemingly irreconcilable law of dissolution leaves the matter in a very unsatisfactory state.

These defects of plan, if such they be, are only too easily lost sight of in the beauty of the details. Most of the minor arguments are admirably stated and forcibly illustrated. The summing up of Mr. Fiske's view of the free-will question (ii. 188) shows what excellent work he can do. In so large a collection of illustrative facts there could hardly fail to be some errors, but they are few. There is an occasional over-positiveness of assertion, against which the reader must be on his guard, due in part to Mr. Fiske's not sufficiently distinguishing between verifiable theories and hypotheses accepted merely as the best explanation offered of facts which must be arranged in some way to be of any use. And this misleads him also into accusing Hume and others of assuming positive knowledge in merely rejecting hypotheses.

In religion, Cosmism is not admittedly revolutionary. It (i. 184) "assigns to religion the same place which it has always occupied, and affirms that the religious sentiment must find satisfaction, in the future as in the past, in the recognition of a power which is beyond humanity and upon which humanity depends. The existence of God—denied by Atheism and ignored by Positivism—is the fundamental postulate upon which Cosmism bases its synthesis of scientific truths." The system of unselfish morality which the utilitarians have built up, Mr. Fiske has made his own, and he disclaims any "alteration in ethical values in the grand equation between duty and action" (ii. 453). But one thing Utilitarianism lacked—a sanction; and this Christianity, and Christianity alone, has given. The personal influence of the loving Father and awful Judge has for ages guided the race through its affections and its fears. And if that belief is to fade, we cannot but watch with anxiety the substitute that is offered; and the vague awe with which we turn to this impersonal, unchangeable, unknowable Essence of Cosmism seems but ill-fitted to replace the martyr-zeal of Christianity.

## RECENT NOVELS.*

A NEW novel by Mrs. Linton will doubtless be received with interest by a large body of readers already attracted to her by that remarkable work, 'Joshua Davidson.' We believe they will, for the most part, be disappointed in the character of this successor to the candidature for public favor which the former book so successfully assumed; but, for ourselves, we are not surprised at the shortcomings of 'Patricia Kemball.' The story by which this authoress gained her chief renown was excellently conceived and consistently carried out, but the imagination in it did not extend to a genuine grasping of individual character. Joshua, Mary, and the faithful friend were composed of simple and general human qualities conveyed by other vehicles than that of distinct personality. In the more recent book, we have deliberate characterization; but, though not discreditably weak, it is seldom strikingly vigorous, and almost invariably not engaging. Patricia's figure is sketched with strength and freshness; but, like all the rest, it lacks charm. The tale, which, though moderately interesting, is not especially noteworthy for anything but good moral and intellectual tendency, is developed by methods a good deal similar to those of Miss Austen—the same slow and systematic contrasts are observed, the same satire is employed. This satire is satire reduced to its simplest terms—offended common-sense. Unlike Miss Austen, the more sagacious female novelist of to-day does not halt at the threshold of crime, but rather takes pride in her ability to assist at the operations in moral surgery which now fall to the lot of most practitioners in fiction. We do not mean to hint that Mrs. Linton is offensive, as many of her sister novelists are; but an unpleasant clandestine marriage, forgery, murder, and a hanging, result in giving the story a sombre tone, perhaps not altogether healthy. The murderer, for example, it is said, "passed through life in the odor of respectability, beloved by none, known by none, bearing ever with him the consciousness of crime and the belief in his own eternal damnation, but bowed down to by all. Was he not . . . . the wealthiest man for miles around? Does the world ask more, or seek to know more, than this?" The progress of the catastrophe is crudely managed; and it is unsatisfactory to find Patricia's young lover, who parted with her at page 54, suddenly reappearing at page 473, qualified for the marriage that immediately takes place only by the statement that "he was no longer the mere boy, but a man," etc. It will be seen by the above numerals that the book is much too long; but it has the merit of sincerity as a protest against errors of social compromise.

As a novel directly illustrative of a principle, it is very far above Mr. Hale's hasty 'New Crusade.' Mr. Hale's theory of raising drunkards to a higher life is, in brief, that "you must give them somebody else to care for worse off than they are" (p. 74), and that this can be best attempted by social co-operation: "the best men and women can do just what they choose, if they will only work together" (p. 286). Undoubtedly he is at liberty to propose this solution, and there is undoubtedly much wisdom in it, though it would be hard to say how the lowest class of all is to be provided with protégés "worse off than themselves." But we must protest against the make-believe attractive tale in which he has attempted to embody his idea. It is a concession to the prevalent mania for practical illustration. Nothing more convenient to a preacher or lecturer than a good anecdote in point; but Mr. Hale, having none at hand, manufactures one, spins it out through nearly three hundred duodecimo pages, and presents it to us as a novel. Perhaps it is an inevitable consequence that the invention should be slight and bald, and the characters—whose commonplace names are one more point in evidence of the writer's fatal facility—thinly colored and tedious. But Mr. Hale should hardly have carried his inartistic consistency so far as to throw in, after an observation of his own in the character of novelist, the statement that "this remark will displease Mrs. Howe. Still, I commend it to her serious reflection." This bit of personal allusion is quite uncalled for, and is below even the assumed dignity of fiction in which the 'New Crusade' is attired. The story, however, is of a kind that Mr. Hale, disregarding his better abilities, has of late (as in his 'Civil Servant') shown rather too ready a disposition to condescend to; and it is perhaps not worth while attempting to invest it with an importance it can hardly lay claim to by further criticism.

The author of 'Progressive Petticoats' will not, we think, find any fame accruing to him, from this his latest venture, of a kind to be envied. The design of the work is singularly simple: a fictitious Mr. Gill, after some very flat and foolish introductory matter, proceeds to relate the events that preceded the birth of each of his several children. These events all concern the particular mania which took possession of his wife, in the particular interval before the birth of each child: now it is a mania for exactitude in accounts, now for Graham bread and beans, again for the water-cure, and so on. One has misgivings, now and then, that the writer meant to be satirical; but, after all, one is relieved to find how little ground there is for such a suspicion. The sub-title of the book is purely fraudulent. Nobody is "dressed to death" in the course of the narrative, and in fact the author displays a tendency to go to the opposite extreme of suggesting nudity. There are several passages of surprising coarseness in the volume; and we should be inclined to warn all readers against disturbing themselves by any chance glimpse of its pages but for our belief that few who would be susceptible to injury from it will go beyond the first paragraphs. Mr. Roosevelt should have contented himself with the laurels of 'Five Acres Too Much,' which, though perhaps slightly faded by this time, were earned by a more honest effort than he has here put forth.

"It is somewhat incomprehensible," says the writer of 'South Meadows,' "that the delusion of witchery, which carried such consternation into New England and desolated so many homes nearly two hundred years ago, should have received so little attention at the hands of . . . the writer of fiction." We feel bound to say, for our own part, that we do not find it at all incomprehensible, and this not because we think writers of fiction have been so surprisingly wanting in judgment as this author would imply; for "nearly two hundred years" they have been singularly fortunate, as a general thing, in avoiding a subject which really offers them very few advantages, and does not at all urgently demand their treatment. Without assuming that, if the occasion here offered to the romancer is really pressing, it would inevitably have been improved before now, we may still argue that a writer like Hawthorne would have been likely to seize such an opportunity if it had existed. That he made no attempt to seize it seems to imply the check of an artistic instinct quite in accord with what would be our own view on this point, viz., that the witch-

* 'Patricia Kemball. A Novel. By E Lynn Linton, author of 'Lizzie Lorton of Greyrigg,' 'Grasp Your Nettle,' 'The True History of Joshua Davidson,' etc.' Philadelphia: J. B. Lippincott & Co. 1875.

'Our New Crusade. A Temperance Story. By Edward E. Hale, author of 'In His Name,' etc.' Boston: Roberts Brothers. 1875.

'Progressive Petticoats; or, Dressed to Death. An Autobiography of a Married Man. By Robert B. Roosevelt.' New York: G. W. Carleton & Co. 1874.

'South Meadows. A Tale of Long Ago. By E. T. Disosway.' Philadelphia: Porter & Coates.

'Caleb Kinkle. A Story of American Life. By Charles Carleton Coffin.' Boston: Lee & Shepard; New York: Lee, Shepard & Dillingham. 1875.

craft delusion, systematically considered as an historical episode, cannot yield satisfactory artistic results. Mr. Upham's 'Salem Witchcraft' has exposed the historic and psychological aspects of the subject to the best advantage; and the novelist who bases upon the events there treated will most probably find himself, to his own surprise, slipping quite outside of the circle of artistic suggestion. On the other hand, we do not doubt that motives may occur to him for the development of which the time and place of the witchcraft error would prove to be the best media. But the intention of "illustrating how insidiously the superstition entangled even the most intelligent minds," etc., which the author avows to be his (or her) impulse in the present instance, ensures the failure of the book, if it is to be considered as anything but a dull narrative feebly subtended by a few historical incidents and utterances.

So far as Mr. Coffin is concerned, Salem and the seventeenth century could not have led him to anything more disastrous than 'Caleb Krinkle,' the scene of which is laid in the present—a present, by the way, extravagantly conscious of itself, and very desirous to make itself agreeable to a large class of circulating-library readers. Mr. Coffin's estimate of his public's capacity, notwithstanding this desire, is not flattering. Apparently, he considers popularity something to be secured by the use of a very simple recipe: to so much "chromo" sentiment and machine-made humor, so many catastrophes, a suitable amount of bathos, an inordinate amount of love-making—the more foolish and vulgar, the better. Still, he is disposed to give his readers their money's worth in the way of stirring episode; before we are a fifth part of the way through the book we undergo two deaths, a narrow escape from drowning, a coasting accident, a runaway-horse disaster, and a freshet that displaces a house, a child, and a man, bringing the former two into the story, and carrying the latter out of it. The following is a good specimen of the author's power in the pathetic line:

"Faint and feeble now her breathing. Slower turns the mill-wheel, for the grinding is almost done. . . . The team is all but over the bridge. . . .

"'Randa, darling!'

"'Mother.'

"The wheel is still, the grinding ended, the team across the bridge, and Randa beyond the river."

The concision of statement and unity of action here are notable. To prevent misapprehension, it should be stated that Randa is not on "the team," but on her death-bed; and when Mr. Coffin says that she is "beyond the river" he only means that she has just expired. The title of the book, as if to excuse any possible silliness it may contain, announces that it is "a story of American life." This it emphatically is, in the sense of most novels that of late have laid claim to the protection of the national flag. It is American with "all the fixings," including the Western prairies. These, it is true, are handled somewhat timidly, as if Mr. Coffin's conscience had begun to reproach him at this point; but presently he applies the match and produces a prairie-fire, which little device, assisted by more death, various love-complications, villany, flight, shipwreck, and an emigrant wagon, brings the whole story happily to a close. The reading of such a book induces a despondency from which the only escape lies in reflecting upon the dreadful pangs of remorse which the author himself must suffer on seeing his production in print.

## COLONEL MULBERRY SELLERS.

THE success of Mr. Raymond, an actor hitherto only known in minor parts, in the character of "Colonel Mulberry Sellers," deserves more than a passing notice. The "Gilded Age" is not by any means the first attempt to put American life on the stage. Were it not that a clever actor has succeeded in creating a part in it, we should almost be inclined to say it was the worst of them all—though it would be going far to say so when we recollect such of the others as "Divorce," "Saratoga," and "Women of the Day." But a play, like a tree, must be judged by its fruits, and so Mark Twain and Mr. Warner are fairly entitled to a share of the credit in this case, just as the original author and modern adapter of "Rip Van Winkle" cannot be altogether excluded from the praise of Mr. Joseph Jefferson. There are indeed in the plays of "Rip Van Winkle" and the "Gilded Age" some features, not exactly in common, which make the success of the principal actors in them quite as natural as the failure of their much more ambitious rival, the American "society play." The theory on which the latter is constructed is that there is in America a body known as "society," consisting of a small and select number of people, segregated from the crowd by peculiar customs and different if not more polished manners, who live a life apart and above the rest, who live in society, love in society, marry in society, and die in society. The kind of atmosphere which the "society" play in theory demands is that which may be found attempted in another line of art by such novels as 'Never Again.' The existence of any such society in America has always been with us a matter of grave doubt. American society consists, speaking roughly, of those who can afford it. It is not more difficult to "get into" it than it is to get rich; and it requires no very great amount of training to know how to get along in it when you have once been admitted. Manner, strictly speaking (which, every one knows, if not the life and soul of the stage, is at any rate essential to its existence), is carefully avoided, and instead of a minute code of by-laws enforced by the societies of the past, as we know them on the stage and in literature, as for instance in the "School for Scandal," in the "Rivals," or in Molière, the main object of modern society is to root these out, and to substitute for them a colorless, frank *bonhomie*, which shall express no individuality and hurt no one's feelings. It is, too, not only manner which is frowned upon, but manners as well, though for different reasons. Manner seems to us like affectation; manners are too much trouble. Besides this, there is no social nucleus in America, no central point which remains fixed from generation to generation, to set a standard and "draw the line." Families with us do not last very long as families, because we do our utmost to break them up, disintegrate their cohesion, and dissipate their property by law. There is no court, and no one ever went to Washington to learn the rules of society. In other countries, and in society as we know it from books, there is a body of social law which imposes a number of well-defined duties upon every member, and enforces these duties with the horrid sanction of public opinion; these duties consist of a certain number of definite acts and observances, every one learning what is the proper thing to be done or to be omitted in a given situation. But in a country like America, where society is in a fluctuating state, where its leaders are from generation to generation "selected" by the accumulation of wealth, or else are cases of "survival" from an older set, such precision as this is felt to be out of place, and the result is, as almost any American will be willing to admit who has ever had a foreigner travelling in this country in his care, that the most difficult thing in the world to explain is what is and what is not "permitted." But only by the difference between what is and what is not permitted do we recognize the existence of "society" in the strict sense of the word.

Add to all this that there are certain general causes at work in America which are directly hostile to "society." It has passed, in the first place, very much into the hands of the young, who go out to parties and places of amusement in large herds, being left very much to do as they please, the older people either not going out at all, or merely taking the place with regard to their children that nurses take with children of a smaller growth. The jaded American parent, as a rule, avoids society, and of course a society which is really carried on by crowds of both sexes between eighteen and twenty-five cannot have any very distinctive and marked customs. Beyond the somewhat vague desire to "have a good time," it has no particular aims or laws of any kind.

For these and other similar reasons the "society" play in this country, among those who are really fond of the stage *quâ* stage, has become a byword. It is an attempt at a dramatic representation of a kind of life which is a creature of the mind and has no real existence, and as a proof of this we need go no further than to recall the fact that the "society" play generally includes the settlement of a difficulty about one of the women by means of a duel—a custom which to nine-tenths of the audience is a purely literary one, and has no relation whatever to actual life.

Such plays as the "Gilded Age" belong to an entirely different category from those ambitious dramas which undertake to reveal to curious eyes the secrets of fashionable life at Saratoga and Long Branch, and which actually reveal only unfathomed depths of vulgarity and nonsense. Mark Twain and Mr. Warner have undertaken to give us American life as it really exists. We have here several well-known American characters—the impoverished Eastern emigrant, with his wife and children, to whom the boundless resources of the West have as yet been only the means of sinking him deeper and deeper in that sort of squalid poverty which ends in the creation of "mean whites"; we have him living on from day to day with his wife and children, in hope of a "rise"; we have the young woman of the period, who longs yearningly in the first act that she may do something to "help," and in the fourth shoots her lover at sight; we have the trial-scene, in which she is of course acquitted; and we have Colonel Sellers himself, the sanguine projector of a thousand schemes for making his own and all his friends' fortunes, the confidant of that wonderful man Senator Dilworthy, the typical speculator and American, who cares little or

# The Nation.

*NEW YORK, THURSDAY, MARCH 4, 1875.*

## The Week.

CONGRESS has at last passed the Civil-Rights Bill, and the President has signed it. The bill, as passed, does not enforce mixed schools, and only secures negroes equal rights in public conveyances, inns, theatres, and other places of amusement. While the bill was on its passage in the Senate, Mr. Tipton of Nebraska moved to insert the word "churches" after the word "theatres," including the former under the head of places of amusement—a suggestion which of course brought down the galleries, though it really is not much more amusing than the bill itself. The negroes of the South, being mainly occupied in tilling the soil, or in labor of some kind, are not as a rule in the habit of travelling much from place to place; and when they do go from time to time to some local court-house or county-seat for a holiday, they are apt to move in crowds on foot, or in wagons not subject to the jurisdiction of Congress. They do not frequent hotels much, for similar reasons, and the number of theatres and opera-houses in the South is not so great as to warrant the expectation of a great advance of the race through the influence of the drama and music. Indeed, it is a harmless bill, and does not seem to have had much effect on public opinion in the South. The chief objection to it is its entire unconstitutionality, which Mr. Carpenter showed, much to the consternation of the Radical Republicans, in an able and convincing speech. Besides this, the Senate has passed the bills admitting Colorado and New Mexico as States, the bill for changing the mode of counting the votes on the Presidential ticket, the Tax and Tariff Bill, and the bill for the equalization of bounties.

---

The House has passed the Sundry Civil Appropriation Bill, and Judge Poland's Arkansas resolution. The Force Bill went through substantially as it came from the caucus, the only changes made being the insertion of provisions restricting the President's right to suspend the habeas corpus to the States of Louisiana, Arkansas, Mississippi, and Alabama, and limiting the operation of the habeas corpus section to "the term of two years, and from thence until the end of the next session of Congress thereafter, and no longer." The Democrats resorted to filibustering to prevent the introduction of the Force Bill, and the House had a night session in consequence, notwithstanding the new rule passed to prevent it. During the proceedings the Republicans were led by General Butler, and the Democrats by Mr. Randall, and the chair, during most of the time, was occupied by Mr. Blaine, who showed great fairness and strength in managing the House. The Louisiana resolutions introduced by Mr. Hoar's committee, one recognizing Kellogg and the other recommending the Kellogg legislature to remedy the injustice done the Conservatives, by reseating the five members expelled, have also been passed. The Louisiana Conservative caucus has accepted what is called the "Wheeler Compromise," the details of which we gave a week or two ago; and the sum and substance of which is that the Democrats shall have the House of Representatives, but that Kellogg shall not be turned out of office, but treated as the legal Governor till the end of his term. Although the means taken to arrive at this result have been somewhat extraordinary, we have no doubt whatever that it is the best arrangement that can now be made. It would put the Conservatives in a position of security, and at the same time the recognition of Kellogg is just the kind of sop to satisfy the Administration Cerberus, and can hardly make the situation at New Orleans any worse than it is now, as Kellogg is certain to be kept in office by the troops for a good while in any case.

---

The newspapers and "constitutional lawyers" who undertook two weeks ago to show that the expulsion of the five members by General De Trobriand and the soldiers was lawful and justifiable, must not now begin applauding the settlement, and pretending it is what they always recommended. It appears from the vote of the House that these five members were lawfully returned; that they had the right to sit and vote in the legislature; that in leaving their names off the roll the Returning Board acted fraudulently. It appears, too, from the recommendation to the legislature to seat them, that the legislature is the judge of the matter, and nobody else, and that the majority present on the 4th of January was alone competent to pass on their qualifications. As a matter of fact, however, their qualifications were passed on by a military officer and fifteen soldiers, called in from the street by an insubordinate minority. There never was even a semblance of right about the matter, and yet we had for some weeks to listen to a great quantity of smart *nisi-prius* sophistry; Mr. Conkling, as might have been expected, contributing fourteen columns of it, showing that the presence of the five members made the legislature a riotous mob, and authorized armed interference with its proceedings. The persons and journals who treated us to this will, however, now go about looking as wise as ever, wagging their heads and giving advice, in full reliance on the popular forgetfulness. But ought folly of this sort, which it is no exaggeration under the circumstances to call criminal, to be forgotten in a month or two?

---

One of the most remarkable circumstances attending the passage of the Force Bill is the fact that two-thirds of the majority which passed it is composed of members who are to go out of political life on the 4th of March. Another is that they have deliberately empowered the President to suspend the habeas corpus in one State, Arkansas, which the House has actually decided, after enquiry, to be peaceable and orderly. Moreover, when recently some so-called Union soldiers signed a paper confirming the hap-hazard account given by General Sheridan of the disorderly condition of the State and the prevalence of "murders," Governor Garland promptly directed the district-attorney to hunt up the signers, and bring them before the grand jury, to testify on oath about the "outrages" of which they professed to have knowledge. This was done, but before the grand jury they had no knowledge of anything whatever. They had *heard tell* of "murders and outrages," and presumed they must have occurred; but this was all. What makes the conduct of the majority all the worse is that Brooks and his set, for whose restoration by force of arms the Shepherd clique and the President are laboring, are the same gang who performed the feats of plunder on the State treasury which we described three weeks ago, and who are now anxious to go back to their work. The comic feature in the matter is Butler's professions of philanthropy and of reliance on an overruling Providence—not that there is anything amusing in his cant and hypocrisy, but in his belief that it affects the public mind.

---

The Mississippi majority report declares that shortly after the election of Crosby as sheriff of Warren County a taxpayers' league was formed for the purpose of correcting abuses in the administration of public trusts; that subsequently, however, another organization made its appearance, which was undoubtedly a branch of the White Leaguers, its object being to prevent negroes from holding office in any case; that this White League captured the taxpayers' organization, and then began their work by patrolling the streets of Vicksburg, going to registration in armed bodies, etc., etc.; that society is in a disorganized state, and that Governor Ames was amply justified in applying for troops, and the President in furnishing them. The minority report, on the other hand, states that the white citizens in Vicksburg pay 99 per cent. of the taxes; that the negroes assess, collect, and disburse them; that the debt of the city, which in 1869 was $13,000, is now $1,400,000, the population being 11,000;

that a "corrupt and infamous ring," in collusion with Peter Crosby' the sheriff and tax-collector, got hold of the city, and rendered the administration of justice impossible; that Cardozo, the leader of the ring, being indicted, the judge of one of the courts—as we understand it, the court which was to try him—publicly pronounced it a case of "persecution"; that the taxpayers' league had no partisan objects; that Crosby's bonds were utterly insufficient; that the supervisors corruptly declined to compel him to give good bonds; that the taxpayers had therefore no remedy but to request Crosby's resignation; that his resignation was voluntary; that the fight on December 7th was solely caused by the negroes, incited by Crosby, attempting to invade the city; that the whites only defended themselves against an attack; that there is no White League in Mississippi; that the call of the Governor for troops was based on untrue statements; and that, Crosby having resigned, and Flanagan being elected and in peaceable possession of the office, he was marched out at the point of the bayonet by United States troops.

---

The Alabama Committee is also divided in opinion, and is, indeed, an excellent example of the *reductio ad absurdum* in politics. The majority say that the condition of the State is terrible; that the blacks are slaughtered whenever they show themselves in the neighborhood of the polls; that the whites who vote the Republican ticket are lucky if they escape with "ostracism"; that, when an election occurs, the State is invaded by piratical repeaters from Georgia, armed to the teeth, no doubt, who make law a mockery, justice a farce, and the voice of the people an empty echo of the rebel yell. On the other hand, the minority report that the State is in a condition of profound peace; that the negroes are happy and contented; that there are no more outrages done and no more need of troops than in Missouri or California. The report also discusses at length the stories of Mr. Charles Hays, which made so much noise last fall; these, the majority say, are substantially corroborated by the evidence, and the minority say are a bundle of lies. The minority complain of the majority for not letting the committee go into the "bacon-intimidation" branch of the subject; and, finally, the majority declare that nothing will pacify Alabama short of the Force Bill, and the bill was actually passed under the supervision of this remarkable committee.

---

Colorado and New Mexico will, it is hoped by Republicans, send four strict party men to the Senate, and thus make the party a little more sure than it can be said to be at present of having a working majority in that body to act with the President. In passing the bill admitting these States, the Senate amended it so as to require constitutions which shall contain no distinctions in political or civil rights founded on race or color; and the fate of the bill is still undecided. The senatorial elections are all over, with the exception of one vacancy from Louisiana, and they have decidedly changed the political complexion of that body. The Boston *Journal*, which is not usually lukewarm when there are figures to be counted, classifies the Senate as Republicans, forty-three; Democrats, twenty-eight; Liberals, two—thus giving the Republicans a majority of thirteen. But the *Journal* admits that in this majority are to be found four or five Republicans like Ferry of Connecticut, Cameron of Wisconsin, and Christiancy of Michigan, who have been elected by the aid of Democratic votes. Still, it thinks there is little reason to doubt there being a party majority. The difficulty, however, with this sort of a working majority now is, that no one, even of its own members, knows exactly what it is going to work for or what it is going to work against, nor in many cases would it be able to know whether it was for or against a measure until it was first decided by a majority vote whether the measure was, strictly speaking, Democratic or Republican. The fact is that, for the average politician, his business is at present a good deal "mixed"; and those statesmen who have not guided their steps by the light of duty and the moral law are now in a dreadful quandary as to whether they shall move backwards or forwards, or in what direction.

The Pacific-Mail Committee's report, said to have been drawn up by Mr. Kasson of Iowa, is quite mild in its language, and hardly recommends anything, except that Bill King be prosecuted for perjury as soon as he can be caught. Schumaker, they think, ought to be made to remember what he did with the $300,000 or so entrusted to his care, and the committee seem to be of the opinion, in which the public appears to agree, that they have not found out much after all. The most sensible thing they do is to recommend the passage of a bill to regulate lobbying at Washington, to put a stop to the possibility of unauthorized adventurers swarming about the Capitol, or at any rate thronging the committee-rooms, and not in reality representing any one, but talking for or against measures with money in them on the chance of getting some of it by means of promises and threats. Lobbying, in the sense of preparing facts and arguments, in the interest of private persons, with regard to pending measures, is a regular and unavoidable branch of the public business, and must continue to be so as long as legislatures have the right to pass private bills; and the way to improve the tone of it is by subjecting it to restrictions and regulations, by making it a business in which decent men can engage without dishonor or discredit. Irwin, the agent and distributer of the Pacific-Mail money, is now "recuperating" from the effects of his hard winter, and has written to a friend that he needs "a few days' absolute rest," now that "that wretched investigation has ended its persecution." He announces that he is going into the country, "where there are neither newspapers nor telegrams, nor Congress nor directors; where the wicked cease from troubling, and the weary are at rest," and adds, "I suppose Rufus and his gang will howl. Let them for a week. I am tired of having 38,500,000 people sitting on my head, and I must have a few days' rest."

---

Senator Jones has asked the opinion of Mr. David A. Wells as to the Reciprocity Treaty with the Hawaiian Islands. Mr. Wells carefully investigated the subject when he was Special Commissioner of the Revenue, and in his opinion the treaty ought not to pass, being in effect a measure to take a million or so annually out of the Treasury, now paid as duties on sugar, and hand it over to the American sugar-planters on the islands. The principal import from the islands to this country is sugar, and the treaty proposes to admit this free, and in return to admit to the islands all kinds of manufactured articles from the United States.

---

The *Financial Chronicle* sums up the defects of the Tax Bill, by showing that it does not fulfil its original purpose, as it does not designate the specific use to which the money raised by it is to be appropriated; that it has been creating general alarm and uneasiness, by causing uncertainty as to what articles it would finally reach, the debates and votes on it in the House bearing a striking resemblance to the discussions of the opéra-bouffe; and that, by taxing an enormous number of articles for the mere purpose of raising $35,000,000, it increases the complication of the tariff, and thus harasses the honest trader more than it helps the Treasury. When we consider, too, that this important duty of providing for the wants of the Treasury was left until the last days of the session, its consideration being postponed for such futile measures as the Civil-Rights Bill; that, when it did come up, it was debated and amended as if it were a huge joke, and that the chairman of the Committee of Ways and Means finally got it passed in its present shape by a sort of trick, more people than ever will ask whether some means cannot be devised for saving the business of this great commercial country from the kind of men whom some constituencies persist in sending to Congress.

---

Since we spoke last week of the desirableness of calling Mr. Henry C. Bowen as a witness in the Tilton-Beecher case, that gentleman has published a card in reply to the denunciation of him by Beecher's counsel, in his opening speech, as a participant in an alleged conspiracy got up against Beecher by Tilton and Moul-

ton. In this card, he declares his readiness to testify, and reveals considerable hostility to the Beecher side, and, abandoning all disguise, boldly announces his disbelief in the doctrine "that lying is justifiable under certain circumstances." We are informed since last week that though both sides have subpœnaed him, the reason why neither has called him is, that, with his accustomed shrewdness, he refuses to make known what he will say if placed on the stand. This reticence naturally makes him "a shape of dread" both to plaintiff and defendant. Now, however, that Beecher's counsel have openly declared war against him, it is reasonable to suppose that he will appear among Tilton's rebutting witnesses, and though we cannot honestly say that we consider him successful as a religious teacher, and much doubt whether he "saves" any perceptible number of "wicked men" in the conduct of his business, we feel sure that as a rebutter he will make his mark.

---

The process of unification which Bismarck is carrying on in Germany is likely to receive powerful aid from the new Imperial German Bank, which the German Parliament has just established, and which is to go into operation on the first of next January. It bears in its objects a remarkable resemblance to Mr. Chase's National Banking scheme, but goes much further, as might be expected, in the direction of Governmental control, for it is really rather a political than a commercial machine. A few of the existing state banks—thirty-two, we believe, in all—are still left the privilege of issuing notes within their own districts, but in a few years even these will have disappeared, and the Imperial Bank alone will then supply the paper currency of the Empire. The capital of the Bank is to be $30,000,000, and its operations, besides of course receiving deposits, are to be dealing in bullion, discounting three-months bills, with two good names, lending money on state or municipa stocks, with a margin of twenty-five per cent. of their current value, and, in the case of foreign-government securities, of fifty per cent.; and the bank is to have the power of summary sale of the securities, without notice, in case of non-payment on the day named. All the Government does for the bank is to guarantee $70,000,000 of the paper issue, and exempt it from taxation; but it reserves the control of the whole establishment, and is to exercise it through a board of four commissioners, and these are to be absolutely subject to the order of the Chancellor of the Empire. The shareholders are to be allowed to give their advice at meetings, and through a permanent committee, but it is open to the directors not to take it—a privilege of which these gentlemen will, doubtless, freely avail themselves. The check on overissues of notes consists in a heavy tax, to be levied on borrowers in the form of discount. In this and all the rest of the great mass of centralizing legislation in which the Imperial Government has been forced to engage, the specialists who so abound in Germany have been freely used in drafting bills and preparing reports. Nothing has been left to "the rule of thumb." When a law is wanted, all the leading students or practitioners in that particular field are called on to aid in preparing it, and it is turned over in every conceivable way by statisticians, lawyers, and professors before being presented. Barbarians and blatherskites are not allowed to take hold of the legislation of a civilized people, and "go it blind" to "help the party," or "ease the market," or "move the crops."

---

The city of Paris has been inviting subscriptions to a four and a-half per cent. loan of $44,000,000; and, as it was offered on the popular plan, which came into so much favor under the Empire—that is, of receiving subscriptions directly from all persons willing to take one or more bonds, instead of making a contract with a syndicate of bankers and leaving them to retail it at a profit—the subscriptions amounted to forty-two and a-half times the amount required, so that the money deposited on account vastly exceeded the loan. But the result is disappointing to the city in some ways. It shows, in the first place, that the municipal credit is so good that the bonds might have been offered at a much higher figure, and it makes quite certain what has been long suspected, that "popular loans" do not always reach the people. They are now subscribed for on so great a scale that, in order to get what you want, if you want more than one bond, you have to ask for as much more as you think the bids will go beyond the amount of the loan. In the present case, for instance, people calculated that the loan would be covered twenty times, so that a man wishing to get five bonds sent in his application for one hundred, and, as each application has to be backed by a deposit, the amount of money one had to let lie, without interest, pending the assortment of the bids, was very great. This state of facts has become so well known that small capitalists no longer bid, and the business of "popularizing" has fallen into the hands of middlemen, who bid lavishly and afterwards sell at a premium, so that the state does not get the benefit which formerly accrued under the old system from competition between bankers, and the people do not get the bonds free of the banker's commission. It has now come to light that the popular plan was tried in 1818 under the Restoration, when the loan offered was covered eleven times over; but it was then discovered that much of the bidding was, as now, speculative, and the plan was abandoned until Louis Napoleon revived it in 1854 as a feature of the Imperial system. We have probably seen the last of it.

---

Twenty-three of the German Catholic bishops have signed a joint declaration in reply to the circular despatches of Prince Bismarck of May, 1872, of which we recently gave a summary, relating to the necessity for the interference of the great Powers in the election of the next Pope, owing to the reduction of the bishops to the position of mere tools and "employés" by the Vatican Decrees. The German bishops now stoutly deny the assumptions of the circular. They say that the Pope is still, as always, Bishop of Rome, and not bishop of every other city and diocese, but is "chief of all bishops," as he has always been, and as such is obliged to see to the proper administration of every diocese. But there is nothing in the enactments of the Vatican Council to justify the assertion that he has become an absolute sovereign; he cannot "change the ordained constitution of the church," etc., etc. The Catholic dioceses are governed now as they were before the Council met, and the bishops deplore the adoption by the German Government of the construction put upon the Decrees by the Old-Catholic and Protestant theologians, and end by protesting solemnly against any attempt to interfere with the Papal election.

---

The finances of the Austro-Hungarian Empire are in a bad way, or, rather, those of Hungary are. When the new political organization was set up in 1867, it was agreed that Hungary should contribute thirty and Austria seventy per cent. of the revenue needed for common uses. Since then, Austria has made such exertions as she had never made before in her history to make ends meet. She began by a piece of repudiation in 1867, which we noticed at the time; but she also began a steady process of reduction in her usual annual deficits. In 1868, she had a deficit of $16,860,000, but she gradually overcame this, and in 1872 had a surplus for the first time in a century. In 1873, she had a panic from overtrading, but is recovering from it, and is steadily keeping her head above water. The Hungarians, on the other hand, having less financial experience, and being full of eagerness to share in the material prosperity of the Western world, and a little intoxicated with the joy of their political liberation, launched into heavy expenses. They set up an imposing administrative machine, bought up the feudal rights of the nobility for the benefit of the peasantry, and began an expensive scheme of "internal improvements," particularly railroads; and the result is that there is now an annual and increasing deficit, which there does not seem to be enough financial ability in the Reichstag to cope with. The expedient most talked of is a sale of the public domains, which are supposed to be worth $300,000,000, but it would take twenty-five years to dispose of them satisfactorily.

## POWER WITHOUT RESPONSIBILITY.

THE *Evening Post* has advocated in a large number of articles, of which we cannot do more than recall the general drift, the expediency of convening the new Congress on the 5th of March, immediately after the dissolution of the old one, so that the Democrats might be forthwith charged with the responsibilities of legislation and, as the phrase is, "be forced to show their hand." We questioned the value of this suggestion early in December, on the ground that the delay between the end of the present Congress and the meeting of the next "would prove a salutary obstacle to much needless and partisan activity," and we do not think anything has since occurred to lessen the force of our objection. On the contrary, we think the events of the last three months have strengthened it. The defect in the law which this winter's experience has revealed or made prominent is not the fact that the new Congress cannot meet until December, but the fact that the old Congress continues to sit and legislate after the majority in it has suffered defeat at the polls, or, in other words, has received notice that it has lost the confidence of the country. If the late election had given the Democrats complete possession of the Government, it might, on the English theory, be urged with a great deal of force that the party which had acceded to power should be immediately compelled to assume the responsibility of exercising it; that is, if the elections of last fall had given us a Democratic President and Senate as well as a Democratic House, or had even given us a Democratic House and Senate, there would be a manifest propriety in compelling the party to take upon itself at once the business of legislation and administration. But under our system, whether rightly or wrongly, but as we think rightly, the defeat of the party in power at the polls does not involve the immediate transfer of power to the victor. Therefore, even if Congress met in March, the Democrats could not take possession of the Government. They could neither legislate nor administer in accordance with their own ideas; they could only resolve and investigate. They would not have the sense of responsibility which comes from the actual possession of authority, and would, therefore, not really "show their hands." They would probably say a great many things they did not mean, and threaten a great many things they never intended to carry out; and although their talk might be harmless, it might also be mischievous, as the talk of men who have no responsibility for what they say is very apt to be. It might have a very disturbing effect on the business world. It might affect the public credit unfavorably, and might excite mischievous expectations at the South. In fact, there is at the present juncture only one thing which, as it seems to us, can *certainly* be said in favor of a meeting in March, and that is, that if, as is positively affirmed in many quarters, and as his Arkansas message does in some degree indicate, the President has put himself in the hands of advisers like "Boss" Shepherd, who are in their turn the cronies of the Southern carpet-baggers and jobbers, it would seem desirable that the House should be in session to watch him during the coming six months, or should meet long enough to put some moral restraint, at least, on his use of the army for the purpose of pushing his own fortunes or those of his more desperate followers.

With these reserves, we think it can hardly be denied that the prearranged slowness with which power is transferred from one party to another is a very salutary feature in the American system. It takes from ten to fifteen years now to beat the party in power at the polls under the ordinary process of discussion, and two years after it is beaten to get the reins of government out of its hands. And that which makes it difficult for a party to obtain power is what makes it difficult for it to lose it. The arrangement of the Government machinery is such that the Executive and each House of the legislature have to be captured in succession before the opposition can obtain the reward of its striving, and this can only be accomplished by a thorough conquest of public opinion. A passing gust of popular feeling, roused by this or that incident, is not sufficient. Nothing is sufficient but settled and widespread conviction, and settled and widespread conviction can only be produced by some stirring principle or far-reaching policy. The result is that when a party gets into power, as long as it seems really faithful to the principle or really engaged in carrying out the policy, its mistakes or shortcomings on minor points do not seriously injure it with the public, or only injure it slowly. The process of alienation goes on almost tediously, and is often almost imperceptible until it is complete; but, when this point is reached, the burst of opposition is apt to be very vehement and irresistible, particularly as it is apt to be precipitated by unbearable excesses on the part of the men in authority. Anybody who will study the history of the closing years of the last Democratic Administration, and compare them with what is now going on in Washington in the Republican party, will find abundant proof and illustration of all this. Now, we hold it to be a wise and prudent thing that the majority, when it is in this paroxysm of indignation and disgust, should not be able all of a sudden to have its way—that it should have to wait and reflect, and see whether things are really as bad as they seem, and whether the first wild remedies suggested by the iniquities of hardened and audacious partisans are real or only apparent remedies. Much as we condemn the performances of the Republican party at the South, shocking as many of them have recently been, we are glad that the new Congress is to be obliged to think over them for a year before dealing with them. Questions over which eight or ten millions of voters are excited are and must always be weighty questions—questions which will both tax the understanding and kindle the imagination; and it is of the greatest importance that they should in the last resort be approached cautiously, and treated in cold blood. Where should we be, for instance, if every time a two-year craze like the Granger movement sprang up it was possible to sweep the whole Government into support of it, before discussion and experiment had time to test and analyze it, and find out whether it sprang from a passing fantasy or from a real grievance?

But there is one feature in the present state of the law for which there is really no excuse, and which, in view of what is going on at Washington, it is no exaggeration to call scandalous—we mean the persistence of the majority in legislating actively on subjects with regard to which it has received formal notice that it no longer possesses the confidence of the public. There is nothing to be said in defence of this on any theory of responsibility, and a more glaring illustration of its evils could hardly be offered than is now to be witnessed in Washington. Here we see a body of men wielding all the power of the Government months after they have been dismissed from office, and therefore under no proper sense of responsibility to anybody. Take the case of Butler, for instance, who has been during the last week acting as "leader" in an attempt to carry a measure making unprecedented and reckless changes in the administration of the Government. He has been turned out of his seat; he hardly expects to get back into political life, and is, therefore, under no restraint whatever from any quarter, and really at this moment has no constituency; but this fact, instead of moderating his legislative activity, increases it; and his case is that of a large proportion of his colleagues. Of the 134 members who voted for the Force Bill, 96 have lost their seats, and are now irresponsible political adventurers. The majority of those who have not been returned are really acting as if the opinion of the voters had nothing to do with giving them their power, and ought not to influence their manner of exercising it, and as if the formal withdrawal of popular confidence operated as a general license to commit any excesses they pleased. It would be difficult to conceive of a more demoralizing spectacle, or one better calculated to make incoming legislators reckless and unscrupulous, and to increase the insensibility to public opinion, already so strong at Washington, which is so hurtful to rational legislation, and which is apt to result to a greater or less extent from the admission of a long interval of time between the casting of the vote and its effect on the Government. We would even admit that the political apathy on the part of the mass of the people, of which so much complaint is made, is largely due to the same cause. A man who does not see his bullet strike for two years is apt to lose his interest in the shooting; but then the

choice of all political methods is, in the present state of human nature, apt to turn on a comparison of disadvantages; not one is perfect. The reform in the relations between the people and Congress which is now most plainly called for would seem to be, not the sudden admission of the new majority to power, but the exclusion of the old one from the unwarrantable exercise of it. Such a body as the House has been during the present session is an anomaly which no free state ought to permit, for it has nothing either to fear or hope from the people which elected it.

## RHETORICAL TRAINING.

THE extraordinary, and we believe unprecedented, spectacle to which the public has been treated within the last few days, of an advocate in an important cause opening his case to the jury by reading a manuscript to them through the working hours of a whole week, has called forth more or less remark from the press, but not nearly as much as it merits; for it is not an isolated fact. It is, as everybody who is in the habit of paying much attention to our public speaking cannot but feel, one of the signs of a tendency of considerable moment, to which we must beg the attention of those who are just now concerning themselves with the training of young men in the art of persuasion.

There has been within a few years a good deal of discussion at Harvard College—and, for aught we know, at other colleges—over the necessity of bestowing more attention on instruction in rhetoric, or, in other words, in the art of expressing one's self fluently and correctly in public; and some people—among others, the gentlemen who have of late busied themselves in getting up what are called "intercollegiate contests in oratory"—have been fearing that the neglect of this branch of education in our great institutions of learning was going to work serious evils, by lessening the influence of educated men in public life. Now, we venture to assert that the faculty of fluent speech in public was never in so flourishing a condition as it is at this moment in the United States; that the number of persons capable of making a respectable off-hand speech, on the stump or after dinner, was never so great, in proportion to population, as it is now; and that this faculty grows steadily, and is, indeed, so widely prevalent, and seems to come so naturally, that it is not unreasonable to set it down now as an inherited trait of the race. The English shyness and awkwardness and hesitation which, it is fair to suppose, the original settlers brought with them to this country, have certainly disappeared among their descendants. The American of our day is in short a natural orator; he carries himself becomingly and gracefully, and can almost always find something to say if suddenly called on, and can say it in clear and appropriate language. Moreover, the circumstances of the country are such that a stimulus of the most powerful kind to the acquisition of rhetorical fluency is applied to every one as soon as he is twenty. The nature of the Government, the extensive use of co-operation in all sorts of enterprises, the widespread passion for "listening to a few remarks," created by the diffusion of education, and the difficulty of any mode of securing personal influence or popularity except through the tongue—all force men of energy and ambition into the practice of oratory. Nowhere, in short, is preliminary training in this field during one's boyhood so unnecessary, or, as many think—and we ourselves among the number—so likely to prove hurtful.

There are, on the other hand, facts which it seems at first blush difficult to reconcile with the foregoing. First of all, there is the fact that in the legislative bodies of no country in the world does oratory produce so little effect as in this one. It is hardly ever known to change a vote, and the occasions are rare, are becoming rarer, when it is listened to by either friends or foes. Nearly all our legislators, indeed, when they speak, address themselves to their constituents rather than to their fellow-members. This anomaly is, however, largely due to the action of the press and to the working of party machinery, and perhaps only in a small degree to the quality of the oratory. But, secondly—and it is to this we wish more particularly to direct attention—there can hardly be a doubt that, *pari passu* with the increase of readiness in speaking on ordinary occasions, there has grown up a want of readiness in speaking on extraordinary occasions, and an inclination, as in the Brooklyn case, to substitute a written essay or "statement" for a genuine speech. One is apt to infer from a man's skill in after-dinner or other festive oratory, or from his fluency on the stump, that he can also rise to the height of a great argument, and can, at a crisis calling for the exertion of all his oratorical powers, bring them into play. But, we think, most people's experience will corroborate our assertion when we say that the disinclination or inability to make speeches on serious or weighty subjects not chosen by themselves, or indeed to attempt any momentous piece of persuasion, increases among the most practised post-prandial and stump speakers. Every one, of course, knows what the "great speech" of the average Congressman has become. It is usually a diffuse written essay, full of quotations, often far-fetched and sometimes absurd, which he expects few people to listen to, and only lets off that he may get it printed. But the speaker out of doors is fast following his example, and refusing to encounter the risks and labors of real oratory. If you let him select his own theme, and ask him only to be light or gay and entertaining, he will often do wonders to please you. But if you ask him to face an audience on some really important emergency, when he is to bear the burden of a great cause whose fortunes his words are really expected to make or to mar, in ninety cases out of one hundred he will not trust himself either to think on his legs or to recall on his legs the results of past thinking. He will not even rely on notes, but will extract from his coat-tails with much solemnity a treatise of greater or less dimensions, and read it to you in his best manner. The newspapers are partly to blame for this state of things by their courtesy in giving the name of "speeches" to what are really essays—another illustration of the evil results of inaccurate language.

The practice has been growing steadily for a good many years. To say who invented it, or, rather, gave it dignity, might lead to acrimonious discussion; but when it has invaded the bar—which is the oratorical profession *par excellence*—and when a jury are bored and the time of the court wasted and the advocate's privileges abused by the reading of an essay which might have been printed and distributed as a pamphlet, it is time to say that the practice ought to stop, that judges ought not to permit it, that the public ought to discountenance it, and that the educators of young men ought to consider seriously what leads to it.

What leads to it seems to us tolerably plain. It is not want of fluency, or aplomb, or skill in the use of language; for these, as we have seen, are very common, and are encouraged by all conditions of our social and political life. It is, as we believe, the want of that good mental training which enables a man both to think clearly and to classify and store away his knowledge in such a way that he can produce it promptly when he wants it. No dexterity in the use of words will make a man an orator without this, or make oratory an art much more respectable than comic singing. It is the want of it, and nothing else, which drives all these ready speakers to their manuscript. The minute they are called on for a display of their highest powers, on a subject which circumstances have forced on them, and with which the gravity of the occasion will not allow them to trifle, the easy assurance of the dessert-table and platform then vanishes completely, and the persuader becomes all of a sudden as little of an orator as anybody, and as helpless as if he had never faced an audience before.

The remedy lies not in setting young men to spout in public, before they have learnt to think—and when their ideas are, in the main, merely detached memories of books—on subjects to which they themselves take some light fancy, but in training them in the art of reasoning, in the arrangement of materials, in the quick perception of relations, and in penetrating to the heart of knotty questions and extracting essential facts. This is the proper work of education; the fluency, if it be not constitutionally wanting, is sure to come afterwards in this country; and the gentlemen who are so laboriously getting up the "intercollegiate contests," and some

of those who are occupying themselves about the rhetoric in colleges, are, as it seems to us, vexing their brains over the question whether a duck will swim when it gets to water. What we all need is not more glibness or assurance, for of these most of us have as much as is good for us, but well-ordered brains, which will stand us in good stead on great occasions as well as on small, and make us weighty as well as brilliant. Of the results of purely rhetorical training there is a melancholy example now to be witnessed in the case in which Mr. Tracy has just been reading his pamphlet. Upon certain natures its effects seem almost as baneful as those of excessive alcohol; as destructive of manliness, of simplicity, and of power, as productive of fatuous conceit and self-worship. It is almost certain to produce, too, love of notoriety; and when once this takes possession of a rhetorician, it consumes him utterly.

## SIR CHARLES LYELL.

THE telegraph announces the death of Sir Charles Lyell on Monday, February 22. His name is not less inseparably connected with the progress and, we might almost say, the completion of a great revolution in geological science (though less conspicuously connected with it) than the greater names in astronomy are with similar periods of transition in that science. The establishment of geology as a strictly inductive or positive science was in a great measure due to the early, clear, and steady conception of true method in its pursuit, which Sir Charles Lyell's works have done more to expound and promulgate than all other geological publications in this century. It would be difficult to estimate how much of the patient, soberly-directed labor of the modern army of geological explorers has been inspired by his researches and the influence of his teachings; but it is clear that the position early won by him through his writings and observations was a most important one for the guidance of a movement in which, from its magnitude and need of many leaders, no master-mind could by wisdom or energy have attained to such relative rank as has been won by genius in lesser movements of scientific progress. Lyell was born in 1797, at a time when the principles of sound method in geology were just beginning to be adequately appreciated. In that year Playfair published his illustrations of Hutton's geological theories, which as completed and amended may be said to have determined the chief line of progress in this century. Ten years later, in 1807, the Geological Society of London was founded. Of this body Lyell was made president at an early age in 1836–7, and again in 1850–1. He had published the first edition of his 'Principles of Geology' in 1832. The eleven editions of this work, of which the last appeared in 1872, and the seven editions of his 'Elements of Geology,' the last in 1871, may be regarded as chronicles of a progress of which he was the principal historian and a chief actor. Narratives of two visits to the United States, one for geological observation and the second for social as well as geological studies, were published in 1841 and 1845.

The publication in 1863 of his work on the 'Antiquity of Man' marks an interesting *dénoûment* of the great movement with which his lifetime was almost coincident, and with which his name and work are inseparably joined. At the end of the last century, the transmutation or development theory was independently and almost simultaneously proposed by three great thinkers, Goethe, Geoffroy St. Hilaire, and Erasmus Darwin. Its final triumph in our day was almost a direct consequence of the principles adopted by Lyell from Hutton and the Huttonians, and urged so clearly and effectively by him in his 'Principles.' Yet Lyell—and this was an interesting exhibition of a worthy trait of his mind—resisted the theory of development for a long time; until after the publication of that most remarkable book of the century, Darwin's 'Origin of Species.' He showed in the early editions of his 'Principles' a decided, though just and appreciative, opposition to Lamarck's theories; and it thus happened that Lyell was one of the few veterans in science who were converted from their older views by Mr. Darwin's arguments. Though nearly seventy years of age, he showed the genuineness of his conversion by rewriting in the tenth edition of his 'Principles' the chapter on the development theory, and other matters relating to it. This change gives his masterpiece a greater logical completeness and coherency than it had ever had before, and redounded to his credit in this way quite as much as in the exhibition it gave of his openness of mind to scientific arguments, or of the moderation of the conservatism which characterized him as a true English Liberal.

Hutton, the knowledge and practice of whose principles Lyell did so much to extend, was the first to declare that geology was in no wise concerned "with questions as to the origin of things." By "origin" was then meant the origin of the natures which things have and their first introduction in the theatre of the world. That cosmology should have been so far banished in half a century from zoölogical conceptions that Mr. Darwin could use, without incurring serious misunderstanding, the title 'Origin of Species' for his great work, is evidence of the progress made. "Origin" has now come to mean the coming to pass of anything in the course of events, and is concerned only with how things go on from one determinate appearance to another. "In the economy of the world," said Hutton, "I can find no traces of a beginning, no prospect of an end"; "a declaration," Lyell remarks, "the more startling when coupled with the doctrine that all past changes in the globe had been brought about by the slow agency of existing causes." But Lyell was not free at the outset, nor for a long time, from another misleading scholastic conception which scientific progress has also nearly banished, namely, the scholastic meaning of the word "species." From his deference to the authority of leading minds in systematic natural history he attributed to the authority of their observations what was only involved in a received meaning of a word, namely, that a species was only properly so called because it exhibited invariable characters, and yet that the word was applicable to actual existences. These naturalists, with this meaning in their minds, applied the name to existing and past organic races, implicitly asserting thereby more than their authority as observers could warrant. The word now means not an absolute, but only a comparative fixity of character, so that in Darwin's treatise both words of the title, 'Origin of Species,' appear with modern unscholastic meanings. But this was in great measure due to the influence of the doctrines and methods which Lyell has done so much to promulgate. In perfect sympathy with the scientific aspirations of earlier Italian geologists to explain the phenomena of the earth's formations "without violence, without fictions, without hypotheses, without miracles," he early perceived the value of scientific societies devoted to the patient collection of data for science, and principled against the premature speculation of theories. The Geological Society of London was such an institution, in which no "theories of the earth," as they were called, were tolerated. Such institutions, like the monastic refuges for culture of old, were securities to scientific observation against the vanity and ferocity of scholastic disputation.

Among the many graphic and instructive illustrations of geological changes from slowly-working natural causes, Lyell gives an account of a great flood at Tivoli, in 1826, in which the "headlong stream," as Horace had called it, the Anio, produced the most destructive effects; the flood coming "within two hundred yards of the precipice on which the beautiful temple of Vesta stands. But fortunately, this precious relic of antiquity was spared, while the wreck of modern structures was hurled down the abyss." Vesta, the goddess of the hearth, was the mythological representative of the stability of the earth; and when Aristarchus, the Samian astronomer, first taught the Pythagorean doctrine of the earth's motion on its axis and around the sun, he was publicly accused of impiety, for "moving the everlasting Vesta from her place." Lyell is reminded by this coincidence of Playfair's remark, that when "Hutton ascribed instability to the earth's surface, and represented the continents which we inhabit as the theatre of incessant change and movement, his antagonists, who regarded them as unalterable, assailed him in a similar manner with accusations founded on religious prejudices." There appears to be a strong natural association of religious feeling with the idea of stability; and three wrongly consecrated stabilities—that of the earth, that of its continents, and that of its forms of life—have one after another given way to the progress of knowledge, and, though with obstinate resistance from religious sentiment, the changes have taken place without permanent injury to religion.

It is in Lyell's character as a scholar and writer, however, quite as much as in that of thinker and observer, that his influence has been and will be felt. His style reveals the man in its calm, clear, scholarly spirit of accuracy. His sentences win confidence and disarm prejudice by their entire freedom from overstatement and advocacy. The man revealed by the style is a model of the qualities in mind and character which distinguish the highest modern social and scientific culture. A tender regard, akin to reverence—to reverence without servility—toward established standards of custom and opinion, kept him, while a Liberal in politics, religion, and science, very far from radicalism in any direction. He was a warm friend of America, and, during his two visits to this country, endeared to him many personal friends. He was married to a lady whose father was also distinguished in geology, Mr. Leonard Horner, formerly a president of the Geological Society, and especially distinguished in the annals of science for the researches for a chronological standard in geology in his examination of the age of the deposits of the Nile mud. Lady Lyell, whom death removed

from her illustrious husband two years ago, had been to him a most devoted and efficient helpmate, through powers and interests trained in the same direction, and by an amiability akin to his own. Sir Charles Lyell was born in Scotland, educated at Exeter College, Oxford, and called to the bar. He was knighted in 1848, and was created a baronet in 1864.

## ENGLAND.—THE COMING MEASURES.

London, February 13, 1875.

THE measures promised in the Queen's Speech are all of the domestic type. They are, indeed, more the sort of measures that one would look for from a parish vestry or a board of guardians than from the British legislature. Alterations in the arrangements of the law courts ; improvements in the dwellings of the poor ; amendment of the law relating to public health and regulating the pollution of rivers ; the registration of friendly societies; and the establishment of a public prosecutor—these are the unobtrusive measures which are to be proposed this session. It is not an ambitious programme, though it contains many useful and some necessary improvements. But no party feeling can be aroused by such schemes as these. The Law Court Bill is a remnant from last session, and indeed from the last Parliament. It would have become law last year but for the interposition of the ecclesiastical excitement, which, like Aaron's rod, swallowed up all the tame, decorous measures which had the bad luck to come in its way. Introduced as it has been in the House of Lords, at the very beginning of the session, it can hardly fail to receive the royal assent this time.

The necessity for a bill for the improvement of the dwellings of the poor is universally admitted. No one who has lived in one of your fine modern towns can form a notion of the squalor and wretchedness of the dens in which the poor of London, and of most of the large towns in this country, spend their days and nights. The medical officer to the local Government board has reported that in numerous towns the poorer houses are utterly unfit for human habitation, and that they are worst of all in London, Bristol, Merthyr, Newcastle, Plymouth, and Sunderland. In Liverpool, however, in which the most brutal population in the British Islands is congregated, the density of population is double that of London. Thirty thousand families, or (allowing five individuals to a family) one hundred and fifty thousand people, live in single rooms, of which fifteen thousand are dark, filthy, undrained cellars. In Manchester, which is not one of the six towns mentioned by the medical officer, carefully computed statistics, extending over the past ten years, show that, whereas the annual mortality in its healthiest parts is only four in 1,000, it amounts to seventy per 1,000 in its most crowded parts, which, considering that twenty per 1,000 is the normal rate of mortality, is almost enough in itself to prove the necessity of some such measure.

The bill empowers the local authorities in towns with a population exceeding 25,000 inhabitants to reconstruct the worst part of such towns, with money borrowed from Government, at three and a half per cent., on the security of the rates and the new buildings to be erected. The importance of such a measure as this is obviously great. But it would have promised to be more effectual if the provisions had been compulsory instead of being, as they are, permissive. Local authorities in England are difficult to move in any matter, especially in sanitary matters, which may involve expense. Rates are annually increasing all over England, both in town and country. It is obvious that a measure of the character of this Government bill cannot be effectually carried out without considerable expenditure, and considerable expenditure is precisely what most local authorities, except in a time of panic, are most desirous to avoid. The question of permission or compulsion will doubtless be raised when the bill gets into committee, and it will be decided by what it is customary and courteous to call the wisdom of Parliament.

In April, 1872, Mr. Disraeli, as you may remember, went down to Manchester, and there, in the Pomona Dancing Saloon, he made a great effort to resuscitate the fallen fortunes of Conservatism. It seemed a thankless and a hopeless mission, and the means which he took to raise his party from the dead, though admittedly original, did not appear to Liberal politicians and journalists calculated to be successful. He announced the hackneyed doctrine that cleanliness was next to godliness, and travestying the words of "The Preacher," instituted the cry of "Sanitas sanitatis, omnia sanitas" as the watchword that was to bring the Tories back to power. Many not unsagacious men laughed at the jingle of words, and thought that the old Tory party—the party of Pitt and Grenville—were indeed sunk deep in the miry clay when they had no better policy to offer against the blazing principles of Liberalism than a policy of the common sewers. But Mr. Disraeli was wiser than they. He twitted the Government on the preference they showed for the ballot over the health of the people, and now that he is in power he takes the earliest opportunity, with the approval of all, of acting up to his convictions. The "Artisans' Dwellings Bill" is the first instalment of this new Tory policy. The remaining schemes have not yet been laid before the House. But the fact that a bill for the regulation of the pollution of rivers is to be one of the principal measures, is an indication that the policy is to be pushed in an enlightened spirit. It is no exaggeration to say that, excepting some streams, or "becks," as they are called, in the mountainous parts of Cumberland and Westmoreland, known as the Lake District, there is hardly an unpolluted river in the whole of England. Between the sewage of towns and the offscourings of manufactories, distilleries, breweries, and the like, every stream and river in the country is poisoned and rendered unfit for domestic use. Sparkling brooks that not many years ago were frequented by speckled trout and silvery salmon are now transformed into gigantic cesspools, which a clean-living toad would be ashamed to haunt. No wise man or woman will touch a drop of London water until it has been boiled and filtered, and even then they will use as little of it as they can. Most of the houses are supplied with water from the river Thames. But the river Thames carries away in its tawny bosom the sewage of Oxford, a town of nearly 35,000 inhabitants ; the sewage of Reading, with 32,300 ; the sewage of Windsor, with 17,000 ; the sewage of Richmond, and a host of smaller towns, before it reaches London, and the water which is laid on in even the best houses of Belgravia, and South Kensington, and Mayfair, is all drawn from this polluted, filthy source. The manufacturing interest will no doubt be roused if any attempt be made to interfere with their prerogative of public poisoning. But the good sense, not to say the newly-awakened terror, of the country will support the Government if their measure be wisely considered, and be calculated to promote the end it has in view.

It is not likely that the appointment of a Public Prosecutor will be effected this session. The proposal raises wide questions upon which every one feels himself qualified to speak, and England clings tenaciously to the barbarism of private prosecutions. In most countries with any title to civilization, criminal charges are investigated and prosecutions are conducted by the state and paid for by the state. If you cross the river Tweed on the east, or the river Esk on the west, and enter Scotland—a part of the British Empire which Englishmen, at least, do not recognize as more civilized than their own country—you find a state organization of the most efficient kind, reaching from "Maidenkirk to John O'Groat's," and penetrating into the remotest corners of the country, and kept up exclusively for the detection and prosecution of crime. If a man shakes his fist in your face on one side of the Border, you complain to the public prosecutor of the district, and your assailant is indicted and tried at the public expense, and without any trouble to his victim. But if you are robbed and murdered on the other side of the Border, your representatives must bear the expense and the worry of bringing your murderer to justice. The state will not raise a finger or spend a penny to help them. Several attempts have been made of late years to get rid of this anomaly. But its roots are deeply embedded in English institutions, and the proverbial conservatism of the legal profession, wherever their interests or privileges are concerned, has hitherto been too powerful for the reformers. The present Government is strong enough to carry such a measure in spite of the lawyers, if it chooses to use its strength. Whether it will so choose or not, time will show.

On none of these measures can party passion be aroused. Both sides of the House are equally desirous that they should pass, and it is improbable that any factious opposition will be raised against them. It is in the minor matters that the present Government gives free vent to the good old stiff-necked Tory spirit. Last session it was a fourth-rate measure that discredited them, and brought together for a brief moment the scattered forces of the Opposition. This year Mr. Gathorne Hardy has introduced a trifling bill of a single enacting clause, "A bill to amend the law relating to Regimental Exchanges," which has already raised to a white heat the smouldering fires of the recently "consolidated" Liberal party. The clause is as follows :

"2. Her Majesty may, from time to time, by regulation authorize exchanges to be made by officers in her Majesty's Regular Forces from one regiment or corps to another regiment or corps, on such conditions as to her Majesty may for the time being seem expedient ; and nothing contained in the Army Brokerage Acts shall extend to any exchanges made in manner authorized by any regulation of her Majesty for the time being in force."

The effect of this clause would be to revive by a side wind some of

the worst evils of the purchase system in the army which was abolished by the Gladstone Government. If officers of one regiment, it is said, are to be legally entitled to bribe their poorer brethren in other regiments to exchange with them when they are ordered to dangerous or unpleasant stations, the old demoralization of the army will reappear. Rich men will remain in comfortable quarters among the clubs and luxuries of London, while the poorer men will do the work abroad and in India, and all the old underhand, backstairs influences which were supposed to have been rooted out of the army will grow again, if this bill should become law, to the grave detriment of the service. So the purists and the job-hunters are asserting in the lobbies of the House of Commons. Already three ardent army reformers have given notice of motions to reject the bill. The new leader of the Opposition has openly announced his hostility to the proposal, and a right good party fight upon the second reading of the bill, next Monday week, is confidently anticipated. Of course the Goverment will win, but the battle-ground is astutely chosen.

One other measure, emanating not from the Government but from a private member, will open the door to party strife. The bill to enable Dissenters to be buried in consecrated ground, and in accordance with the traditions of their respective denominations, is stoutly opposed by all the Churchmen in the House of Commons. The same feeling that animated a "learned simpleton" in the east of England to refuse his permission to the word "reverend" being placed upon a Wesleyan minister's tombstone, animates a large number of the representatives of the English people. The Churchmen are principally massed on the Tory side of the House, and it is expected that Lord Hartington, who is no bigot, will lead a fairly compact body of his followers into the same lobby with the introducer of the bill. Even if he were successful, which is highly improbable, the bill would have no chance, as the House of Lords would strangle it on its first appearance in their House. The Bishops would rise *en masse* to vindicate the sanctity of their churchyards, and the vast majority of the temporal peers would hold it desecration to allow the rights of Christian burial after the Episcopalian form, and in a consecrated churchyard, to be performed over a Dissenter. But, successful or unsuccessful, the Liberal managers would justly hold it a good party move to show some fight upon such an occasion. Except on these two measures there seems little scope for serious opposition. But in the game of politics as played in England, more than in any other pastime, you cannot tell what a day will bring forth. The calm despair of the Liberal benches may be aroused into active passion before the end of the session. At the eleventh hour some retrograde measure like the Endowed Schools bill of last session may be introduced, or ecclesiastical hares may again be started and hunted to the death. At the present moment it would appear as if the session would be one of little measures, but if the programme be carried out the public will be the gainers, and the Government, if it does not gain a crown of glory, will justly earn the civic wreath.

# Correspondence.

## ABOUT FIRST-MORTGAGE RAILROAD BONDS.

To the Editor of The Nation:

Sir: That cynical Frenchman Talleyrand says that business, in France, means getting all you can out of "l'argent d'autrui"—"other folks' money." Can it be the same in Wall Street, and even in the sacred haunts of Mammon at the "Hub"? The revelations at the late meeting of Dubuque bondholders certainly look so, and Mr. James F. Joy, the late railroad king of the West, testifies that the Dubuque method is the usual way of building railroads in the West. It is his idea of "business."

Let us look into this "business" a little. It has grown from small legitimate beginnings to an enormous system. It was natural that the towns and farmers of the West, where production is enormous and dirt roads impassable half the year, should want railroads within easy reach. They were, and are, on the prairies the farmer's great labor-saving machines. Within proper limits, the people of the prairies could well afford to club together their money and their labor and do a good deal towards getting a road ready for the ties and iron. They could well afford to take railroad stock and pay for it in money and labor, or vote county bonds in aid of the project, even if they never got any returns for it except in the enhanced value of their farms or other property.

In this way some very few successful roads have been built, and some others have proved to be worth the bonds issued to complete them; but in the long run and the majority of cases, this system of building has chiefly enured to the benefit of contractors and speculators associated with them. However legitimate and plausible in theory, it was always dangerous in practice, and in 1871 it had grown to be the giant evil of the railroad system. It was, let us be thankful, killed by the panic of 1873, of which it was one of the causes, and by the Granger folly now happily dying out. We hope and believe the system thus perverted is dead beyond resurrection, but with such a glaring instance of its bad features as the Dubuque roads furnish we ought to learn the lesson well and lay it up for warning in the future.

What is its practical operation? From the legitimate attempts of agricultural localities to build railroads let us look at the outgrowth. Encouraged by the success of a few roads thus built, contractors who have made money out of them commence operations. Aided by local landholders, country storekeepers, and others with more enterprise than capital, they get together funds enough to make the rough preliminary surveys. These for the sake of securing local subscriptions are often run round close to everybody's farm or town lot; sometimes a small land-grant is obtained, and what is called "tax aid" in the shape of town or county bonds is voted by the inhabitants, either as a bonus or to be returned in stock of the railroad. If the prospect seems favorable, the contractors sometimes muster funds or get contributions of labor enough to run a few furrows with an ox team and a deep plough. This is called grading and ditching the road, and the nominal value of the labor and tax aid often reaches large amounts, and figures in the coming programme as "large local stock subscriptions." Armed with this array of "margins" the contractor waits upon some railroad king, and tells him the road is going on rapidly "towards" completion—"the grading nearly all provided for" and nothing needed but a capitalist to furnish iron and equipment. If skilful, he hints that a neighboring rival king is negotiating for the control of the road, but that his friendship for the nearer monarch, or perhaps his loyalty purchased by previous similar favors, leads him to give King A the preference. Sometimes he adds, as an inducement, that if the king and his cabinet will join in the enterprise, he will give them a share in the profits of the contract in the shape of land, local aid, stock, etc. The contractor and railroad potentate have now on paper all the elements of success, and need only Talleyrand's lesson as to getting hold "of other folks' money" to carry out their scheme. To accomplish this they skilfully distribute the contract "where it will do the most good," amongst capitalists who, by leading off on the subscription-list for the bonds to be issued for carrying out the project, are most likely to gather in "other folks' money." These capitalists are deceived; not intentionally by the railroad king, because his head may perhaps have been turned by previous success. They are made to see a very good thing for themselves—a good feeder for the first-class road in which they are directors, and they hope the public, including the widows and orphans who are pinched for income, will get 8 or 9 per cent. for their money instead of 6 or 7. The contractors' intentions are good. The potentate's intentions are good. The intentions of other credulous directors are good. The intentions of the portion of directors who compose the "ring" are good; but it is well known that hell is paved with good intentions, and this kind of paving, unless laid upon a firm substratum of "good works," is pretty sure to make a road that leads to the devil.

Let us pursue the process a step further—and we could not have a better specimen brick than the Dubuque roads, engineered as they were by the able and naturally honest King James. The enterprising town of Dubuque wants some more railroads, and goes through some of the preliminaries we have hinted at for bringing their project to the attention of King James. The king comes East with his array of figures—he wants at first only $2,400,000, of which his ring, having first secured an interest in the contracts, take $800,000, thus setting an example of "faith," and strongly recommend to their stockholders the other $1,600,000, which is readily taken, and, owing to the confidence placed by the community in the statements and recommendation of the ring, even commands a premium in the market on its subscription price. Trusting entirely to their Western king, the cabinet exercise no further vigilance, and take no further precautions, but put the $2,400,000 at his disposition, to be turned over with similar recklessness to his local viceroy, who perhaps rewards all *his* friends with fat subcontracts, and certainly adorns his own town with magnificent machine-shops as an earnest of the railroad structures that are to come when Dubuque becomes a second Chicago. Encouraged by his success and stimulated by the handling of so much money, our viceroy projects another road to the West, the Iowa Pacific, in which he doubtless has his "Crédit-Mobilier" contract. He also takes up a project for a road south of Dubuque to Clinton, already under way, and a few months later our king returns East with a still more magnificent scheme, of a sixty-mile branch, intended to reach the Iowa Pa-

cific, and a sixty-mile extension south, requiring now only three millions and a half more bonds, underlaid of course with a contract similar to the first, spiced this time with a land-grant of 40,000 acres and other enticements for his friends of the ring.

The same game is played in recommending and placing the bonds. The contractor-viceroy spends the money like a prince as he is, and now, having fairly begun his Iowa Pacific, very naturally, and without meaning to steal any part of them, expends $173,000 of the funds entrusted to him upon that. *His* intentions, too, are good, namely, first, to feather his own nest as contractor, and next to benefit the river roads by giving *them* a new feeder. He then buys on credit (with perhaps a lien on it) the rolling-stock which he was bound to furnish as part of his contract. Under such a system the money of course wastes away like a snow-bank in May. The eastern end of the "Crédit-Mobilier" concern, when collapse comes, finds itself loaded down with the bonds, only a part of which they have been able to put off on the public, and so they are "sufferers who have been deceived," and think themselves rather objects of sympathy than of blame.

Upon another point the lesson is instructive. Trustees, professional men, widows, orphans, are led on by the shrewd capitalists, who show their faith, as Mr. Joy says, in the best way any man can do it, "by putting their money into it." Led on by this example and the delusive cry of "First mortgage bonds," they put their money into enterprises in which they would never think of taking stock, and yet they would have been ten times safer to have had stock if they had only assumed the management of it as stockholders and seen to its proper use. Instead of this they furnish the money, and let a set of speculating contractors mismanage it by the power of the stock which these have got for almost nothing.

Following out the Dubuque precedent, another danger is developed. The contractors take all the stock, and of course control or themselves become the "Board." They are at first bound by their contract to build the road, receiving therefor stock, land and local aid, and $25,000 of bonds per mile of "well-equipped and well-built roads." This will do pretty well when they are only local contractors, with no great pecuniary responsibility, but when they want to get in the Eastern ring with some real capital and much credit, a new feature is added to the contract—they are still to get all the assets of the road, including $25,000 bonds (first-mortgage bonds, mind you) per mile, *but are released from any obligation to build the road*—which the company must accept when the contractors have expended certain assets on it, whether complete or not. The Board (being in fact the contractors) do not examine whether the assets have been properly expended on it as provided in the contract, and even knowing that large sums have been unlawfully diverted to the building of another road, they accept the road and release the contractors, and instead of 237 miles "of well-built and well-equipped road," they receive only 182 miles of finished road with its machine-shops, after vast outlay only half done, and with its equipment and the road itself loaded with a large floating debt.

It has been argued that the value of the bonds is improved by having a certain sum of money put in behind them by a contraction company, and that such contracts as we have been discussing are perfectly fair if properly executed. Is this so? Take the Chicago, Clinton, and Dubuque case as an example: The contractors agree to put in $140,000 in money, for which they get 38,500 acres of land, worth, at their own valuation, $3 to $6, or say an average of $4 50 per acre—$173,000; and in addition all the stock, amounting to over $1,200,000. They thus take out of the enterprise more money value than they put in, with the chance of making a large sum in building the road and with an absolute release from any obligation to complete it. Hence the contract was a bad one, however well executed, besides having the vicious feature of making the contractors (in their capacity of directors) the judges of their own work, thereby removing every safeguard for its proper execution. However this may be in theory, we have seen in practice what waste, misapplication, and ruin come of allowing directors to use other folks' money in enterprises in which they themselves take the first chance of profit, giving to the public what chance is left of getting any interest on the money invested. Are we in this state of facts to have a verdict of "nobody to blame"?

GOOD INTENTIONS.

# Notes.

THE Rev. E. D. Neill, well known for his historical writings relating to the early settlement of Maryland, has reprinted from the St. Paul (Minn.) *Pioneer*, under the title 'Maryland not a Roman Catholic Colony,' three letters recently addressed to that paper. This little pamphlet forms part of the literature of the civil-allegiance controversy, as its object is to confute Bishop Gibbons, of Virginia, one of Mr. Gladstone's antagonists, who had claimed the Maryland General Assembly of 1649 as a Catholic Assembly (it was two-thirds Protestant), and the toleration act of that year as a manifestation of the spirit of the Catholic Church (it was an adaptation of the act of 1647, passed by the Puritan Parliament of England).——A new monthly *Journal of Education*, "devoted to educational interests, literature, science, and art," is announced to be published in Brooklyn during the present month.——The Agassiz Memorial Fund of $300,000 is said to be nearly raised. The "teachers' and pupils' fund" alone exceeds $9,000, the largest contribution ($2,555 07) naturally coming from Massachusetts. Illinois is second with $1,982 54, New York third with $1,106 97; Missouri and Maryland follow next with $882 79 and $815 33 respectively. No other State gives as much as $250. Pennsylvania ($108 81) falls behind Rhode Island ($140 05).——We have received from Mr. Edward B. Lasalle, C.E., of San Francisco, his pocket-map of Virginia City and the Comstock Lode, showing the latest changes up to January 1, 1875. It appears to give all the surface information that one could desire. For the underground workings of a part of the lode one may consult Mr. Clarence King's Mining Atlas (1870).——In the October *Bulletin* of the Essex Institute occurs an interesting statement by Prof. E. S. Morse, viz., that "the American Indians were acquainted with the fact that the glacial scratches on ledges and boulders run north and south, and that they used them as a guide." This he learned "from an old gentleman at Portland, whose grandfather remembered that the Indians sometimes found their way through the forests by scratching away the earth over the rock in order to note the direction of the smooth scratches."——The period of Italian history from the battle of Novara to the insurrection at Genoa has just been made the subject of a work by General La Marmora. It is entitled 'Un episodio del risorgimento italiano,' and but one hundred copies have been printed.——Scribner, Welford & Armstrong have secured for the American market a special edition of Schliemann's 'Troy and its Remains,' which will very shortly be issued from the press, illustrated with maps, views, plans, etc.——Dodd & Mead announce Dr. John Hall's 'Yale Lectures on Preaching'; Dr. Storrs's 'Preaching without Notes'; and an account, by Mr. George H. Stuart, of the revival in England and Scotland now going on under the labors of Messrs. Moody and Sankey.——Albert Mason will publish the second series of French's 'Historical Collections of Louisiana and Florida.'——G. J. Whyte-Melville's horsey tale called 'Katerfelto' will be republished by Porter & Coates, Philadelphia.

—English publishers' announcements include a work by Kegan Paul on 'William Godwin, his Friends and Contemporaries,' which will contain a number of hitherto unpublished letters from many literary celebrities; a complete edition of Wordsworth's prose works, political and other; a life of Fénelon, by the author of a recent life of Bossuet; a memoir of Sir Roderick Murchison, by Archibald Geikie; 'Insectivorous and Climbing Plants,' by Charles Darwin; poems by W. B. Scott, illustrated with seventeen etchings by the author and by L. Alma-Tadema; 'Aristophanes' Apology,' by Robert Browning; 'Life and Works of Titian,' by Messrs. Crowe and Cavalcaselle; 'A History of Indian and Eastern Architecture,' by James Fergusson; 'Ecclesiastical and Secular Architecture of Scotland,' by Thomas Arnold; 'A History of Ancient Egypt,' by Prof. Brugsch; 'Studies from Genoese History,' by Colonel G. B. Malleson; and a 'Dictionary of English History.'

—A subscriber writes us from Boston: "In illustration of what your correspondent says of borrowers of the *Nation*—my copy goes to two families in Massachusetts, after my household has read it, and then to an American family in Japan. Still, I do not think the proprietors lose by it, for I doubt if these families could afford the subscription, and it gives circulation and credit to the journal."

—In *Lippincott's* for March, the paper on "Munich as a Pest-city" is as likely as any other to be read and remembered, especially by intending tourists in Germany. Why that city has an exceptionally bad reputation as the nest of cholera and typhus, why "diseases of the throat and lungs are very common," and why "the whole population suffers more or less from catarrh," is explained by the writer in a way to carry conviction. The situation of Munich—"upon a high, barren plain, sixteen hundred feet above the level of the sea, exposed to the full power of the sun in summer, brooded over by chilly fogs in spring and autumn, and swept the whole year through by all the storms that accumulate upon the mountains filling the horizon to the south and east"—seems cause enough for a large amount of sickness and mortality, and a permanent and immitigable cause of both. The soil is an equally fatal factor, having once been the bed of a lake, and consisting

to the depth of several feet of a loose gravel, in which no useful or ornamental vegetation can be made to thrive except by artificial aid, and through which all fluid-matter deposited on the surface percolates to the rocky substratum, and there stagnating generates poisonous gases. Scarcely a third of the seventy-five thousand tons of refuse matter annually thus deposited is taken out of the city. Sewers are of very recent introduction, and, being imperfectly constructed and not systematically flushed, rather serve to aggravate the evil of the undrained soil. The state of the city cellars, generally shared in common by the occupants of flats, and permitted to be used even for butchering; the crowding and frequent upturning of the cemeteries; the foulness of the water, which is drawn from wells "in close proximity to the vault, the refuse-pit, and the drain"; the imprudent open-air habits of the population, their indifference to pure air and to cleanliness within doors, their bad diet—are still other counts in this sanitary indictment, evidence of the truthfulness of which is to be found in the fact that nearly half the children born in Munich die in infancy, and that "the death-rate for the whole population is nearly forty in a thousand." It was in a street bordering on the English Garden that the cholera broke out in 1873, and that Kaulbach sickened and died of the disease. The writer's account of this park would seem to be somewhat darker than was necessary; at all events, it is in marked contrast with the description of the same pleasure-ground given by an American consul in Ellis's life of Rumford, to whom Munich is indebted for it. Doubtless, if the Count were alive to-day, he would be as prompt to recognize and strive to improve the sanitary condition of the city as the present authorities are slow in dealing with it.

—Mr. Richard Grant White contributes an article to the *Galaxy*, in which he suggests a question with regard to music which would probably stand much more discussion than it has ever received. Every one knows, Mr. White says, that there are various kinds of music, vocal and instrumental, ecclesiastical and secular, lyric and dramatic, choral, orchestral; music grave, gay, lively, severe. But the question has been asked, Is there a distinction between "absolute music"—*i.e.*, music as such, consisting of melody and harmony, and having absolute, intrinsic, musical beauty, and another kind of music known to the vulgar as "programme music," which Mr. White proposes to call dependent as opposed to absolute—*i.e.*, music which of course must consist of harmony or melody, or both, but which appears not for its own sake but to illustrate some printed words or statements of the composer, and which, apart from this programme, is meaningless and uninteresting? Everybody who goes at all to concerts will recognize the distinction between the two kinds as being at the present time a very real one, inasmuch as one is the sort of music which one ordinarily listens to with pleasure, while the other is the kind which necessitates a careful, laborious, and continuous study of the programme as long as the music lasts, and involves also grave doubt, in the case of persons unscientifically musical, as to whether they really have detected, as they were in duty bound, the neighing of the horses in the sounds emitted by the oboes, or the spectral shriek in the violins, or whether they have not really confused the whole thing, so as to be carefully following the *menu* of the first part when the music has already got into the middle of the second. We join Mr. White with great pleasure in his attack on "programme" music when carried to the modern extent, simply on the ground of the amount of physical and intellectual labor involved; but it seems to us that he makes too much of the distinction when he says that it constitutes a "revolution" in æsthetics. Some relation of dependence has been always admitted to exist between music and words. In fact, the existence of opera of any kind is proof of the possibility of using "dependent" as well as "absolute" music, and though there is a great deal of music in operas which bears little or no relation to the accompanying words, it cannot be maintained that composers generally, when writing operas, have written "absolutely," any more than music composed for the words of a particular poem can be called "absolute." In the non-absolute music of the past, however, the connection between the two has in most cases been kept up by making the music the principal, and the words accessory or dependent. What is proposed, as we understand it, by "programme music," is to reverse this order and make the music dependent on the words, which we believe will be found in the long run to be a mistake, for the reason that music is incapable of expressing and representing thought, line for line and word for word, and can never do more than suggest and harmonize with the general feeling expressed by the words. In the operatic music of the past there has been, no doubt, a great deal of melody the sentiment of which was wholly out of sympathy with the words, of which fact Mr. White gives some curious illustrations.

—The last *Atlantic* contains an ingenious article by Mr. Jules Marcou on "The Origin of the Name America." *Americ*, *Amerrique*, or *Amerique*, he says, is the native, aboriginal name for the high land in Nicaragua, lying between Juigalpa and Libertad, and reaching on the one side into the country of the Carcas Indians, and on the other into that of the Ramas Indians—the highest chain of mountains in the countries of these tribes, and a dividing line between the waters flowing into the Atlantic and those that empty into the Lake of Nicaragua. It is well known, Mr. Marcou says, 1st, that the termination *ique*, *ic*, in the Indian dialects of Central America, is applied to elevated, mountainous countries, or to dividing ridges; 2d, that no denominations are more firmly established than the names of localities, such as those of mountains, valleys, lakes, and rivers. "Even the most absolute conquest, unless it totally exterminate the aboriginal race inhabiting a country, does not destroy entirely the names of localities, or *lieux-dits*, as the French so well express it. These names may be slightly modified, by various spelling, but the primitive sound remains. And even where the aboriginal race entirely disappears, the names of places are often preserved, at least as synonyms; of which there are many examples in Canada, in New England, in the State of New York, and elsewhere throughout the Union." But in the *Lettera Rarissima* of Columbus, giving an abridged description of his fourth voyage (1502–3), he speaks of passing the Cape Gracias a Dios, on the Mosquito coast, and reaching the Rio Grande Matagalpa. After remaining there for several days, he stopped some time between the Island of La Huerta (the Garden Quiribiri) and the continent, opposite the village Cariaï, or Cariay. Columbus and his company were in search of gold mines, and of these the inhabitants of Cariaï (which is so like Carcaï that we may suppose the change to have come from an error in reading the manuscript letter of Columbus) had a great deal to relate. They led Columbus to another village called Carambaru, where the inhabitants wore golden mirrors round their necks. These Indians told them of several places where gold existed, one of them being Veragua, twenty-five leagues distant on the coast. Following these indications it seems highly probable that Columbus visited the gold mines, where the Carcas Indians are still working to-day, at the foot of the Americ mountains, a conspicuous range, with white cliffs, precipitous rocks, and huge, isolated rocky pinnacles; that he there repeatedly heard the Indians refer to these auriferous mountains, and give their name in reply to questions about gold, and finally, "We may suppose that Colombo and his companions on their return to Europe, when relating their adventures, would boast of the rich gold mines they had discovered through the Indians of Nicaragua, and say they lay in the direction of Americ. This would make popular the word Americ, as the common designation of that part of the Indies in which the richest mines of gold in the New World were situated." In this way the word Americ might have penetrated very far as a popular equivalent of the El Dorado on the other side of the Atlantic, until Hylacomylus of Saint Dié, at the foot of the Vosges, having heard the name, but being ignorant of any printed account of these voyages, except those of Albericus Vespucius, published in Latin in 1505, and in German in 1506, thought he saw in the Christian name Albericus the origin of this queer word Americ, and therefore called the country America. To corroborate this, Mr. Marcou says that Hylacomylus knew only the names Albericus and Alberico, the name being only spelt Americo and Morigo in Spanish documents that remained unpublished until many years after the death of Hylacomylus. The whole argument is of course inconclusive, in the absence of positive evidence, but it is a curious chain of probabilities, which are heightened by the circumstance that the Christian names of ordinary men are never used to designate a country, but only those of an emperor, king, queen, or prince. "Thus we say Straits of Magellan, Vancouver's Island, Tasmania, Van Dieman's Land, etc., while we have, on the other hand, Louisiana, Carolina, Georgia, Maryland, Filipinas, Victoria, etc. There is no exception to this rule in the case of Cristoforo Colombo, for no one has thought of giving the name of Cristoforia to a country, and that of Cristoforo to a town; while at several epochs many names of Colombia, Columbia, Columbus, and Colon have been given. Furthermore, in giving to Vespuzio the honor of naming the New World, Hylacomylus, using the Christian name contrary to all precedent, should have named it Albericia or Amerigia or Amerigonia or Morigia, and not America."

—When Mr. Forster was here the Union League Club gave him an entertainment, in the invitations to which he was spoken of as "the Honble. William E. Forster," a mode of styling him which called forth some criticism, inasmuch as his proper title is the "Right Honorable William E. Forster." The Easy-Chair in *Harper's Monthly*, speaking of the matter, however, says "Honorable" is not the correct term to apply to members of Parliament, as we apply it to members of Congress; which we think shows

some misapprehension as to the exact nature of the breach of etiquette which the Union League Club committed. Members of Parliament, as such, are not entitled to any sign of superior dignity whatever. The letters "M. P." are generally appended to their names, but this is simply description. They become neither "Honorable" nor "Right Honorable," nor anything else, in virtue of their office. "Honorable" is, in England, an appellation reserved for the younger sons of peers, from earls to barons; it is not a mark of office of any kind, but of birth only. The title of "Right Honorable," which Mr. Forster should have received, came to and cleaves to him as a member of the Privy Council. Every cabinet minister becomes a member of this Council, and the Cabinet, though only a portion of the Council, has in modern times, as all students of English constitutional history know, taken the place of the Council and discharges its duties. When a man, therefore, obtains a seat in the Cabinet he becomes a Privy Councillor and a "Right Honorable," and as he continues, even after the ministry to which he belongs goes out of office, to be a Privy Councillor during the King's pleasure or for six months after the demise of the crown, a "Right Honorable" he remains. But the whole council is never called together except on the accession of a new monarch, and none of its members are ever summoned on ordinary occasions, except those who belong to the Cabinet for the time being.

—We wish to call the attention of those who are interested in libraries to the plan for a catalogue proposed by Mr. J. Schwartz, jr, of the New York Apprentices' Library, partly because his system is novel and important, and partly because he is one of the few men who have an idea of what a catalogue ought to be, and why. The public, of course, do not know much about the principles of cataloguing, nor is it necessary that they should. Enough for them to consult with more or less dissatisfaction the catalogues that are set before them. But librarians might have been expected to penetrate a little deeper into the mystery. Apparently they do not. In his bibliographical education each becomes familiar with some system, and when he makes a catalogue adopts that without much question. And those who think for themselves appear to turn their attention to one part of the subject or to overcoming one class of difficulties, rather than to the general theory. Prof. Jewett's chief work, for instance, was in drawing up the rules for an author-catalogue, and he seems to have apprehended the principles of a subject-catalogue somewhat indistinctly. The makers of dictionary catalogues seem to have been especially impressed with the usefulness of title-entries. Prof. Abbot's main attention (the author-part not presenting much further difficulty) was given to the subject-part, and in the report in which he explained his system he dwelt mostly on the points which distinguish that from the same part in other plans. But whether or not he worked from a definite statement of the purposes of a catalogue, he evidently had in his mind a strong feeling of the objects to be accomplished, and his system provided for answers to all the five questions which a catalogue ought to answer—which no previous one had done.

—Mr. Schwartz was called upon to devise a plan when totally ignorant of library economy, and, after examining the principles at the bottom of previous systems, proceeded to form a new one *à priori*. Each previous system seemed to him to have been made to attain a certain result; by combining them, he could obtain all possible results: a classed index would assist those who knew the subject of their book; a title-index would serve the man who remembered the title of the book he wanted and that only; an author-catalogue would guide the more numerous multitude who want the works of a given author; and, he says emphatically, "if a reader does not know one of the three factors of a book, the *author*, *subject*, or *title*, *no* catalogue can assist him." He had already formed a very ingenious and practically successful system for the arrangement of books by combining the three ordinary systems, topical, numerical, and alphabetical, and probably the idea of a second trio was pleasing; but his formula was not broad enough. A good catalogue ought to state not merely what books the library has by a given author, or with a given title, or on a given subject, but also what works it has in a given kind of literature, as French or German, fiction or drama. The trio should be a quartette. In Mr. Schwartz's system there is a place for the kinds of literature, but none in his statement of principles; apparently he builded better than he knew. However this may be, Mr. Schwartz's scheme, in which he endeavors to harmonize and absorb the previous systems of arranging the books, constructing the catalogue, and recording the loans, is a very important contribution to library economy, and deserves careful attention. It would not, indeed, be necessarily any better for being constructed *à priori*, any more than the paper constitutions which the Latin races have made so freely on philosophical principles are more serviceable than the empirical constitution of England, but it is more satisfactory to the maker and to the critic. Mr. Schwartz by no means casts aside experience, but tries to profit by the work of his predecessors, intending to include in his all their systems, and assign each its proper place and work. The idea of the threefold combination is not absolutely new. Mr. Schwartz, however, with whom it is no doubt original, deserves the credit of bringing it forward prominently and of combining it with a scheme for an expansive arrangement of the library. It would be very unfair to judge him by the catalogue which was published in 1874 after a wonderfully quick preparation, and with a crude and unsatisfactory scheme of classification. He is now preparing a pamphlet in which his plan will be set forth in full, and with such modifications and improvements in detail as its practical use has suggested.

—The experiment of cheap workingmen's trains on the Eastern Railroad in Massachusetts has been on trial for two or three years, and it seems from the last report of the Massachusetts Railroad Commissioners to be an established success. The trains leave Lynn for Boston at 5.35 o'clock every morning, and returning leave Boston at 6.35 in the evening, the fare being uniform, whether for the entire trip or any part of it. In 1870, these trains carried 187,016 passengers, and in 1874, 266,560, the receipts from them in 1870 being in round numbers $9,350, and in 1874 $13,325. The tickets for these trains are sold only in slips of twenty each; no money is received on the cars, and the average receipts for the year per trip proved to be $21 29. The cost of running one of these trains from Boston to Lynn appears, by the returns of the road, to be $14 14, and therefore it seems that the cheap train earns a profit of $7 15 per trip, or 55 cents per mile run. If the rate of progress which has hitherto been maintained is continued, the indications are that in another year the Eastern Railroad workingmen's trains will be found to be among the most remunerative, per mile run, which leave the city of Boston. The only difficulty seems likely to arise from their unmanageable size. Beginning in November, 1872, with two cars only, they had increased in August last to eleven cars, and nine is now the usual number. At first, these trains seemed to be regarded with a certain popular suspicion, especially by women, who used them but little. This is now rapidly changing, numbers of women go in them, and generally the class of passengers shows a constant and decided tendency to improvement. The Commissioners also say that the statistics of the several stations served by these cheap trains show more clearly, the longer the experiment is tried, that the receipts from the regular trains are not diminished nor are passengers drawn from them; they have apparently "called a new class of travel into existence," which, if it has any effect on the regular travel, only stimulates and develops it. The travel of the cheap trains during the past year has increased 42 per cent., that on the regular trains increasing at the same time 23 per cent. The introduction of cheap trains has, in fact, largely extended on the Eastern road the area in which labor can seek employment. The workingman can now daily carry his labor to any point from Lynn to Boston; as a consequence, the population moves more, and large numbers of people acquire the habit of travelling who had not the habit before. All this of course enures to the profit of the railroad as well as to that of the workingmen; and the managers of the Eastern road have this year "evinced a lively interest in the results of the experiment, and show no disposition whatever to bring it to a close." The Commissioners, in connection with this subject, refer to the Revere accident as the real cause of the introduction of cheap trains. That accident, in which a large number of lives were carelessly lost, made the company very much disliked in Massachusetts, and the managers felt that something must be done to "render the corporation popular." They therefore resolved to adopt the recommendation of the Commissioners and try cheap trains. The other corporations, which have had no accidents, show no disposition to follow their example, but maintain that there is no popular demand for such trains; that the population living along the line of the particular road to which the Commissioners address suggestions is "very peculiar"; that the change is either not desired or would be "most offensive" to it; and that any changes would occasion "great popular discontent." We commend this subject to the attention of those who are investigating rapid transit in this city, for there are few cities in the world in which the working population is so horribly and unnaturally crowded, chiefly owing to the fact that in the present state of affairs any rapid and cheap communication with distant places is just as much a physical impossibility as if there were a big wall, without any means of entrance or exit, built round New York. There is nothing that we can see to prevent the introduction of these cheap trains on the east side of the city as soon as the Harlem improvement is completed.

—We have more than once referred to the "Curtius Fund," raised among the philologists of the world as a well-deserved tribute to Professor

Georg Curtius of Leipsic, on the twenty-fifth anniversary of his work as a university teacher. His brief words of acknowledgment to the contributors to the fund have just come to hand in this country, and we learn from the little pamphlet that the American contributions form a very respectable proportion of the whole amount raised, being considerably more than twice as much as was received from all other countries outside of Germany, taken together; just nine times as much, it may be added, as went from England. In this hearty response to the appeal of the American committee, there is matter for gratulation, as it shows both the appreciation by American scholars of the distinguished merits of the great German teacher, and their readiness to join freely in promoting an object of which they understand the claims. Curtius has many personal pupils among our colleges, who regard him with affection and reverence, and who were active in their labors in his behalf; but they were met almost everywhere with a willing and hearty response, and the American contribution is to be regarded as a spontaneous and really intended tribute to the claims of the recipient. What rules will be adopted for the administration of the fund, and the application of its income to the encouragement of philological science, is not yet made public, but is promised soon to be so. Curtius is stated to be at present engaged upon the second and concluding volume of his work on the Greek verb, of which the first volume appeared in the summer of 1873.

—The second number of *Italia*, published the fifteenth of January, is before us, and will be found, we think, more generally interesting even than the first number. The literary and scientific articles preponderate; indeed, besides the review of the political condition of Italy by the editor, there is but one article that can be called political. This is by Luigi Luzzatti, on "The Schools of Political Economy in Italy and their Controversies." The first number, it will be remembered, contained an article by Barzellotti on the literary movement in Italy since 1848; the present number continues the series with an account of the philosophical movement in Italy since 1860, by F. Fiorentino. Of scientific interest is the notice of Odoardo Beccari's various journeys between 1865–1874 to Ceylon, Arabia, New Guinea, etc. Beccari is an eminent botanist, and few travellers of modern times have undergone such risks and accomplished so much satisfactory scientific work. One object of *Italia* being to acquaint the Germans with out-of-the way places where the national life can be best studied, it gives in an article by Zumbini an interesting account of the mountainous region of Sila in Calabria. Raffaele Pareto discusses the subject of the Roman Campagna, giving plans and statistics for its drainage. Woldemar Kaden, who has lately become well known by his vivid pictures of travel in Italy, describes the Sabine hills, which have exercised such a powerful influence on modern German landscape painters. Art is represented by Von Reumont's account of the Collegio del Cambio at Perugia, with its splendid frescoes by Perugino. The purely literary part consists in a notice by Lang of modern works on Machiavelli; the Italian theatre since 1848, by Yorick (Ferrigni); a story by Heinrich Horner, entitled "Der Säugling"; and, as in the last number, metrical translations from Italian into German and *vice versâ*. They are all interesting; perhaps the most so is an Italian version of Goethe's "Römische Elegieen," by Guerrieri-Gonzaga. The publishers have not yet fixed the time for the appearance of the following numbers. The next will, however, be issued in the course of the year, and will contain among other things an article on the musical condition of Italy.

—The death of Corot the painter, news of which came last week, is to be added, not without a certain melancholy harmony, to that of Millet, who died January 21st, and both assist in swelling a sad list of losses suffered by art in France since the war. Corot died at the age of about seventy-nine years, and Millet at that of sixty; there was a kind of sympathy in the broad, individual, and unconventional way in which nature was represented by both. Corot's landscapes are refined suggestions, delineating rather the impression made by scenery on a poetic mind than the facts of scenery; his representation of trees is the best possible definition of tree-painting as an art, distinguished from tree-drawing as botany. He excelled in effects taken from the twilight just before dawn, animated perhaps with a few hints of figures derived from the twilight of history or fable, such as satyrs, centaurs, or demigods; and he could paint, as none else could, the cloud of undeveloped leafage that settles upon a wood in the earliest spring. Millet painted the lives of the peasantry. With a scrupulous sincerity, he delineated the hardness and laboriousness of existence among the poor, yet with such mastery of selection and arrangement as made his groups intensely poetical. Since Rembrandt, probably no painter has so contrived to surround the miserable epic of poverty with such subtle chiaroscuro of fascination. Millet's delvers of the soil have a peculiar and most dramatic appearance of belonging to the earth, like gnomes, and to the general appearance of nature amid which their lives have been formed. It would seem, to look at them, as if they had never been studied by the painter as *académies* or anatomical problems, in the atelier or dissecting-room, but only in place, as a part of the landscape which they occupy with the rocks and the trees. He said himself that his mission was to deliver "the cry of the earth"; this he did with ineffable tenderness and melancholy. Numerous examples of the art of Millet and Corot are owned by collectors in this country.

## STUBBS'S CONSTITUTIONAL HISTORY OF ENGLAND.*

PROFESSOR STUBBS has long been known to be one of the highest living authorities on English history, and his book will not disappoint the high expectations of his friends. Many of its merits are patent on its face. It is filled with a mass of information rarely to be found in the pages of any English writer. The learning which is manifest in every line is not the erudition of a pedant, but the well-digested information of a man who has devoted the whole powers of his mind to a great subject worthy of study, and attempts to communicate within a moderate space some portion of the facts with which his memory is stored. There is, indeed, some danger lest Mr. Stubbs's learning should obscure from careless readers some characteristics of his work which deserve as much notice as the mere extent and grasp of his knowledge; and the best service which a reviewer can render is to direct attention to some of the salient features which give Mr. Stubbs's Constitutional History its peculiar character.

The first merit of this author's writings is that he writes history in a philosophic spirit, which (it may be added) is a totally different thing from performing that very worthless achievement which is called writing a philosophy of history. The essence of philosophical treatment of history lies in calmness of mind and in appreciation of evidence. In both respects Professor Stubbs stands prominent, and in curious contrast with several writers of powers in many respects equal to his own. He has nothing, for example, of the spirit of a controversialist, and hence, though he incidentally confutes a host of errors, never loses sight of the fact that the primary duty of a historian is to narrate history, and not to carry on a running fight with every heretic who may venture to deviate from the narrow path of historical truth. The advantage he gains from this is considerable. He finds it possible to learn something from men who hold on the whole erroneous views, and does not feel himself bound to denounce as fools or criminals persons who, like Mr. Coote, see traces of Roman influence in every line of English law; and, at the same time, he achieves what no controversial writer ever accomplishes. By the mere force of accumulated facts he, so to speak, "crowds out" of his path the ingenious fallacies of specialists and crochet mongers. Not a word is said of which Mr. Coote or Mr. Pearson, or any other believer in Roman or Celtic influence, can complain, but candid students who have weighed Mr. Stubbs's statements will feel convinced, once and for all, that (curious though the fact is) neither Romans nor Britons have exerted any appreciable influence on the growth of early English institutions. His intellectual coolness, combined with his firm hold of the canon that where evidence fails profitable speculation ceases, enables Mr. Stubbs to avoid all tendency to override a favorite theory. It is very instructive to contrast his language, with regard to the "mark-system," with the writings of Sir Henry Maine. Of the latter no one who appreciates originality and genius can speak without profound admiration. No modern writer has shown greater fertility in seizing the general aspects of law and history, or has done more to suggest and expound theoretical solutions for the difficult problems presented by early civilization. But this fertility in devising new theories is occasionally marred by a tendency to carry his speculations beyond the point at which they are supported by facts; and, instructive as are his suggestions with regard to the traces which may be found in England of the "mark-system," it is impossible not to suspect that these traces have, to say the least, been magnified by the force of imagination. Professor Stubbs, with characteristic prudence, fully admits that traces of such a system may be discovered among institutions of the Germans who colonized England, but is inclined to doubt whether the system existed at the time when the colonists passed from Germany to Britain. And he further is careful to propound a doctrine which (when once fully appreciated) cuts at the roots of a whole mass of ingenious speculation and rash dogmatism. "Among the first truths," he writes, "which the historical student, or, indeed, any scientific scholar, learns to recognize, this is per-

* 'The Constitutional History of England, in its Origin and Development. By W. Stubbs, M.A., Regius Professor of Modern History.' Vol. I. New York: Macmillan & Co.

haps the most important, that no theory or principle works in isolation. The most logical conclusions from the truest principle are practically false unless in drawing them allowance is made for the counter-working of other principles equally true in theory, and equally dependent for practical truth on co-ordination with the first. . . . And with respect to primitive society this is especially noteworthy." The truth is that every page of Mr. Stubbs's work is an illustration of these sentences; for a chief result of the study of mediæval history is the perception which the student gains of the fact that in uncivilized, even more than in civilized, states of society a number of different principles, which often are at bottom scarcely inconsistent with each other, exert co-ordinate influence, no one being fully carried out, and, at the same time, none being without a certain real effect on society.

This full perception of the very complex nature of institutions which, like the English constitution, stretch back in their origin into the early ages of barbaric society, has, it may be suspected, produced a second marked feature in Professor Stubbs's work—that is, the very wide and extended view which he takes of his subject. On this point, as on some others, it is well worth while to compare him with Hallam. Neither writer need suffer anything from the comparison. They have each some merits which the other does not possess. Sources of information are open to Professor Stubbs which were unknown to his predecessor, and Professor Stubbs has availed himself to the full of this most legitimate advantage. Hallam, again, wrote with perfect fairness as far as intention went, but his speculations were tinged by political bias; for at the time when he wrote, questions of constitutional history had a far more direct connection with the politics of the day than they can have at present, or will in all likelihood ever have again. From such a bias Professor Stubbs is entirely free, and, what is perhaps more surprising, appears to be scarcely influenced by ecclesiastical sentiment or prejudice. A clergyman might, for example, be expected to show something more than justice to Becket, yet no writer has ever placed the conduct of Henry II. in a fairer point of view, or shown more clearly that in his conflict with the Archbishop the King was attempting to carry out a comprehensive scheme of administrative reform, of which his ecclesiastical legislation formed only a part. On the other hand, Hallam possesses in a far higher degree than the Professor the capacity for dogmatic exposition. Professor Stubbs, in his desire not to conclude too hastily, often fails to come to any conclusion at all, and in his very effort to put every fact of importance before his readers neglects at times the paramount duty of giving due prominence to the more important parts of his subject. There is, moreover, no doubt that Professor Stubbs loses something as regards success in exposition by that wide conception of his subject which forms the main distinction between him and Hallam. Constitutional history, as conceived of by the earlier writer, is, in reality, the account of the gradual transfer of sovereign power from the crown to the nation as represented by Parliament. His theme is the variations in the balance of power between King and Commons. The subject thus considered is a comparatively narrow one, and is contained within very definite limits. The writer who deals with it can omit whole fields of legal, administrative, or social history, and, though Hallam occasionally deviates into topics which have no direct bearing on the balance of power, he himself obviously feels that such deviations are hardly justified by his subject, and on the whole restricts his labors to the narrow province which he had marked out as his own. Professor Stubbs means by a constitutional history something much wider than an account of the struggle for supremacy between Crown and Parliament. His aim is to delineate the growth of institutions. The history of the law courts, of the administration, and of social changes is quite as much part of his subject as is the growth of regal or of Parliamentary power, and it is to be regretted that he should have chosen a title which, according to ordinary ideas, ties him down to a far narrower and far less interesting topic. The width of his subject, no doubt, is really a hindrance in the way of lucid exposition, but on the whole it gives his work a very peculiar character and value. He has already thrown a flood of light on early English institutions. When the book is completed we shall, it may be hoped, possess for the first time a sketch of the great complicated, administrative, ecclesiastical, and political system which goes to make up the English constitution.

"No unbiassed observer who derives pleasure from the welfare of his species can fail to consider the long and uninterruptedly increasing prosperity of England as the most beautiful phenomenon in the history of mankind. . . . In no other region have the benefits that political institutions can confer been diffused over so extended a population, nor have any people so well reconciled the discordant elements of wealth, order, and liberty. . . . The constitution, therefore, of England must be to inquisitive men of all countries an object of superior interest."

The well-known passage of Hallam of which these sentences form part, breathes the spirit of the generation who, believing firmly in the immense importance of political institutions, looked upon the English constitution as the most marvellous creation of political sagacity. The tone of the times has changed. There may be unbiassed observers who yet can conceive of no more beautiful phenomenon than the increasing prosperity of England, and there are inquisitive men on both sides of the Atlantic to whom the English constitution has ceased to be that object of superior interest which it certainly once was to statesmen of all countries. The cause of this change of sentiment would itself be a subject well worth careful enquiry. It is, however, after reading Mr. Stubbs's book a more natural question what is the real character and the true merit of that constitution which to the last generation seemed almost the most beautiful phenomenon in the history of mankind. Professor Stubbs is not a politician, and writes little which has a direct bearing on political questions, yet his work, which appears at first sight to be a mere mass of antiquarian knowledge, goes farther than any book with which we are acquainted to answer the enquiry we have propounded.

Any intelligent student who masters its contents will perceive two great facts, which, obvious as they are, have constantly been overlooked, though unless their bearing is fully understood the true character of the English constitution remains a hopeless enigma. The first fact has reference to what may be termed the form of the constitution, and may be summarily stated in the formula that the English constitution, like all mediæval institutions, has been from the first a mass of fictions. Of the fictitious character of the constitution as it has existed in later ages, every critic has been always aware, but it is often supposed that existing constitutional fictions are wholly or mainly due to the maintenance of ancient forms which have lost the significance they once possessed; and that this is one cause of the huge growth of fictions which obscures the real essence of English political arrangements is of course true, but it is not the whole or the essential cause. Take the institutions existing in England at any period you please, and you still will find the same phenomenon of a want of anything like rigid correspondence between fact and theory. William the Conqueror, for example, was as powerful and despotic a monarch as ever perhaps existed in a European country. The true basis of his rule was force, and nothing but force, yet William was in theory the elected king of the English people. The election was, as far as popular consent went, a farce, yet neither to William nor to his enemies did it probably appear a matter of unimportance. It made him, so to speak, in his own eyes and in those of his subjects, a legitimate monarch. It is again perfectly clear that Henry I. or Henry II. wielded an authority scarcely controlled by anything but by the necessity of keeping up the routine of government, yet neither to themselves nor others did these kings appear despots. To consult their council, to yield, in some respects, to the authority of the church, to keep, or pretend to keep, rights or customs which they had sworn to maintain, no doubt seemed to the kings themselves and to all their contemporaries duties which, though often neglected, were real duties. When you ask (and to have pointed out this is one of Professor Stubbs's great merits) whether such rulers were despots, you, in fact, make an enquiry to which it it is impossible to give an answer in the terms in which it is made. They had practically powers which the most powerful modern monarch does not possess, but the exercise of these powers was, in theory, limited by customs, by formulas, and by habits which had a very vague and uncertain influence, but still could not be set aside. The difficulty of determining the actual limits of the power wielded by the Angevin kings is exactly the same in character as that which meets the enquirer at all stages of English history. He is perplexed by the strange mixture of fiction and fact till he hardly knows which is shadow and which is substance. This element of confusion is not peculiar to English history. It is of the very essence of mediævalism. The duties and rights of lord and vassal, the relation of church and state, the true position of the German emperors—who were in fact German rulers of very limited power, but were in theory the successors and representatives of the Roman Cæsars—are each and all obscured by the intermingling of fact and fiction. The true peculiarity is that the constitution of England, being built up on the foundation of mediæval institutions, retains in its form the character of an age of which the spirit has passed away from the modern world.

The second great fact has reference to the spirit rather than to the form of English institutions, and may be expressed in the assertion that their one essential merit has been to secure the rule of law. Many characteristics constantly ascribed to the English constitution it has never as a matter of history possessed. It never, for example, was really an arrangement for placing the government in the hands of the wisest

or best of the nation. It never, again, until quite recent times, was a system based on anything like complete representation of the people. What we call representative government was, as Mr. Stubbs clearly shows, originally the mere outgrowth of a very complicated scheme of administrative arrangements; nor, further, did the English constitution at any time completely provide for the government by the nation in accordance with the national will. To use such terms as the will of the nation, the rule of the majority, or the influence of public opinion, in reference to the times of the Plantagenets or of the Tudors, is to fall into the worst of anachronisms, and to apply to former ages expressions which so applied are either meaningless or delusive. So far is it from being the case that England has always or generally been ruled in accordance with the national will, that even so late as a century ago the nation had not practically the power to choose by what ministers it would be governed. George III. kept one incompetent premier after another in power when the mass of the people certainly desired to keep Chatham in office. At an earlier period neither king nor commons dreamt that the people of England had any right to determine who should be the servants of the crown. As long, in fact, as enquirers strive to find in the original plan of English government what would now be considered the most essential characteristics of a popular institution, they are certain to fall into error, because they attempt to discover excellences quite foreign to the character of the English constitution.

Students who wish to understand the ground on which it really deserves admiration should take up a book like Mr. Stubbs's history, dismissing all preconceived ideas, look simply at the historical facts of the case, and ask themselves what has been throughout the essential peculiarity of English political development. The one marked characteristic will in such examination be found to be that, through a fortunate combination of circumstances, the rule of law was established in England at a time when it was unknown in every other great country of Europe. This supremacy of law has been the feature which has struck all acute observers of English political life. It was apparent to Comines when he wrote that "among all the world's lordships of which I have knowledge" England is "that where the public weal is best ordered and where least violence reigns over the people." The same feature at a later age struck Voltaire when he took refuge in a land of law and order from the dangers of illegal arrest and arbitrary imprisonment. It is, again, the one salient feature of the rule of the first two Henrys. These kings were in one sense despots, but they built up a great administrative system which established the power of the law throughout every part of their kingdom, and which, harsh and oppressive as it was, by the mere force of rigid routine at once curbed the lawlessness of feudal barons, and to a certain extent checked, if not the power, yet at any rate the arbitrariness, of the crown itself. Mr. Stubbs's present volume, taken together with his admirable collection of charters and documents illustrative of English history, gives the fullest account yet produced of this grand system of administration, which was planned in outline by William the Conqueror, and partly developed by the first and second Henrys. He directs attention to the curious paradox which lies at the basis of English institutions, that the great power of the crown was in a sense the cause of the ultimate freedom of the people. In his pages intelligent readers may see how the power of the king first checked the lawlessness of the nobility, then established a uniform system of law and of direct taxation which still forms the foundation of the English scheme of government and administration, and lastly accustomed the English people to that rule of the severe but always fixed and definite law which is the real glory of English institutions, and which, in ages when arbitrary government was universally established throughout the rest of Europe, made the English constitution, with all its obvious defects, seem the most beautiful phenomenon in the history of mankind to all statesmen and theorists interested in the welfare of the human species.

## THE PRINCE CONSORT.*

IT must be admitted that Mr. Theodore Martin had a difficult task. He was obliged to be fair and at the same time to be flattering—to please his own conscience and yet to please the Queen. Her Majesty, it is known, has established what the French call a *culte* of the memory of her late husband. She has been, throughout Mr. Martin's work, his constantly implied coadjutor; she has furnished the greater part of the material used; and she has, in a measure, prescribed the key in which the performance was to be pitched. Mr. Martin, on the other hand, strikes us as a man of sense and of taste—not a man to enjoy working with his hands tied—tied even with golden cords. He has solved the problem very happily, and succeeded in being courtly without being fulsome. The reader, indeed, forgives an extra genuflexion now and then in view of the cause at issue. All biographers stand pledged to take their heroes very seriously, and it is not always that exaggeration of praise is so venial a sin as in the case of the subject of Mr. Martin's memoir. The Prince Consort was an eminently honorable and amiable man, and in being summoned to admire him we are summoned to admire the great amenities and decencies of life. It is probable that if he had not been elevated by fortune into a position of great dignity, the eyes of the world would never have found themselves very attentively fixed upon him. But his merit and the interest of his life lay precisely in the fact that, without brilliant powers, he contrived to adorn a brilliant position. Fortune offered him a magnificent opportunity to show good taste. The Prince Consort appreciated his chance, availed himself of it to the utmost, and has bequeathed to posterity an image of the discreet prince *par excellence*. We take it that, if he had chosen, he might have done quite otherwise. His marriage was a love-match, and the Queen to the end seems to have been determined it should remain one. Her Majesty admits us into her confidence on this point with a frankness which is worthy to become a classic example of virtuous conjugal fidelity.

Mr. Martin gives an agreeable sketch of Prince Albert's early years, which were apparently passed in no more brilliant fashion than those of any well-born young gentleman with a taste for study. He was handsome, amiable, very well-behaved, and, if anything, a trifle too serious and high-toned. He was not fond of ladies and compliments, and thought they made one waste a great deal of time. From the first he was religious, as became a descendant of the first German prince who had come to the help of Luther. Mr. Martin gives a great many extracts from letters and journals, which, however, rarely offer anything salient enough to quote. The Prince's writing, like that of the Queen, though in a much less degree, is rather pale and cold, and tends to give one the impression that, in royal circles, the standard of wit is not necessarily high. Here are a few lines from one of the Queen's letters, written during a visit to Louis Philippe in 1843: "The people are very respectable-looking and very civil, crying 'Vive la Reine d'Angleterre!' The King is so pleased. The caps of the women are very picturesque, and they also wear colored handkerchiefs and aprons, which looks very pretty. . . . It is the population and not the country which strikes me as so extremely different from England—their faces, dress, manners, everything." Quite the best writing in this first volume of Mr. Martin's is to be found in his numerous quotations from the Baron Stockmar, a personage who has not enjoyed a wide celebrity, but who, without exactly being called one of the occult forces of history, exerted a very large private influence. He was a simple citizen of Coburg, where he practised medicine and became intimate with the Queen's maternal uncle, Prince Leopold, later King of the Belgians. Through him he was made known to the young prince and princess, before their marriage. He occupied no high positions, and though he was charged with an occasional political mission, the part he played was generally that of informal, confidential adviser. He was admirably fitted for it by his extreme integrity and sagacity, and the advice he gave—and which seems to have ranged over the most various points of public and private conduct—was remarkable both for its shrewdness and for its elevation and purity. His relation to the young Prince and to the Queen was one of paternal solicitude, and they apparently showed him in return an almost filial deference. Baron Stockmar seems to have been afraid that the Prince would prove rather too light a weight. "His judgment is in many things beyond his years," he writes in 1839; "but hitherto, at least, he shows not the slightest interest in politics. Even while the most important occurrences are in progress and their issues undecided, he does not care to look into a newspaper; he holds, moreover, all foreign journals in abhorrence." In this respect, later, however, the Prince left nothing to be desired. An active politician he of course was forbidden ever to become; but he was an attentive observer and a conscientious, an even laborious, reasoner. Baron Stockmar's good counsels on his marriage were especially opportune; there is something almost touching in the young man's devout desire to accommodate himself irreproachably to his high position. He was by nature discreet and cautious, and of a temperament, we should imagine, the reverse of nervous, and it probably cost him no great effort to keep himself carefully in hand. The difficulties of his position, however, were not small, and he had to resist encroachments as well as to avoid making them. His dignity had constantly to contend with the imputation, more or less explicit and ironical, as might happen, that he was where he was

* 'The Life of His Royal Highness the Prince Consort. By Theodore Martin.' Volume I. New York: D. Appleton & Co. 1875.

simply that the Queen might have heirs. But whatever there might have been originally of a trifle grotesque and anomalous in his situation, the Prince effectually lived it down, as the phrase is. He never became positively popular, and to the end of the chapter, we believe, the mass of his wife's subjects had their little joke about his imperfect horsemanship and seamanship; but he inspired a great deal of tranquil respect. Mr. Martin, indeed, offers evidence that the Prince was a good rider, and that early in his English career he proved his competency in the hunting field. After that he let the matter alone. He let it too much alone, probably, to please the lusty British public. His tastes lay in another direction, and were of the so-called elegant sort. He preferred the fine arts to the turf, and "encouraged" concerts rather than pigeon-shooting. He remained always a German in character, as he had excellent reason to do, but he played his part of Englishman very creditably. It was a part that had to be learned from the beginning almost, for up to the eve of his marriage he spoke English but poorly.

Mr. Martin's first volume is a record of the domestic life of the royal couple up to the year 1848. He touches a good deal, of course, upon public matters—often to an extent that leads one to charge him with being conscious of a want of lively interest in the Prince's more immediately personal history. The long and detailed chapter on the Spanish Marriages, for instance, strikes one as not being in the least biographical matter. The only relation these events had to the Prince was that during a visit of the Queen to Louis Philippe, in which he accompanied her, the French King had given a verbal assurance that no such projects were entertained. The Prince reformed the royal household, and put it on an economical footing, became Chancellor of the University of Cambridge, proposed to the Duke of Wellington the establishment of "courts of honor" to replace duelling in the army (a proposal which the "Iron Duke," thinking perhaps that it savored of German transcendentalism, received without enthusiasm), bought, with the Queen, the domain of Osborne, and spent much time and thought in planting and decorating it, established and conducted, baton in hand (as we infer) the so-called "antient concerts," set on foot the fresco-painting in the Houses of Parliament (ungrateful memento as this now appears), ordered pictures, composed songs, laid foundation-stones, studied industrial processes, and through all and above all was the most caressed and adored of husbands. Such conjugal felicity as that of the Queen and Prince would be remarkable in any walk of life, and we suppose that in their exalted station it is peculiarly exemplary. The Queen is determined we shall not lose a single detail of it. She chronicles that after her various confinements his "care and devotion were quite beyond expression. No one but himself ever lifted her from her bed to her sofa, and he always helped to wheel her on her bed or her sofa into the next room. For this purpose he would come instantly when sent for from any part of the house; . . . he ever came with a sweet smile on his face. In short, his care of her was that of a mother, nor could there be a kinder, wiser, or more judicious nurse." When he makes visits or receives them she registers with delight the favorable impression he produces, and is immensely gratified at the French compliments paid him by the Emperor Nicholas. Her Majesty's notes on this subject have a quality which bespeak some sympathy for the biographer who is compelled to interweave them with his narrative. The truth is that the Prince Consort was not in any degree, save through his marriage, an eminent man; and without resorting, in the case of this memoir, to the homely adage which restricts the material of which one may attempt to make a silk purse, we may say that even all Mr. Martin's courtly ingenuity and pulling and stretching of his material, quite fail to elevate his subject to heroic proportions. The Prince, like many other gentlemen, was a man of heart and of a good deal of taste of a limited kind, who took life seriously, and cherished an eminently respectable desire to do his duty in that station in which it had pleased Heaven to place him. He was an exemplary husband and father, and a placid dilettante, less in the large way than in the narrow. We suspect that his great modesty and good sense would have been somewhat ruffled by the prospect of being commemorated on the extensive scale of these volumes, which, although they do not reveal to us another unsuspected Marcus Aurelius, confirm our friendly and even tender estimate of him. The whole atmosphere of Mr. Martin's book, to tell the truth, is charged with an oppressive mediocrity. As to this, the book is really a very queer one. We are in the company of very great people; but, bless us, how extremes meet! The work is densely interlarded, as we have said, with notes and communications from the Queen's hand, and her Majesty's touch and accent are really irritating to the nerves, in their flatness and vapidity. The work is worth reading, however, for it provokes one to philosophic reflections. If some of the bad Roman emperors had not descended into the circus, and if Frederic the Great had been less of a scribbler, we would say that nothing could be more characteristically modern than this descent of a British monarch into the circulating-library. As it is, there are touches and oddities about it which make it modern enough. And without wishing to philosophize, many of Mr. Martin's readers will find much remuneration. The constitution of the human mind as yet is such that there is a great chance for a book which can offer you a bit like this: "Victoria was safely delivered this morning, and though it be a daughter my joy and gratitude are very great. . . . V. and the baby are perfectly well."

---

*Half-hour Lectures on the History and Practice of the Fine and Ornamental Arts.* By William B. Scott. Third Edition. Illustrations by W. J. Linton. (New York: Scribner, Welford & Armstrong.)—It is a popular notion that a painter cannot be a good critic of painting, as though the preference inherent in choosing that branch of art, or a personal interest in the subject, deposed the judgment. The reverse is almost absolutely true, viz., that no one, not a painter, can adequately judge of a picture; and though men properly qualified by practice and study often err in comparative estimates of art, especially when they themselves enter upon it, it will be found that the mistake lies generally in overestimating themselves and their work rather than in underestimating their rivals.

Mr. Scott, whose reputation as an artist is above that of the average of English painters, is a good argument against the popular fallacy alluded to, and a still more striking illustration of *ne sutor ultra crepidam.* So long as the author adheres to his "history and practice" he does well; his studies have been wide, his collation is concise, and his book of great interest and value, though in style far from what a third edition should have made it. When, however, he attempts philosophizing on art he is *ultra crepidam.* He has the common tendency of writers who cannot generalize to suppose that everything must begin with some general statement, which is certain in the main to be incorrect. He opens this book with the following:

"Whatever touches us most deeply in the forms or motives of art dates no further back than that epoch in the history of the world when the great and wonderful change began from paganism to Christianity, from philosophy to revelation, from sensuous refinement to moral self-abnegation. When we pass beyond our own era, we enter an atmosphere foreign to modern vital principles; we cannot live in it—we may only indulge in it; it affects us intellectually, not feelingly. The fundamental ideas of the ancient artists are not ours, their habits have no interest to us; we cannot help thinking of them as having lived abstractively from sympathies and passions, cold and deaf to human cares and enjoyments."

In this passage the author has put as many errors as assertions. *As art,* nothing touches the highly-cultivated taste so deeply as the remains of Greek sculpture, and it is sufficient to quote this opening sentence to show that the writer's perceptions of art are hopelessly mixed up with some of those associated elements of sentiment and ecclesiasticism which have for the most part clouded the sky of modern art. For the rest, it would be curious if Mr. Scott could show that any such great and wonderful change has yet taken place in the world at large, or that modern society has been distinguished less for "sensuous refinement" and more for "moral self-abnegation" than that in which Socrates and Plato lived. Mr. Scott lives, we believe, in London, and can collect materials for a judgment without much trouble. As for his expression, "When we pass beyond our own era, etc.," it is hard to know what it means. It is a logical, analogical, and symbolical muddle, from which we may extract the possible meaning that we should not have been happy if we had lived with our present views and habits in the times anterior to the Christian era; which, as a generalization, is another absurdity, because there are undoubtedly large sections of the earth's surface where life is passed very much after the antique manner, and where many English travellers seem to be willing to accept the conditions of existence. If it means that we have no place in the thought of antiquity, it is equally untrue, for the thought of the ancients is part of our every-day education, and their art the basis of all our art. "The fundamental ideas of the ancient artists are not ours, etc.," is exactly controverted by what the author says on another page, that "beauty is the inspiration" of genius, for beauty in some of its forms has ever been, as it is now, the "fundamental idea" of all pure art; and the higher the education of the student of art rises, the more clearly does he perceive that Greek art contains for form, as that of Venice does for color, the essential or "fundamental" ideas of all subsequent genuine work. The author seems to have fallen into the superficial notion so common with a certain class of German critics, that human nature in B.C. 900 was in some incomprehensible way different from that of A.D. 1870, and that because Greek artists are known to us only by stone they must have been stone, intellectually and morally, "hav-

ing lived abstractively from sympathies and passions, cold and deaf to human cares and enjoyments."

In fact, the moment our author ceases to deal with ascertainable data of practice or history, he becomes unreliable ; and when he ventures into speculation or metaphysics he encumbers his book with unprofitable rubbish. Thus he tells us that Marc-Antonio was inferior to the German contemporary engravers, and adds : "Indeed, his copying thirty of Dürer's woodcut prints of the Passion of Christ . . . is an acknowledgment of his own inferiority in design at least"—as if that had anything to do with his inferiority, or the reverse, to his rivals the German *engravers*. Of Hogarth he remarks : "It is his invention, his inflexible tragic and satiric feeling, repulsive and gross as it is, that places him in the *first rank of art*"—the fact being that while Hogarth's "tragic and satiric feeling" places him in the first rank of satirists, he never was in the first rank of art. Finally, not to multiply instances, he speaks of lithography (p. 181) as "properly called chemical printing, in distinction from other methods which are purely mechanical," whereas there is no such distinction in the case, the term "chemical printing" being as inapplicable to lithography as to etching.

# Fine Arts.

## THE WATER-COLOR SOCIETY'S EXHIBITION.

III.

WATER-COLOR offers peculiar temptations to artists to introduce a style of figures into landscape which are a little more important than those usual in oil-color scenery, and which interrupt the out-of-door sentiment while by no means satisfying the closer study accorded to legitimate figure-groups. Of this class, the large parade of children in the autumnal woods (263), by Mr. Bellows, is an instance. This rather unlucky family of girls destroy the privacy of the woods, yet are not in the least interesting as child-characters. Birket Foster has introduced much of this perfunctory figure-furniture, trailing off from the saliencies of his landscapes in such a way as to build out the lines of the composition; and all the cartoon painters seem to think that the trick may be imputed to them for righteousness. Singularly enough, these groups of figures, unable to lie quiet in the corners and not fit for exhibition in the focus—the hobbledehoyhood between figure-painting and landscape-painting—are always groups of hobbledehoys. Great girls, with awkward hands and peasant sun-bonnets, and boys of terrible vacuousness, intrude into the picture with the self-dissatisfaction and unsatisfactoriness of their class. After these upholstery-figures, there is immense relish in the most capricious sketches of Mr. Homer, in the vaguest gossips or sea-side loungers of Mr. Bush, or even in the styleless and illustration-like group of turkey-shooters of Mr. Scott.

Mr. Bellows, in fact, with the other introducers of populating figures in the style of Birket Foster, is a determined architect of compositions. Every landscape he finishes has its allotted centre and periphery, its prominent object and its leading lines, its thread of white ducks or its pair of promenaders in strong relief, and the trick is titillating until you detect it. He paints like no English water-colorist ; yet the routine and stencil-work of the English water-colorist have artistically deadened him. His "Devonshire Cottages" and his "View near Torquay," his Surrey landscape and his elegant little india-ink sketch, are beautiful to the point of being pretty. He works, too, with megilp or other varnishy substance, so that his touches collect like corpuscles or coagulated particles, as a pen will write on a porcelain slate ; this vehicle, which allows him to use any quantity of body-color without losing transparency, has its advantages, and seems to comport well with his way of seeing nature ; but it enhances, for his water-colors, the look of sponginess and deliquescence which even in his oil pictures is sufficiently unsatisfactory.

Mr. James D. Smillie, too, in his pair of large subjects in distemper, introduces figures with a strong intention to make them mean a good deal. The lovers walking abroad in "Autumn" and the playing child watched by her mother in the "Spring," are placed where the eye is instantly clamped down upon them like an iron on a magnet ; they are expressive, and are not too big, but they are not sufficiently studied. The pair of pictures in question, though they have that set purpose of being ornamental we observe in fire-screens, are skilfully treated ; but they do not define their place in art between the sentiment-picture, meant to talk to the heart, and the decorative picture, intended to fill up an architectural space. A very finely pencilled composition by Mr. George H. Smillie, representing the Yo-Semite scenery, is rather unfortunately not open to sale, though it has attracted much artistic attention.

The painter who feels that his best, his sweetest mission is to please, should not, like Mr. J. G. Brown, extinguish a pretty little girl in a Louis XIV. wig. The confusion of epochs is distracting, and the most careful work given to outlining an accidental zigzag shadow on a cheek will not please in the case of a little female dandy with a drawing-room air sailing boats in the rustic horse-trough. Mr. E. L. Henry, who is a very delightful and entertaining and thorough antiquarian, seems not to have the slightest idea of handling water-colors. In his scene with the old yellow cabriolet, the background is sketched with a timidity that positively makes the spectator uncomfortable ; and again, a slip, unusual with Mr. Henry, has made the head of the rider quite disproportionate to that of the footman. Mr. Reinhart shows a good study of two French exquisites at sword-practice, full of alertness and grace, though a slight thing. Mr. W. L. Sheppard has a black voter succumbing to the wiles of a ward politician, designed in a rude and common manner, yet not inartistic, and, we need not say, strong and pat in expression. Vaini, the resident Italian, contributes several studies that are positively hateful for their etiolated rococo folly, their immodest pretentions of effect, looseness of design, and a general valet-like insolence not easy to define more exactly. It is the art of the modern Roman school brought down to the servants' hall.

The study of grapes by Mr. W. J. Linton is perfect for firm, bloomy plumpness, and easily the best fruit-study exhibited. That of the "Clove in the Catskills" is delicate and rather mincing in its movement of water, reminding one of Mr. Ruskin when most deeply impressed and most completely paralyzed by conscientiousness. The flower-studies of Mr. Lambdin have been alluded to before, but we may once again give prominence to his well-balanced campanili of tiger-lilies cut against an excellent sky, and his rose-bush, overrun and borne down by a lushy English ivy—a composition which amounts almost to a drama, and certainly does to a parable. To convey a landscape-feeling along with groups that are substantially still-life groups, has been a pleased object of study with many flower and bird painters, *e.g.* Mr. Lambdin and Miss Bridges—an object revived, we may say, since the studios were flooded by the Japanese patterns, with their statuesque groups of irises or tortoises in front, and the quick dash at an illimitable horizon above ; and no trick of composition so well carries the thoughts out of the sick-room air of the still-life painter's studio, with its varnish-bottles and porcelain saucers, its anxious-looking flowers, grape-bunches, and lemons half-cut through. Our obligation is not small to that nature-loving race which has added a sky-line and an outlook to our ornamental panels and screen-paintings. Collections like the present, with their varied experiments in decorative effect, are much occupied with the relations of object-painting, whether of birds, animals, or nosegays, towards the landscape setting. To paint a plant is well enough ; but to add that supplementary study which sets it with its natural relief against a chosen sky-motive, helps the suggestion and the escape of the mind almost to infinity. The dishevelled sheep and shepherdess of Mr. Magrath are in keen harmony with his rolling moors and blowing sky ; it would be hard to explain just what loss of sentiment or contraction of the perspective makes the sheep-drawings of Brissot mere animal models, and nothing more ; yet the eye instantly seizes the former as a poem, and the latter as an academic exercise. The dogs, by Le Jeune, have the gravity and meditative purpose of dogs, and define a storied epoch before or during the hunt, while they make the recital real by the appropriate solidity with which they stand out in the picture. On the other hand, the lions and tigers of Mr. Wolf have the cruel poison of the Zoölogical ; it would be but another step in art to introduce the arsenic under their hides and promote them to taxidermy ; they are painted with the thinness and flatness of transparencies, and the limner plainly shows the metaphysical English trait—he wastes himself in guesses at what the lion and tiger are thinking about, and in a sort of moral censure of their low, prowling ways, instead of giving his best thoughts to the expression of light, shade, and relief, so as to make the eye believe in the solidity of his forms.

To return to the unadjusted balance or oscillation of figures with landscape in some of these water-colors, there is reality in the forcible aid which Mr. J. D. Smillie's figures, in his "Idle Hours," give to the scenery. This drawing by the society's president shows each element consciously aiding

the other, while the human element is interesting enough, with its little tale of idle summer love, to bear its place in the foreground. If we compare it with the almost insulting presence of Mr. Bellows's great girls precipitated into the whispering woods—with Mr. Bricher's clay-cold pairs inserted at the proper place like statuettes in his avenues—with Prout's view of the Riva dei Schiavoni thronged with lay figures in nightcaps, *obligato* fishermen, causing us to understand in a new sense the flattering remark that Prout paints crowds one wants to get out of the way of—we shall see how much better a little thoughtful figure-work, even in such slight cartoon-drawings, is than the determined rush of vapid supernumeraries, whipped into a scene to give it a human and affable air. It is because the *aquarelle* seems especially taxed with this billeting of meaningless street-crowds or ornamental Birket-Foster groups, that the subject has been dwelt on here.

Mr. Richards, having long since invented the grave coast-scene in monochrome, with waves carefully cut in every facet like a gem, must be struck with the long procession of disciples he has involuntarily created. "Most can raise the flowers now, for all have got the seed." His best example this year is the group of cedars at Atlantic City, with their twisted, athletic limbs and foliage shorn sheer off to a level on the windward side, set on a coast all variegated with the ribbed patterns of drifting sand and the *moire* of pools left by the tide. Of his obvious imitators, Mr. Bricher, in his large Halifax scene, gives the more obvious qualities of the original, but there is a striking difference—in the unfeeling writing-master's flourishes in body-color with which the curl of the breaker and the high lights on the rock are defined. In Mr. Richards's marines every touch has the expression of soul. It seems to be hardly so, however, with the same artist's touch for foliage; more than once, as in the foreground trees of 298 and 174, he shows a new, blotted style that has neither generalization nor definition. Mr. Nicoll's late efforts in landscape or marine exhibit a peculiar sponged-out appearance, not referable to any effect we recollect in nature; the landscapes, covered with a sort of yellowish mucus that obliterates all articulation, are sickly-looking and uninviting; the sea-studies are often like views into a dirty aquarium; and where a strong effort is made to express the violence of strong spray, the motion is rather turbulent than imposing. The windiest air and the wildest foam act according to laws, and it is a better thing to try and express those laws, however imperfectly, than to express the confusion of mind which one is apt to feel in looking at such phenomena; a little more attention, and optical analysis will convince an artist that a riot of dashing spray looks otherwise than powder beaten out of a peruke, and that it expresses its wildness by rules which are the central part of the emotion it inspires.

The collection, in substantially its old form, will be opened for exhibition in Brooklyn next week, the sold pictures being replaced by others; and the continuation of the exhibition over so long a period between the two cities gives us opportunity for this extension of a notice now partly retrospective.

## *The Reader.*

MORRIS'S 'ENGLISH GRAMMAR,' FOR THE SERIES OF LITERATURE PRIMERS.—ELLIS'S 'LATIN PRONUNCIATION.'—LATIN GRAMMAR, READER, AND PROSE COMPOSITION, BY ALLEN, NUNNS, AND BELCHER.—WATSON'S 'LETTERS OF CICERO.'

Among the happy privileges prepared for the rising generation of students, that of learning from text-books composed in a philosophical method, and not an arbitrary method, is perhaps the most welcome; for the young are natural logicians, and instinctively resent being dragooned into science. In the 'Primer of English Grammar' just written by Dr. Richard Morris, President of the British Philological Society, and condensed into about a hundred pages of plain instruction, we find this advantage fully shown. The learner is made from the beginning to feel an interest in the historical aspect of our grammar; to appreciate those roots which, as they are the oldest, are the most vital and the strongest; and, while admiring the "sabre-cuts of Saxon Speech" which give incisiveness to all our best models of style, to recognize secondarily the graces and variations which came in with the intercourse which English history developed with the southern nations of Europe. Of Dr. Morris's little grammar in general, it should be noted that, apart from this progressive method which gives it some of the interest of a history, it has the clearest definitions, the most radical analysis of English syntax, and the most happily chosen models, ever pressed into the service of this branch of study. The wonder is how so much can be taught in a mere pamphlet.

This volume opens a series of "Literature Primers," prepared with the utmost skill of condensation, under the general editorship of J. R. Green, M.A., the author of an English history which has risen into a sudden prominence on account of its peculiarity of dealing rather with the progress of thought and culture in Britain than with mere politics. Mr. Green is attached to that method of Evolution which is the true method of studying all our history and all our science; the series of Primers will probably all recognize this evolutionary system, and will include an example of historical teaching from the pen of the editor himself. The compact force with which the various subjects will be presented will be found to depend in part upon that historic and progressive method which links all learning together as the development of the human mind. The Primers will soon be published in America by Macmillan & Co.

A cluster of Latin text-books, recently issued by this firm, is of extraordinary interest, because of the radical change in pronunciation and spelling now taught by the best English masters of the Latin language. The world-compelling tongue which has so long been the mainstay of international communication has been shorn of some part of its effect in our English education, on account of an arbitrary habit of pronunciation. Nothing is more certain than that this untenable habit, defended as it is by the prejudice of many generations, will have to yield to a more philosophical one. It seems strange at first to have *cujus* and *major* spelt with *i* instead of *j*, and so pronounced, and the *æ* and *œ* separated. The slow school may wince, as they do at the prevailing change of names of deities into the Greek forms instead of their Latinized translations; and many lovers of literature and poetry may declare, with a brilliant critic of the present day, that they are not willing to go through the thorny wilderness of change in order that their children may enter upon a philological Canaan; but it is as sure that the more philosophical method will obtain the suffrage of the future as it is that a nearer approach is thus made to the speech of the ancients. Our successors will become familiar with *maior*, *caius*, *Caesar*, and *Romae*, just as in course of time the deities of Pope's Homer will have the unfamiliar names, and not those of Swinburne's poems and Browning's new version of Aristophanes.

The little essay on the Quantitative Pronunciation of Latin, for the use of classical teachers, by Mr. Alexander J. Ellis, is a strangely enthusiastic performance, bearing on this change of habit, and tracing it to its depths. "The real trouble of the new pronunciation begins," he insists, "just where no trouble is suspected—in accent and quantity"; and he proceeds, with immense pains and the most original methods of copying oratorical expression, with study of all the pronunciation of the South, and with hints derived from Lucien Bonaparte, to teach the prosody of the Augustan age.

The Elementary Latin Grammar of John Barrow Allen, M.A., of New College, Oxford, is a short and admirable treatise, with some useful departure from former grammars in its analysis of the perfect tense, and with dependence on a multitude of classified examples rather than on repeated rules.

A 'First Latin Reader,' by Rev. T. J. Nunns, M.A., and 'Short Exercises in Latin Prose Composition,' by Rev. Mr. Belcher, are books resulting from wide educational experience and the study of many models, and prepare the student for composition and the enjoyment of the most delightful writers.

As an exercise and a literary pleasure, the selection from Cicero's Epistles, by Mr. Albert Watson, is a judicious presentment. These choice examples of a fascinating *causerie* include some of the great Roman's advices to his brother Quintus, the pro-prætor of Asia, and his correspondence with Atticus, to which we especially refer as a mirror of Cicero's own character, with its mixture of wisdom and foible.

Messrs. Watson, Allen, and Nunns's manuals belong to the Clarendon Press Series.

A New Series of

## *History and Literature Primers,*

EDITED BY J. R. GREEN, M.A.,

Author of 'A Short History of the English People.'

*ENGLISH GRAMMAR.* By the Rev. R. Morris, LL.D. 18mo, cloth, 40 cents; paper cover, 30 cents. [This day.

The following will shortly be published:

*HISTORY:*

EUROPEAN HISTORY. By Edward A. Freeman, D.C.L., LL.D.

GREEK HISTORY. By C. A. Fyffe, M.A., Fellow and late Tutor of University College, Oxford.

ROMAN HISTORY. By the Rev. M. Creighton, M.A., Fellow and Tutor of Merton College, Oxford.

ENGLISH HISTORY. By J. R. Green, M.A., author of 'A Short History of the English People.'

FRENCH HISTORY. By Charlotte M. Yonge, Author of 'The Heir of Redclyffe,' etc.

GEOGRAPHY. By George Grove, Esq.

THE BIBLE. By George Grove, Esq.

Others will follow.

### NEW BOOKS.

*EGYPTIAN SEPULCHRES AND* Syrian Shrines. Including a visit to Palmyra. By Emily A. Beaufort (Viscountess Strangford), author of 'The Eastern Shores of the Adriatic.' New edition, crown 8vo, $2 50. [This day.

*LAOCOÖN:* Translated from the Text of Lessing. With Preface and Notes by the Rt. Hon. Sir R. J. Phillimore, D.C.L. With Woodburytype Illustrations. 8vo, $4.

*L. VON RANKE'S HISTORY OF* England, principally in the Seventeenth Century. Translated from the German. 6 vols. 8vo, $24.

Professor Ranke has long been known as a most laborious and enlightened historian, and the special study which he has devoted to the history of England has borne fruit in the present most valuable work. As the title implies, the kernel of the book is a careful record and examination of the stirring events and changes by which the seventeenth century was marked in England, but the author has given us more than a history of this period, for he has prefixed to it a most interesting and luminous sketch of the earlier part of our history, presented in the form of studies of its most important epochs, and at the end has added a series of appendices comprising critical discussions on the chief contemporary writers of the period, and also by a mass of original documents, for the most part published now for the first time. The English version has been supplied by a body of translators, whose knowledge and appreciation of the work have ensured the production of a spirited and accurate translation.

*SHORT EXERCISES IN LATIN* Prose Composition, and Examination Papers in Latin Grammar. With a chapter on the Analysis of Sentences. By the Rev. H. Belcher, M.A., Assistant Master in King's College School, London. 18mo, 75 cts.

### NEW BOOKS.

*A SHORT HISTORY OF THE* English People. By J. R. Green, M.A., Examiner in the School of Modern History at Oxford. With Genealogical and Chronological Tables, and Colored Maps. Crown 8vo, $2.

"To say that Mr. Green's book is better than those which preceded it would be to convey a very inadequate impression of its merits. It stands alone as the one general history of the country for the sake of which all others, if young and old are wise, will be speedily and surely set aside.' —*Mr. S. R. Gardiner in the Academy.*

*SOCIAL LIFE IN GREECE.* From Homer to Menander. By the Rev. J. P. Mahaffy, M.A., Fellow of Trinity College, Dublin. Crown 8vo, $1 50.

"Mr. Mahaffy has in this little book given us the results of considerable reading, and has given them in a form which is both pleasant and interesting. . . . No omission greatly detracts from the merits of a book so fresh in its thought and so independent in its criticism."—*Athenæum.*

*SIR JOHN LUBBOCK ON*

*BRITISH WILD FLOWERS,* considered in Relation to Insects. With numerous beautiful illustrations. Crown 8vo, $1 50. ('Nature Series.')

*SCANDINAVIAN HISTORY.* By E. C. Otté. With Maps. Globe 8vo, $2 50.

*THE THREE DEVILS,* Luther's, Milton's, Goethe's. With other Essays. By David Masson, LL.D., Professor of English Literature and Rhetoric in the University of Edinburgh. Crown 8vo, $1 75.

*A RAMBLE ROUND THE* World. By M. le Baron de Hübner, formerly Ambassador and Minister, and author of 'Sixte Quint.' Translated from the French by Lady Herbert. 12mo, cloth extra, $2 50.

*CHRIST AND OTHER MASTERS.* A Historical Enquiry into the Chief Parallelisms and Contrasts between Christianity and the Religious Systems of the Ancient World. By the late Ven. Archdeacon Hardwick. Edited, with Memoir, by the Rev. F. Procter, M.A. New and Cheaper Edition, in one volume crown 8vo, $3.

*THE METHODS OF ETHICS.* By Henry Sidgwick, M.A., late Fellow of Trinity College, Cambridge. 8vo, $4.

*SELECTIONS FROM BERKE-* ley. With Introduction and Notes for the use of Students in the Universities. By Professor Fraser, LL.D., etc., Edinburgh. $3.

*PRACTICAL HINTS ON THE* Quantitative Pronunciation of Latin, for the use of Classical Teachers and Linguists. By A. J. Ellis, B.A., F.R.S. Extra fcp. 8vo, $1 75.

# The Nation.

*NEW YORK, THURSDAY, MARCH 11, 1875.*

## The Week.

CONGRESS adjourned on the 4th without passing the Force Bill, and the Tax Bill just escaped defeat. The appropriation bills all got through, as did the Mississippi Jetty Bill, and the bill to admit Colorado. New Mexico is still a Territory. The end of the session was not marked by the usual turbulence, though there was a good deal of confusion, and the proceedings in the House terminated in a very dignified and manly speech delivered by Mr. Blaine, on his retiring from the Speaker's chair. Mr. Blaine has undoubtedly "come out very strong" from the session, and for his ability displayed in managing the House during the filibustering of the Democrats, as well as his integrity and skill, has won a great deal of praise from his own party, from the Democrats, and from the press. His rise to a position of prominence among the leading men of his party is a gratifying sign, for he has obtained his honors not by unscrupulous partisanship, but by hard work in a difficult office, and has increased his popularity not by buncombe speeches, or the low arts of a demagogue, but by the exhibition of those qualities of firmness, good sense, and respect for the rights of others which ought to make a man popular. He has his faults, no doubt, but, compared with Morton, Logan, and the present leaders of the Republicans, he seems like an ancient Roman for virtue. In the next House he will be the leader of the Opposition, and it must be a source of consolation to every one who takes any pride in his country to reflect on the change this will effect. On the adjournment of Congress the new Senate convened in executive session, and Mr. Morton has been trying to get it to recognize Pinchback again. Besides this, the Hawaiian Treaty will demand action.

Mr. Henry Wilson, who has always been a good friend to the soldier in Congress, has tried at various times since the war ended to remedy the injustice done him in the payment of bounties. The injustice was that the three-years men, who enlisted early in the war and saw most of the hardest service, were promised bounties of $100, which were paid in depreciated paper, and therefore received less for more work than those who succeeded them, and who received $300, besides large local bounties. Ever since the end of the war he has been endeavoring to get this injustice remedied by equalizing bounties. Nearly ten years ago, he and other friends of the soldier got a bill passed, under which it is said that some $60,000,000 have been paid out of the Treasury, and which the soldiers generally thought a final measure. This, however, Mr. Wilson never thought enough, and he therefore was very glad to vote for the Equalization Bill of the late Congress, which proposed to remedy the injustice a little more, not exactly by taking $100,000,000 out of the Treasury, for that sum is not there to be taken, but by increasing the debt by that amount—if that was the amount (since no one seems to know exactly how much the bill appropriated)—and to affix his signature to it as President of the Senate. The condition of the bill when he signed it was this: The House had passed the bill, and the Senate had amended it, and the House had voted to non-concur; a conference committee then unanimously agreed to recommend to the two Houses that the House recede from its non-concurrence and agree to the Senate amendments, which the House did; on which, without further action on the part of the Senate, Mr. Wilson signed the bill. The President at once vetoed it, so that the measure is dead. There yet remain, however, two questions with regard to it which do not seem absolutely settled.

The first of these is whether the bill, in the condition we have described, was actually passed, or whether the Senate should have done something more with it. As to this, the Clerk of the House and the Journal Clerk of the House both declare that, in their opinion, the bill was passed, the receding of the House from its non-concurrence placing the two bodies in perfect accord. This seems to relieve Mr. Wilson from all blame as to signing the bill, but it throws no light whatever on the merits of the equalization policy, of which he and Senator Logan are the great expounders. The fatal defect in the scheme for equalizing bounties is that it is an attempt to remedy injustice done by the Government for the benefit of a particular class, though the injustice affected everybody in the country. The soldier who, having been promised $100, received it in depreciated money, was certainly unjustly treated, but so was everybody else who was made, by the Legal-Tender Act, to receive payment of debts in depreciated paper. There are other meritorious classes besides soldiers who have done the Government great benefits both during and since the war, who were paid, not bounties, but their salaries, in depreciated paper. Why should not the pay of all the civil servants of the Government who received their salaries in paper when gold was at 250, be equalized with those who receive the same salaries now with gold at 115? Such men as Mr. Seward and Mr. Adams did the country as much service, at least, as many of the patriots who enlisted in the ranks, yet we have never heard of any movement to have their salaries equalized. Besides this, we may go on equalizing for ever as long as the legal-tender power is kept alive; for if we equalize on the basis of gold at 115 to-day, we may have, before half the money is paid out, to begin all over again with gold at 125, and again at 150. The main object of these bounty bills, of which some half-dozen have been introduced into Congress since the close of the war, has of course been to secure the soldiers' votes, and they account in some degree for the disappearance of that well-known old plank from the party platforms, vowing that the pensions of the soldiers and sailors shall be paid.

Mr. Young Brown's case came up before the adjournment, owing to his desire to get the resolution of censure expunged from the records; but he was unsuccessful. Mr. Dawes said he had looked into the matter carefully, and could see nothing to palliate it. Brown's conduct was utterly black and forbidding. Now, Mr. Dawes must not be so stern a moralist. He must have some bowels of compassion for sinners. It is not every man that can live on his moral plane or on his friend Butler's. Why can't he avert his face and go to Pittsfield on private business when a Brown equivocates or uses bad language? We can tell him this ferocious virtue does more harm than good, because it makes poor fellows who are trying to reform feel hopeless, and drives them back desperate into vice. How would he feel if Brown should take to drink? We believe the truth of the affair is that poor Brown, who is rather a young man, has been studying Burke and Junius, and is very anxious to distinguish himself as an orator; and his invective against Butler was carefully prepared, as he believed, on the best models, and was committed to memory, and he was letting it off anxiously when the Speaker interrupted him; and the "equivocation" which horrified Dawes and roused the moral indignation of the House was simply the result of great mental disturbance on the part of an inexperienced orator. Probably nobody was more astonished than he was himself at its effect, and at seeing Dawes preparing to form a "hollow square" in front of the chair in defence of liberty of speech. As it was, we are informed on good authority, in the confusion Mr. Brown forgot one of his finest passages, which he feels keenly, and which is surely punishment enough in these humane days.

Judge Poland is one of two or three men who left the House at the close of the session with the honors of war—drums beating and colors flying. His triumph in the Arkansas matter was a most gratifying

close to his present term of service, because it was not only complete, but to most people unexpected, as the President lobbied against the adoption of the report of the majority, and as the success of the Desperadoes with the Force Bill seemed to indicate that they could carry anything they pleased. The Judge's course was all the more creditable because he was defeated at the late election. He, however, did not allow this to sour or depress him, but went at his work with renewed energy; had a little colloquy with Butler, in which he truthfully informed that "statesman" that he was a "liar"; pushed his report vigorously when the time came; routed the Carpet-baggers, after a telling speech, the delivery of which is said to have been a very picturesque incident, and which the Arkansas Legislature talk of commemorating by having the old gentleman's portrait painted, to hang in their hall, as he stood in his blue coat and brass buttons, shaking his long finger at the conspirators, and warning them of the wrath to come. Governor Garland has issued a proclamation appointing a day of thanksgiving for the deliverance of the State, and well he may, for seldom has a State escaped a greater danger than that of the seizure of its government by a band of thieves, backed up by the United States.

---

It seems to be admitted on all hands that there are at last unmistakable signs of a revival in business. Even the financial writer in the *Tribune* admits it now unreservedly. But we must point out to him that he described a state of things in the business world last Christmas from which no community could possibly recover in two months, or even get on the fair way to recovery. We are, therefore, driven to the conclusion either that he was mistaken then, or that he is mistaken now; we think the former. We called his attention several times during the winter to the probability that he was indulging in a gloom and despondency for which there was no real foundation in observed facts, and that he was doing much mischief by his wailings, because whatever the state of business, speculation being utterly dead, the evils of the situation were sure to be aggravated by whatever delayed the restoration of confidence. His position is a very important one, and we think whoever fills it ought to have a stronger sense of his responsibilities than the present incumbent seems to possess. If, however, he will now keep up his spirits and desist from crying down honest attempts to set the wheels of industry and enterprise once more in motion, we will look no more into his sad past. Prices are rising with tolerable steadiness on the Stock Exchange; the dry-goods dealers say their spring prospects are good; and there are signs that the prices of produce have reached the lowest point. According to all past experience of the effect of panics, recovery ought to begin now, as we are not far from the beginning of the third year since the last one. No commercial community can go on longer than this working on "short time," and we have no doubt that we should not have gone on so long were it not for the state of the currency and the power of Congress over it—an element of uncertainty which has never had to be encountered in any previous panic in this country. This is now removed, for a long period at least, by the adjournment of Congress, and by the fact that the state of parties in the next Congress will probably prevent all financial legislation. There could hardly be a more striking proof of the separation between the political class and the rest of the community than the fact that honest traders curtail their business when the national legislature is sitting, just as if its members were Mahrattas or Comanches who might any day make a swoop on people's goods.

---

Secretary Bristow has not allowed the public to remain very long in doubt as to the use he intends to make of the money he expects to get from the Tax Bill; for he has issued a call for $30,000,000 of registered bonds to be redeemed on account of the Sinking Fund, or rather—for there is no such fund—to be destroyed in reduction of the national debt. He has chosen registered bonds out of their numbered order, because these bonds are mostly held in the country, and the gold paid for them will therefore, it is supposed, stay in the country, and not, as would probably be the case if he called for others, go to Europe. The question whether he is right in making this selection, and whether he will attain his end in making it, is therefore at present the principal topic of speculation on "the Street." People using gold in their daily transactions and speculations who are "short" of it, applaud his action, and look for an easy spring and summer in the money market in consequence of the disbursement of so large an amount of gold, while large holders of the bonds as investors are grumbling over his calling them out of their order. Others again doubt whether the bonds will not be paid for when the time comes in the new five per cents. The general result, however, seems to be increased confidence in business circles. Two things seem certain, and they are things of vast importance—first, Mr. Bristow is evidently a man who will obey the law, and not wilfully violate it out of his own head; and, secondly, he believes in specie payments, or, in other words, sees the overwhelming importance of the currency question. He is accumulating gold heavily, and has now about $50,000,000; but if it goes out in this way for the redemption of bonds, of course this accumulation has no bearing on resumption. The volume of legal-tenders has been reduced during the week by $1,385,000, being eighty per cent. of the new bank-bills issued under the currency act of the first session of the late Congress.

---

The *Evening Post* was not satisfied with our view of the conditions of municipal reform a week or two ago, and says it has a "practicable theory which is very different from the *Nation's*, but which would promote the end that journal has in view," viz., "Let the property-owners, the substantial classes of society, interest themselves actively and constantly in municipal affairs, and the evils incident to the rule of municipal corporations by majorities will speedily disappear." Now, there are people who will receive this "practicable theory" with unseemly merriment; but we shall not treat it lightly. We only say that, if the *Evening Post* has known of this plan for some time, and has not revealed it, it has been guilty of a great wrong against the people of this city. If, on the other hand, it has revealed it, and "the property-owners and substantial classes" have paid no attention to the plan, what is the value of it? The painful truth is that our venerable contemporary has been sleeping over municipal affairs, and is apparently not aware that this "theory" it produces is about thirty years old, and that its worthlessness, after many trials, is really at this moment one of the symptoms of the municipal disease. No "property owner or substantial man" can give active and constant attention to municipal affairs under the rule of the majority without neglecting all his other business, and sooner than do this he will submit to heavy taxation or move away; and this is what he is now doing in New York, because, as he justly remarks, the object of municipal government is not to take all his time in attending to it, but to leave him his time for the conduct of his business. A municipal government which fully occupied the men of property and affairs, would hardly be any better than a government which compelled every citizen to protect his life and property at his own expense and with his own hand. The old catchword about "rich men attending to their political duties" is now so stale and foolish, that it ought not to be seriously produced in the discussion of city affairs any longer.

---

It will be remembered that in November, 1873, we gave a summary of a pamphlet purporting to contain a history of the Emma-Mine fraud by Mr. S. T. Paffard, of London, one of the stockholders. This, as might be imagined, was very disagreeable to Mr. Trenor W. Park and his confederates, and Park thereupon wrote or caused to be written some letters to one of his Vermont organs, giving that pleasing version of the affair to which he has since more than once treated the public, and speaking of Mr. Paffard in very insulting terms as "that man Paffard—a person of no character." The English *Mining Journal* was so very imprudent as to copy these letters,

and was thereupon promptly sued in the Court of Exchequer by Mr. Paffard, and the case came on for trial on the 17th ult. before the Lord Chief-Baron. The defendant offered a complete and full retraction and apology, and paid $500 into court as a "solatium," which Mr. Paffard accepted as full satisfaction. This will be a warning to English papers against copying Park's statements, and we trust will be a warning to the Vermont organs against allowing him or his friends to use their columns in defence of his mining ventures.

---

A question of parliamentary law of some interest has been raised in England by Mitchel's case, owing to the doubt in which even the lawyers find themselves whether his sentence had really been carried out by the lapse of the time for which he was banished and by his absence from the kingdom during the whole period. If not, why was he not subjected to all the other incidental disabilities of the position as well as unfitness to serve in Parliament? The discussion in the House of Commons was by no means satisfactory on these points, as was shown by the fact that over one hundred members voted against Mr. Disraeli's motion for the issue of a new writ, although most of them at least were opposed on general grounds to Mitchel's admission. As matters stand, however, the chances are that the House will be brought into very disagreeable collision with the courts of law, and in contests of this sort it is apt to get the worst of it; for, if Mitchel is again put up, somebody will probably oppose him, be beaten, and petition against his return, and then, on the trial of the petition before the Irish Court of Common Pleas, the question of qualification will come up, and the decision of the House of Commons be very possibly overruled.

---

Dr. Kenealy has published in his paper, the *Englishman*, an account of himself, and of the work cut out for him in the House of Commons, which is inexpressibly ludicrous, and makes it difficult to avoid the conclusion that his mind is unsound. He represents himself as by far the ablest lawyer and finest gentleman at the English bar, and on the eve of extraordinary professional success when his enemies, owing to his enlistment in the Tichborne case, having tried to kill him with presents of poisoned game, determined to get him disbarred. But this which seemed likely to prove his ruin was simply the means, under God, of causing him to found "The Magna Charta Association" and putting him in Parliament, where "he is going to destroy the Whig and Tory conspiracy against the people"; and being "a mighty army in himself, will carry all before him in Parliament, like Mirabeau in France and Chatham in England." As he "tamed the three judges in Westminster Hall, and kept them down like three cats that hardly dared to mew in his presence, so he will master the Right Honorable Humbugs who delude the people and pass the wicked laws under which they groan."

---

Garibaldi's appearance in Rome as a Deputy has been the occasion of many surprises. In his journey thither he caused dismay among the Radicals by giving them the cold shoulder when they sought to take him under their wing, and his public addresses since his arrival have been characterized by a studious moderation. He has urged the workingmen to bring up their children to the craft of the father, and both by his words and by his example has encouraged their turning their attention away from the distraction of politics and towards the cultivation of habits of industry and thrift. His own special work is to combat the third greatest enemy (after the Papacy and the foreigner) of the Agro Romano, and he is engrossed night and day with plans for diverting the Tiber from its present bed, preventing inundations, and contriving the drainage of the Campagna, in connection with the building up of a new commercial port at the mouth of the river. To this end he has been in active conference with Count Alexander Torlonia, famous for his successful enterprises in reclaiming marshy districts, with Sella and the Government engineers, and even with Victor Emanuel himself, with whom he had an interview marked by manifestations of mutual respect. He has elsewhere spoken quite loyally of the King—another wonderment for the Radicals, who had, it must be admitted, reason to expect something different on account of the ungracious tone of his letter declining the national bounty which had been voted him. Moreover, he allows that the Papacy has had its uses, though it has in his opinion outlived them. Perhaps, if the truth were known, official relations apart, there would be found to exist a perfect tolerance between the King, Pius IX., and the red-shirted Deputy, in all of whom the Italian sentiment is so strong. The Pope, indeed, not the least Italian of the three, is said to have waggishly remarked, apropos of Garibaldi's arrival, "We were two, and now we are three."

---

Marshal MacMahon almost succeeded on Monday in forming a ministry strong politically on every side except the Radical, and, in the matter of ability, strong on every side. M. Buffet, the Vice-President of the Council, has long presided with marked ability in the Assembly; the Duc Decazes has made an excellent reputation already in the management of foreign affairs at a very trying time; and M. Léon Say, the Minister of Finance, is known all over the world as an economist of uncommon power and attainments. General de Cissey, too, could hardly be improved upon for the War Department; and the Marquis de Montaignac, of the Navy, is perhaps as good a model for either soldier or sailor as can be found in France. Mr. Buffet's refusal, at the last moment, defeated this most promising combination. There is no denying that the complexion of the proposed cabinet was strongly Orleanist; and it will strengthen the growing suspicion that the first president of the impending republic will be the Duc d'Aumale, who will again be regarded as a stop-gap, inasmuch as the Royalists will think him too much of a prince to be regarded as simply an executive officer, and the Republicans will look on him as too much of a president to be altogether a representative of royalty; and so the definitive settlement of the question of the form of the government would seem under him still further postponed. The Bonapartists, however, still get the worst of it, though they procure a good deal of comfort from small incidents. For instance, Paul de Cassagnac, in his *Pays*, abused savagely General Wimpffen, who commanded at the surrender of Sedan, and, in accordance with the Bonapartist programme, threw on him all the blame of the disaster. Wimpffen sued him, and there was a great trial; but the jury found for the defendant on every point. The Bonapartists consider this a sign of popular disposition to rehabilitate the Emperor's memory, and it will serve pretty well for that purpose; but it is more probably the result of the French delight in finding a scapegoat which was largely instrumental in leading to Bazaine's conviction. They are also cheered by the completion of the Prince Imperial's course of study at the Woolwich Military School, where he has graduated seventh in a class of forty, and stands first in fencing and horsemanship.

---

The conflict between church and state in Prussia is assuming a character of increasing bitterness. A bill is before the Prussian Parliament, providing for lay administration of the property of Catholic parishes, and the Minister of Public Worship was savage enough, in his speech supporting the bill, to say that the necessity for it was proved by the fact that the State Administrator, who has taken possession of the property of the Bishopric of Gnesen, has discovered a series of embezzlements, extending over a year, of which several clergymen were cognizant, and in answer to a challenge from the Ultramontane side, he named them. This incident, however it ends, will perhaps call attention to the fact that enormous amounts of property are handled all over the world by the Catholic clergy, to all intents and purposes secretly and without lay auditing or interference, and this under a code of morals which makes an exposure of anything likely to bring discredit on the church what is technically called a "scandal," and therefore a grievous offence. We make no insinuation against the honesty of this clerical administration when we say that the strain it imposes on human nature is enormous, and would be unendurable were it not for the celibacy of the clergy and the enforced asceticism of their lives.

## THE FORTY-THIRD CONGRESS.

WITH the close of the Forty-third Congress the history of the United States will pass out of the region of the civil war. For the next two years the legislative power will be so divided that new statutes cannot be enacted and existing laws cannot be repealed. The Lower House may indeed thrust upon the Government some aggressive embarrassments, such as refusing appropriations; but the new majority there will come into power with a peculiar, and perhaps unprecedented, sense of responsibility that seems likely to dictate to party management prudence, fairness, and the absence of all irritating party warfare. So far as appearances will warrant prediction, it may be expected confidently that a calm will settle upon the political field, such as the country has not known for thirty years, in which there will be neither changes nor attempts to change existing laws. During this lull we may hope, if not conclude, that the agitated affairs of the South will settle into an abiding, because natural, equilibrium. The Forty-third Congress has been the chief disturbing element of the last two years, and even its inaction has been singularly a cause of active disturbance. In the next two years neither side will have anything to expect from Congress, and Congress will be practically unable to further the schemes of either set of extremists. The political work of the last three Congresses has been little more than a struggle to keep the intelligence and capital of the South from acquiring their natural ascendancy over irresponsible ignorance. With the last Congress the business of national legislation for State political effect has come to an end.

The Forty-third Congress also marks the terminal point in the course of the Republican party. A party may, indeed, come into power at the next Presidential election, retaining the same name, and made up largely of the same material; but nothing short of the extremest folly and wickedness on the part of the Southern people can revive the Republican party as we have all known it. Whatever may be its name, its policy and its leaders will pass away, to be classed respectively with things that are no longer needed, and with men that are no longer trusted. In the meanwhile, the President and Republican majority of the Senate will continue in nominal power; but not to direct the course of the party, nor to continue its policy. They will be mere place-holders, awaiting an impending change; remaining in office, necessarily and properly, after an extraordinary vote of want of confidence, but without power to do more than carry on the most narrow administration of government, under the surveillance of their political opponents in the Lower House. The political dynasty which really began with the election of Speaker Banks has really ended with the exaugural of Speaker Blaine. The contrast between the party in Congress in 1857 and in 1875 is a demonstration of its success and its decline—in the former Congress, a minority, but united and determined, with definite objects and an unmistakable policy before it, represented by the ablest and purest men that constituencies could possibly select, and having behind it the immense moral power of a people who thoroughly approved its action as being really devoted to the welfare of the country. In the last Congress, a large majority, yet weak and vacillating, divided upon every question of public policy, conscious that the political condition of the country depended upon their action, yet not knowing what to do nor where to go, led by a few men whose private characters were tarnished and whose public lives were simply those of unscrupulous politicians, and, at the end, when the country had emphatically pronounced against them, recklessly pushing through the most objectionable measures as the last expedient of party management.

The rise and fall of the Republican party is also clearly attributable to the successive policies which have been pursued in Congress. In the first stage of its existence—its conflict with the slave-power—its policy was characterized by moderation and strict submission to constitutional obligations. Nothing could have been more reasonable than for a people, of whom a majority were opposed to slavery, to leave constitutional rights undisturbed, and limit themselves to restricting the evil to the parts in which it actually existed. In the second stage—the prosecution of the war—Congress acted, for the most part, with all the vigor and decision that any legislature ever evinced; and if its wisdom was often questionable, it still acted with as much discretion as could well be expected from untrained men in a situation which was always serious, and often appalling. To supply, and equip, and animate the army, to leave the administration to the care of the ablest men in the country, to adhere rigidly to the determination of putting down the rebellion, was as judicious a policy as any set of legislators could have adopted. So far, the Congressional policy deserved respect, and certainly the country sustained and confided in the party. But in the third stage of the party—the restoration of civil government and the settlement of the issues of the war—the policy of Congress has been a tissue of blunders, and as nearly as possible an absolute failure. It allowed an untried Executive to do as he pleased, where a lenient yet firm and decided course should have been established at the first, assuring the exhausted and submissive communities of the law and order which they were not then fitted to maintain, and of their ultimate restoration to civil rights. It next resorted, as a political expedient, to military government, after the war was really over, and invited dangers and evils which were averted by the good sense of such soldiers as Canby and Meade. It then entered into the worst phase of its statesmanship—that of bringing the lowest stratum of society, the absolutely ignorant and irresponsible, to the top, and making it the governing class, practically disfranchising all that there was of intelligence and ability, and dividing society into classes by race, with all the evils that must ever be inseparable from such a division. In 1861, the South had no rightful pretext for rebellion, but since the war it has been the policy of Congress to invade our fundamental principle of local self-government, and to permit the destruction of those civil rights on the maintenance of which civilization and constitutional liberty depend. For some time, the good sense of the country was misled by the specious plea of necessity, but at last, when the test of practical results came to be applied, it was seen clearly enough that where the General Government had governed most, there affairs were worst; that where the experiments of Federal interference and negro supremacy had been most thoroughly tried, there they had most signally failed; that where the unfortunate freedman had been most protected, there he was most persecuted; that the welfare of the colored race, like that of all other races, depends upon industry, intelligence, and the orderly condition of society, and not upon the ballot and the irresponsible power of voting ruin upon everybody in the community except ourselves.

The last House of Representatives has also been a complete illustration of the disintegration that has been going on in the political field. The House has repeatedly differed from the Senate, from the President, and from itself. Considered as a unit, its decisions are full of extraordinary inconsistencies. It delayed the Civil-Rights and the Force Bills until the country had pronounced against them, and then voted for them. It repealed the "salary grab" and restored the franking privilege. It exposed and condemned the worst delinquencies of the civil service and did away with what remained of civil-service reform. It voted one day that the Republicans had carried Louisiana in 1872 and that Kellogg was the duly elected governor, and the next that the Democrats had carried the State at the same election and that Sheridan was the rightfully chosen representative-at-large. It stood up with commendable firmness against Colonel Scott's railway grants and the internal-improvement schemes, yet twice voted a gratuity of probably $100,000,000 in the Bounty Bill. Fortunately for it, the country has been spared the evils of its worst blunders, for which we may thank the vetoes of the President, the timid tardiness of the House itself, and the resolute opposition of the minority.

But let it not be supposed that the last House deserved the almost unqualified condemnation that fell upon its immediate predecessors. On the contrary, there has been no House of Representatives in the last ten years so unsoiled by subsidies and jobs and

private acts and personal scandals. At the close of its first session, one of its sagacious members said in effect that it was made up largely of well-meaning men of very moderate abilities and little experience or culture. The action of the House has continued to justify this opinion. In matters which these men understand, like grants and subsidies, they have acted sensibly and honestly; in the more complicated problems of government, they have been out of their depths—one day striking out for the shore and the next drifting out to sea. When analyzed, the responsible majority appears to have been an unorganized throng, not dishonest or reckless, but possessed of neither legislative experience nor knowledge of statesmanship; nominally belonging to one party, but really divided upon every question of a public nature; now guided by the good sense of a few of the older members, and presently misled by the wiles and sophistries of Butler; anxious to achieve something for their party and for the country, and to participate in the growth which generally attends an intelligent deliberative body, yet dazed and rendered helpless by the most complicated and ill-regulated legislative machinery that the world possesses.

## MITCHEL AND KENEALY.

THE election of John Mitchel in Tipperary, and of Dr. Kenealy in Stoke, are two incidents which are somewhat illustrative of what may be called the "transition period" in British politics; and what they illustrate is the purely sentimental view which the new voters seem disposed to take of the ballot both in England and Ireland, or, in other words, of their readiness to use it simply as a mode of expressing feeling, and without any reference whatever to policy or expediency. In Ireland, the voters have undergone, beyond all question, a pretty thorough process of secularization within the last twenty years. The influence of the Catholic clergy has declined as the church has been emancipated, and as foreign, and especially American, influence on manners and ideas has made itself more distinctly felt. The Fenian movement, which had its origin on this side of the water, never received any countenance from the priests, and it is safe to say that neither does the Home-rule movement. The more astute ecclesiastical politicians see clearly enough the advantages of a strong Protestant government, which, while ensuring security and tranquillity, furnishes the church with somebody to inveigh against, and which prepares "insidious wiles" and "snares" against which the clergy have to guard their flocks. The severance of the English connection, even to the extent contemplated by the Home-rulers, would deprive Cardinal Cullen of the character of a champion, to which he now owes a considerable portion of his influence, if not of his authority, in native eyes. Moreover, the Fenian movement made it pretty clear that if Irish independence were now achieved, the Parliament in College Green would by no means be controlled, as it probably would have been under similar circumstances forty years ago, by the clergy. The priests, if they had any influence at all on the elections or on legislation, would have to share it with a large body of American citizens, who would promptly return to the land of their birth to show the people how to "run the machine" on the New York or South Carolina model. There would be a good deal of talk about Malachi, and Brien Boru, and Patrick Sarsfield, and Wolfe Tone, but the work would be done under inspiration derived from "Boss" Tweed, "Boss" Shepherd, Niles G. Parker, Peter B. Sweeny, and other statesmen of that description. Gentlemen, in the sense in which the word is used either in the New or the Old World, would be carefully excluded from any share in the administration, through fear of re-establishing "the accursed system of caste." The church might possibly be appeased with large endowments for schools, colleges, or convents, but their value would be greatly lessened by the prevalent insecurity, or by the probable atheism and indifference to the ordinances of religion of the politicians of the new school. In fact, it may be fairly said that the church would not only gain nothing morally by the achievement of Irish independence, but would probably lose a good deal. It is even doubtful whether it has not suffered through the overthrow of the Protestant Establishment, because this did away with an invaluable wrong, for which the transfer of the revenues to "the old religion" would have been the only adequate compensation.

The general result is that the Irish voter is a freer and more obstreperous being than he ever was. He has got over much of his reverence for his clergy, and, the Tenure-of-Land Act having made him pretty independent of his landlord, he is really getting to be very prosperous materially. The last annual report of Dr. Hancock, the statistician, shows that the investments in Ireland in Government funds, joint-stock banks, and deposits in savings-banks, have increased during the past year by over $11,000,000. The total in 1864 was only $274,440,000; it was, at the close of 1874, $346,000,000, calculating the gold pound at five paper dollars. The amount of deposits in the joint-stock banks was in 1864 $75,115,000; it is now just double that amount. The deposits in the savings-banks are now $15,000,000; and other indications of the growth of wealth and of its increasing diffusion are equally favorable. The result is that seriousness has largely gone out of politics, and elections have come to have the character of a huge frolic, which gives the voters an opportunity of doing a little homage to a popular hero or hurling farcical defiance at some popular foe.

The election of Mitchel seems to have been one of these caricatures of popular government which we may now expect to become by no means uncommon. There is nothing in the man's career to win for him the respect of people in any stage of civilization. He talked fiercely of fighting, and never fought. He gave his parole as a prisoner, and broke it by a trick. He made himself here the apologist and ally of slaveholders and the enemy of the Government which had sheltered him. He is now old and feeble, as well as foolish, with nothing about him to strike the imagination in the smallest degree; he was bred a Unitarian, and he is an avowed sceptic. Nevertheless, the Tipperary people went wild over him, illuminated their houses and got drunk in his honor, and apparently, when they voted for him, did not care a straw whether he ever sat or not.

One might set this affair down to the account of Irish excitability if it were not for the election of Kenealy in England at the same time. The sole excuse for sending him to Parliament from a North-of-England borough is, that he was roughly handled by the Lord Chief-Justice at a trial in London, and was disbarred for publishing a scurrilous and libellous paper. But this mode of selecting legislators is hardly more rational than the hereditary mode, and is hardly more defensible than electing a man because he had lost a lawsuit or been burnt out without insurance. Nor is the matter mended by ascribing it to sympathy with the Claimant, because, if the Claimant be not an aristocrat trying to get back into the aristocracy, he is a common impostor, and in neither case has any claim that one can well explain on the sympathy of the workingman. There were signs of this strange inconsequence a year or two ago when Dundee elected a young, unknown man because he had composed a slight *jeu d'esprit* called 'Ginx's Baby,' revealing a certain amount of vague sympathy with the poor, over a jurist and legislator of the highest rank in the person of Mr. Fitzjames Stephen. A vagary of this kind would, perhaps, have been explicable had either of them had any personal connection with the borough, but they were both strangers. The electors, in fact, looking abroad over the United Kingdom for a representative, fixed on the obscure author of a small tale as the fittest man for their purpose, which would be somewhat like sending Mr. Bret Harte to the Senate from Maine for writing the 'Heathen Chinee' in California, though the author of 'Ginx's Baby' can make no pretence to Mr. Harte's literary standing.

As the working-class voters get into the way of using their newly acquired political powers under the guidance of their own feelings and impulses, we may expect an increasing number of such additions as Mitchel and Kenealy to the House of Commons. Men of strange fortunes and odd claims on popular sympathy will make their way into Parliament through some such incident or peculiarity as would catch for them the attention or applause of a crowd in the streets; and this will probably last until popular or working-

class constituencies begin to have a positive policy of their own, or, in other words, until they earnestly seek certain kinds of legislation, which thus far they do not, and their affairs are taken in charge by caucuses, or managers. At present, they are barely beginning to enjoy the power of electing and the consciousness of being represented. Before long, they will probably desire to impress their views on the policy of the Government, and, when this point is reached, representatives like Mitchel or Kenealy will hardly serve their purpose.

It ought to be said, too, that if the newly made voters abused their power much more than they are likely to do, they would not be so much to blame for it as those reformers who, during the last fifty years, have, both here and in Europe, been working for the extension of the suffrage. In their eagerness to break down privilege they preached the "natural right" theory of the franchise so forcibly as to dissociate in the popular mind the exercise of it from all responsibility. They made believe that everybody's title to vote was so strong and absolute that how one voted was nobody's business, and talked of representation as if it was in itself the fountain of all blessings, without regard to its quality. From this absurd doctrine has naturally flowed another still more absurd, that it is desirable that every constituency should reproduce its own morality and intelligence in its member; that if the ignorant and vicious, in short, send ignorant and vicious men to the legislature, nobody has any business to complain—as if a member's character affected nobody but those who elected him, or as if Kenealy's vote could not touch Gladstone, or Bright, or Darwin, or Fawcett, or Dean Stanley. The process by which this conclusion about representation has been reached reminds one of the state of mind of the opponents of capital punishment about convictions. After using for a great many years the difficulty of obtaining convictions as an argument against hanging, they gradually worked themselves into the belief that, the end of prosecution being conviction, if you only succeeded in securing a conviction, the nature or effect of the punishment was of no consequence; and they will accordingly show you with a triumphant air a table of convictions for murder, followed by sentences of imprisonment amounting (in practice) to terms of seven years on the average; and, if you ask what effect this has had on the frequency of man-slaying, will treat the question as impertinent. In like manner, many friends of popular government will inform you joyfully that the Workingman, or the Colored Man, or Woman, is at last "represented," and, if you ask how represented, will tell you that that is no affair of yours—that the voter settles this in his closet with his Maker.

## THE HOPKINS UNIVERSITY.

THE Baltimore *American*, discussing the plan of the Hopkins University in that city, says "the *Nation* suggests to the Board of Trustees a university that would leave Latin, Greek, mathematics, and the elements of natural science out of its curriculum." This is so great a mistake that we are at a loss to understand how it could have been made. The *Nation* has never suggested anything of the kind. The university which the *Nation* has expressed the hope the Trustees would found, is simply a university with such a high standard for admission on all subjects that the professors would be saved the necessity of teaching the rudiments of either Latin, Greek, mathematics, or natural science; or, in other words, that the country would be saved considerable waste of skilled labor. The reason why we have ventured to expect this of the Hopkins Trustees is that they enjoy the all but unprecedented advantage of being left in possession of a very large bequest, with complete liberty, within very wide limits, as to the disposition of it. In other words, they are to found a university with it, but as to the kind of university, they may exercise their discretion. That this is a very exceptional position everybody familiar with the history of American colleges knows. All the older colleges are bound to the State, or to certain religious denominations, by laws or usages or precedents which impose a certain tolerably fixed character either on the subjects taught or on the mode of teaching them, or on both. They have traditions to uphold, or denominational interests to care for, or political prejudices to satisfy. The newer ones, on the other hand, are apt to have incurred a bondage even worse still, in having to carry out the wishes of a founder who, in ninety-nine cases out of a hundred, had only a faint notion of the nature and needs of a university, and in endowing one sought rather to erect a monument to his memory than to found a seat of learning. In so far as he was interested in the curriculum, he probably desired that it should be such as would satisfy some want which he himself felt, or thought he felt, in early life, or should diffuse some social or religious or political crotchet on which his fancy had secretly fed during his years of active exertion, and on the success of which he came to think, in the latter part of his life, that the best interests of the community were dependent. The number of these honorably ambitious but ill-informed and somewhat eccentric testators increases every year, as the country grows in wealth and the habit of giving to public objects gains in strength. The consequence is that we are threatened with the spectacle during the coming century of the greatest waste of money by well-meaning persons the world has perhaps ever seen, in the establishment all over the country of institutions calling themselves "universities" which are either so feebly equipped as rather to hinder than help the cause of education, or so completely committed by their organization to the propagation of certain social or religious theories as to deserve the appellation of mission stations rather than of colleges. We speak advisedly when we say that the cause of the higher education in the United States is really threatened as seriously by unwise donors of funds as by almost anything else. Education is now an art of exceeding delicacy and complexity. To master it, so as to have a trustworthy opinion as to the relative value of studies and as to the best mode of pursuing them, and as to the organization of institutions devoted to the work of instruction, a man needs both learning and experience. The giving him money to employ in his special work, therefore, without leaving him discretion as to the manner in which he shall use it, is to prepare almost certainly for its waste in more than one direction. To make the most of the resources of the country for educational purposes, it is necessary above all things that they should be placed at the disposal of those who have made education a special study, and who are free, as we understand the Hopkins Trustees to be, from any special bias or bond, and are ready or willing to look at the subject from every side. Their liberty, of course, brings with it great responsibility, all the greater for the reasons we have been enumerating.

Now, as to the use which they should make of this liberty, the Baltimore *American* fears that if they found a university of the class sketched by us some weeks ago, "the people of Maryland would be greatly disappointed—there would not be over fifty students," and "there would be a great outcry against the investment of three and a half millions of dollars for the benefit of so small a number." Whether the people of Maryland will be disappointed or not depends on the amount of consideration they give the matter. If they are satisfied that the foundation of such a university as is now talked of is the best use than can be made of the money, they will not be disappointed, and there will be no "outcry" at all. Being an intelligent people, they will on reflection see that the value of a university by no means depends solely on the proportion borne by the number of its students to the amount of its revenues, because, judged in this way—that is, as instruments of direct popular benefit—all the universities in the country might be pronounced failures. The vast mass of the community derives no *direct* benefit from them at all. Harvard, for instance, has an endowment of about $5,000,000, we believe, and the total number of its students is only 1,200, while the population of the State of Massachusetts is 1,500,000, so that, even supposing all the students to come from Massachusetts, which they do not, less than one person in every 1,000 profits by the University. The same story might be told of Yale or any other college. Considered as what are called popular institutions—that is, institutions from which everybody can or does derive some calculable, palpable benefit—the universities of this and every other country are useless, and there ought on this theory to be a prodigious "outcry" against them, and they ought, on the principle of equality, if allowed to exist at all, to be allowed to exist only on condition that they will give a degree at least, or offer an education, to every male citizen of sound mind. But nobody takes this view of them. The poorest and most ignorant hod-carrier would not hold, if asked, that because he cannot go to college there ought to be no colleges. Sensible people in every country acknowledge that a high education can in the nature of things be only obtained by a very small proportion of the population; but that the few who seek it, and can afford to take it, should get it, and should get it of the best quality, they hold to be a public benefit. Now, why a public benefit? The service that Harvard or Yale renders to the community certainly does not lie simply in the fact that it qualifies a thousand young men every year to earn a livelihood. They would earn a livelihood in all probability whether they went to college or not. The vast majority of men earn a livelihood without going to college or thinking of it. Indeed, it is doubted by many persons, and with much show of reason, whe-

ther a man does not earn it all the more readily for not going to college at all; and as regards the work of the world of all kinds, the great bulk of it is done, and well done, by persons who have not received a university education and do not regret it. So that the benefits which the country derives from the universities consist mainly in the refining and elevating influences which they create, in the taste for study and research which they diffuse, in the social and political ideals which they frame and hold up for admiration, in the confidence in the power of knowledge which they indirectly spread among the people, and in the small though steady contributions they make to that reverence for "things not seen" in which the soul of the state may be said to lie, and without which it is nothing better than a factory or an insurance company.

There is nothing novel about the considerations we are here urging. The problem over which university reformers have been laboring in every country during the past forty years has been, how to rid the universities, properly so called, of the care of the feeble, inefficient, and poorly-prepared students, and reserve their teaching for the better fitted, older, and more matured; or, in other words, how, in the interest both of economy and culture, to reserve the highest teaching power of the community for the most promising material. It is exactly forty years since John Stuart Mill wrote a celebrated attack on the English universities, then in a very low condition, in which he laid it down broadly that the end above all for which endowed universities ought to exist was "to keep alive philosophy," leaving "the education of common minds for the common business of life" for the most part to private enterprise. This seemed at the time exacting too much, and it doubtless seems so still; but it is nevertheless true that ever since that period universities of the highest class, both in Europe and in this country, have been working in that direction—striving, that is to say, either to sift the applicants for admission, by imposing increasingly severe tests, and thus presenting to the professors only pupils of the highest grade to work upon; or, at all events, if not repelling the ill-fitted, expending all their strength in furnishing the highest educational advantages to the well-fitted. In the last century, Harvard and Yale were doing just the kind of work that the high schools now do—that is, taking young lads and teaching them the elements of literature. At the present day they are throwing this work as far as possible on the primary schools, and reserving their professors and libraries and apparatus, as far as the state of the country and the conditions of their organization will permit, for those older and advanced students who bring to the work of learning both real ardor and real preparation. A boy has to know more to get into either of them to-day than his grandfather knew when he graduated. Nevertheless, with all the efforts they can make after this true economy of power and resources, there is in both of them a large amount of waste of labor. There are men in both of them, and in various other colleges, much of whose work is almost as much a misuse of energy and time as if they were employed so many hours a day in carrying hods of mortar, simply because they are doing what the masters of primary schools ought to do, and what no man at a university ought to be asked to do. It is a kind of work, too, which, if it have to be done in colleges at all, is already abundantly provided for by endowment. No Maryland youth who desires to learn a little mathematics, get a smattering of classics, and some faint notions of natural science, or even to support himself by manual labor while doing this, will suffer if the Hopkins endowment is used for higher work. The country swarms already with institutions which meet his needs, and in which he can graduate with ease to himself and credit to his State. The Trustees of this one will do him and the State and the whole country most service, therefore, by providing a place to which, after he has got hold of the rudiments at some other college, he can come, if he has the right stuff in him, and pursue to the end the studies for which all universities should really be reserved.

## PROPOSED CHANGES IN INTERNATIONAL LAW.

M. CALVO, author of the latest work in the French language upon international law, has published, in the form of a tract of a little less than one hundred pages, his report to the Institute of International Law at its late session at Geneva. It is entitled 'Examen des trois Règles de Droit international proposées dans le Traité de Washington.'

The tract is much more than the title indicates. It begins with an historic statement of the position of the United States in regard to the neutral powers during the civil war; of the facts relating to the *Alabama* and the other offending vessels; and of the diplomatic correspondence between the United States and Great Britain, down to the appointment of the Joint High Commission in 1871. It then gives a summary of the work of the Commission, with special reference to the Three Rules; and follows this with an abstract of the American and English "Cases," arguments of counsel, opinions of the arbitrators, and debates in Parliament upon the subjects submitted to the Tribunal. The author then takes up the subject of the duties of neutrals and the rights of belligerents as to matters upon which the Three Rules have a bearing. He examines, in historical order, the principal treaties, acts of belligerent and neutral governments, opinions of jurists, and interior legislation of states, for the purpose of showing that the Three Rules introduce no new principle or practice into international law, but simply express and define what was already generally recognized. He considers the establishment of these Rules for the purpose of the decision by the arbitrators, and the agreement to promote their operation in future cases, to have been owing to the fact that they were in some respects called in doubt by England, and might hereafter be by any nation upon whom they might bear unfavorably, and not to the absence of a usual general acceptance of the principles on which they rested. He credits our Government with the intention to secure these principles beyond dispute or cavil hereafter by accepted definitions and solemn agreements to abide by them. He gives a thoroughgoing and unqualified support to the American side of this controversy, except as to the indirect damages, and entirely sustains the construction of the Three Rules adopted by the majority of the Tribunal at Geneva.

The latter part of the tract is devoted to the subject of contraband commerce, blockade, the prohibition of privateers, and the inviolability of the private property of enemy citizens on the high seas. On these points he inclines to the extreme views which have usually been taken by the jurists of the Continent of Europe, not as to what now is but as to what ought to be the law and practice between nations.

The learned author proposes that the Institute of International Law shall recommend the chief powers to establish a mixed commission; that this commission incorporate the new or the not undoubted propositions respecting neutrality into a declaration like that of Paris of 1856, to which all nations shall be invited to give their adherence. He suggests the substance of a form of declaration for the above purpose, in eight articles, of which the following is a sufficient sketch:

Art. I. The principles heretofore applied to private property on land shall hereafter be extended to private property at sea. Privateers shall not be licensed, and ships-of-war shall make no pursuit, search, or capture of any private vessels, neutral or enemy, whatever be the nationality of the owners of the cargo, except in the case of vessels engaged in acts of piracy, or convicted of having violated blockade, or of being loaded with contraband.

Art. II. No vessel bound to a blockaded port, having no contraband goods on board, shall be liable to seizure or capture, unless some commander of a blockading cruiser shall have first given her notice of the blockade by an endorsement on the ship's papers.

Art. III. limits contraband to some twenty articles specified, mostly weapons or ammunition,—"et autres instruments quelconques fabriqués à l'usage de la guerre."

Art. IV. Each nation desiring to maintain neutrality shall give notice to the belligerents within three months after the declaration of war.

Art. V. To entitle a nation to the rights of neutrality, she shall be bound (1) to prohibit all manner of enlistments within her jurisdiction for the military or naval service of either belligerent. (2) Absolutely to prohibit the construction, fitting out, or selling for the account of either belligerent, of any vessel intended to be employed as a ship-of-war, privateer, or transport. (3) To prohibit the manufacture or exportation of contraband goods destined for either belligerent state.

Art. VI. The neutral state shall be held obliged to have sufficient legislation and penal provisions and police force, and shall make a *bonâ-fide* use of the same, with alacrity, to prevent or repress all attempts at the infraction of its duties respecting neutrality by sea or land, by all means in its power.

Art. VII. Any negligence in the performance of the duties announced in the preceding article, resulting in an effect upon the struggle, by impairing or embarrassing the results of operations in which a belligerent is engaged, shall lose the neutral state the benefit of its neutrality, and render it liable to make good in damages any injury its conduct has brought upon a belligerent state or its subjects.

Art. VIII. The neutral state which has strictly and in good faith conformed to its obligations as a neutral, may continue its commercial relations, except as to contraband goods, with all the ports of a belligerent which are not blockaded or invested.

That which will most interest the world is the changes which the report recommends. These changes relate to subjects which have been discussed

so fully for many years that no one can do much more than sum up arguments and considerations with which jurists are familiar. It is purposed to examine these proposed changes in their order.

PRIVATE PROPERTY AT SEA. (ART. I.)

This article proposes that the same principles be hereafter applied to private property at sea, as to capture, which have heretofore been applied to private property on land.

This is an attractive suggestion at first sight, but, on fuller consideration, many difficulties present themselves. First, what are the principles heretofore applied to private property on land? The rules respecting it are far more uncertain and complex, and depend far more on circumstances, than those bearing upon ships and cargoes at sea, as the kinds of property on land and their circumstances are infinitely more various. There are exigencies of battles and campaigns which authorize the destruction of all kinds of property, even the habitations and means of subsistence of man and beast. It is at the discretion of the invading force whether it shall subsist upon the invaded country; and, if it does so, it takes and uses everything it needs, subject to no law but humane considerations for the life and immediate comfort of the inhabitants. Merchandise stored for the purpose of sale would be taken without hesitation if needed. The invaders may take for their own use or destroy any kind of property which, if left untouched, would contribute directly to the military resources of the enemy state. Mere personal effects, works of art, science, or letters, would be spared, if used as such, and not held *in commercio*. (Nothing is captured at sea but merchandise, held *in commercio*, voluntarily embarked as such, *lucri causâ*.) In war on land no such thing is known as prize—that is, the transfer of commercial property or its proceeds, in which the enemy state has an interest, to the treasury of the capturing power, by judicial decisions. Simple booty or loot is sometimes permitted on land in special cases, but never at sea. An invading army may leave desolation behind it to delay the march of the enemy. What reasons or rules applicable to Sherman's march through Georgia and the Carolinas, or Sheridan's through the valley of the Shenandoah, can be transferred and applied to invoiced and insured cargoes, in ships registered and licensed by the enemy state, bound into an enemy port, there to pay duties to the enemy treasury equal perhaps to half their value or more? Besides, seizures of private property on land are made in territory where are the habitations and property of the citizens, where they have always been, and from which they cannot well be removed. Marine captures are made upon the common and neutral territory of the sea, where the property has been voluntarily sent as a commercial enterprise, the risks undertaken for the sake of the profits. The truth is there is so little analogy between marine and land captures that they have always been embraced in different categories and governed by different rules, as they rest upon widely different reasons. Property on land is of every possible character, variety, and degree, from the most sacred to the most common, from the most necessary to the most superfluous, from pure merchandise in the market to the most cherished personal objects. Search for it would involve the entering and searching of habitations, among women and children, the sick and the aged, by detached squads of soldiers, often with little chance for identification or control, where the captors are invaders, and where there is every liability and provocation to bloodshed, violence, and outrage. Private property at sea, subject to capture, is merchandise, selected for the purpose of the venture from the mass of property on land, the subject of insurance, and voluntarily embarked upon the common territory of the sea, solely *lucri causâ*, under regulations of the enemy state, contributing directly to its resources for war by duties and imposts levied at its discretion. It is put on board ships selected for the purpose, in the charge of seafaring men who have voluntarily embarked in the business with full knowledge, for the sake of the pay. The capture need never be attended by fighting; the unarmed merchantmen, if unable to escape, yielding to a necessity foreseen from the beginning by owners, insurers, and crew alike. The whole transaction may be as quiet as a transfer of credits from one belligerent to another on the books of the Barings. The responsible captor is the commissioned commander of a public ship, and all property captured must be taken into port and submitted to judicial investigation and decision, the officers of the captured vessel being always necessary witnesses. It has something of the features of a contention of exchequers under judicial supervision.

No one can satisfactorily examine the questions involved in the proposed articles unless he has a clear view of the one principle on which all belligerent restraint and repression of maritime commerce rest. War is coercion for a purpose. The more that coercion can be brought to bear upon materials and resources, and the less on life and limb, the better. It is within possibility that the isolation of a state from all commerce by blockade and maritime capture, with an army of investiture, may be coercion enough, without much actual fighting on land. The purpose of maritime capture is not to punish, distress, or impoverish individuals, but to cripple the resources of the state. The test of liability to capture is the property's actual or possible contribution to these resources. Maritime capture does not rest upon any of the reasons which govern penal or criminal proceedings. There is nothing in the nature of penalty for offences about it, except of course in special cases of violation of the rules of war. The citizen of an enemy state is not, as such, an offender, or liable to any punishment or penalty, whether he is a combatant or a non-combatant. The motive or the state of mind of the owner of property is no test of its liability to capture, whether he be a citizen of an enemy state, or of a neutral state, or even a loyal subject of the capturing power. The nature and predicament of the property are the test as well in case of contraband as of what is called "enemy property." All private property of a citizen of the enemy state is not "enemy property"; and, on the other hand, the property of a neutral or a friend may be "enemy property" in certain predicaments. It is only such private property as is brought within the category of "enemy property" that is the subject of capture; and that category is determined by certain rules which mainly refer to the actual, possible, or presumed relations of the property to the resources of the enemy state.

Many writers, and some of our best, have spoken of neutral carriers of contraband as offenders, and of the condemnation of their goods as a punishment or penalty for their offence. This is not careful language, and lets in a good deal of error. Neither they, nor even neutral blockade-runners, are offenders against any law, either international or municipal. Neutrals have a legal right to deliver their contraband, or run a blockade, if they can, by peaceful means, and the belligerent has a right to intercept them and convert to his own use the cargo and, in some cases, the vessel. But he cannot treat the neutral persons concerned as offenders, or inflict any kind of penalty on their persons or property for having done or attempted those acts. These enterprises are like lotteries permitted by law, in which a man may lose his venture, but for which he cannot be punished. Even the citizen of an enemy state is not an offender, and must be treated, whether a combatant or non-combatant, as one engaged or involved in a lawful enterprise. The introduction into the discussion of war powers of the phraseology of penal or criminal law, penalties or forfeitures for offences (except in case of violations of laws of war), may lead to mistakes as to the radical principles and reasons governing the subject.

These are by no means all the reasons which might be given in explanation of the present system and as objections to the proposed rule, but they are perhaps enough to show that the subject is one requiring much graver consideration than is often given to it. The question is this: Do humanity and public policy require that the law of nations shall give to all citizens of a State engaged in war passports over the high seas for purely commercial enterprises, guaranteeing the payment of the duties and imports into its treasury, as sinews of war, against all hostile intervention? Especially, whether this is desirable as free institutions increase and citizens are more and more responsible for the acts and attitude of their state? Shall the repression of enemy commerce on the high seas be no longer a legitimate means of coercion in time of war?

CONTRABAND GOODS. (ARTICLES III., V.)

Article III. proposes to limit contraband to some twenty specified articles of military weapons and equipment, "et autres instruments quelconques fabriqués à l'usage de la guerre." As the law of nations now stands, articles in their nature ambiguous, or, as the phrase is, *ancipitis usûs*, may be treated as contraband under certain circumstances. For instance, provisions destined to a besieged town; spars, coal, and steam-machinery bound to a port which is a naval arsenal; or ship's stores bound to a neutral port, not for a market, but to be delivered to the enemy's fleet lying at anchor in such port. The test is their liability to become a direct contribution to the war powers and resources of the enemy. As the rule of contraband is applied only to neutral property, the test of liability to contribute must be more clear, strong, and direct than is needed in case of property of an enemy citizen. All property of an enemy citizen may be said to contribute in some degree to the resources of the state. His property, found on the highway of nations, is liable to capture, except where it is exempted by certain rules dictated by humanity and an enlarged public policy. The property of the neutral, on the contrary, has, *primâ facie*, no relation to the enemy's state, is *primâ facie* exempt, and can be taken only where a strong case is made out against it; and that case is limited to one of direct contribution to the aid of the enemy, not in the way of general resources, but

of specific and immediate military use. Upon this principle, some articles, like swords, muskets, and powder, being mainly of military use, are always contraband, if destined to an enemy's port. Other articles, such as pianofortes, pictures, and marble statues, are never contraband. But the greater part of supposable articles are of a mixed and ambiguous character, yet may, under some circumstances, form a most direct and effective contribution to the relief of the enemy. Hitherto, prize courts have not limited themselves to an inspection of the physical nature of the articles, but have enquired into other facts bearing upon their destination and inevitable contribution to the aid or relief of the enemy. A cargo of steamer's coals, destined to Malta, Gibraltar, or Aden, of steam machinery to Norfolk, or of breadstuffs to a besieged town closely pressed by famine, would be held contraband ; and so would a steamship, unarmed, and with only a navigating crew, if easily convertible into a crusier, bound for an enemy's port in ballast, to be sold in the market. If the new rule is adopted, all circumstances will be shut out, and only what is purely a necessary weapon or equipment for battle can be cut off from reaching the enemy, if the property of a neutral.

But the most important proposal of all is that of Article V. It is scarce possible to limit the effects it may produce upon the duties of neutral states and the industries of neutral countries. It proposes that neutral states shall be required to prohibit the manufacture or exportation of articles contraband of war "qui seraient destinés à l'un des états belligérants." If this means destined to ports or territory of the belligerent state for a market, it is a proposal which we think will hardly be listened to by any state having large manufactures or commerce ; nor would it be much more favored by a maritime state with small means of manufacturing articles of war and dependent for them on foreign trade. A large part of the capital, industry, and skill of the world is permanently invested in the manufacture and transportation, in time of peace as well as of war, of things which all admit to be contraband in case of war. Governments, corporations, and individuals must always be supplying themselves with such articles, not solely in view of possible war, but as a protection against domestic violence, private dangers from men or beasts, for purposes of the chase, civic celebrations, and many public works. That this whole industry, of so permanent a character, shall be subject to such repression and interruption in case of a war between two foreign powers, would be a most serious matter as regards those industries alone. But it becomes still more grave when we remember that the neutral government will be required, at the peril of war or reclamations, to be diligent in the use of detective and repressive force to prevent such manufacture and traffic. If the proposed article refers, as it probably does, only to such goods when intended to be sent and delivered directly to the authorities of a belligerent state, under a contract with such authorities, the objection will be diminished, but by no means removed. If a neutral citizen carries articles contraband of war, which are the property of the belligerent state before their exportation, or which, by a previous contract with such state, he is to deliver into its possession, he may be something more than a dealer in contraband ; he may be liable to be treated as engaged in the enemy's service. If the obligation of the neutral state is confined to the prevention of the organizing and equipping of what is by itself a naval or military force or expedition, or the component parts of one, including vessels of war, it is a reasonable requirement. But it may well be doubted if it will be thought reasonable or even of much practical value to require watch and ward over the making and exporting of separate articles—such as guns, swords, powder, balls, saltpetre, saddles, and harness—though destined by contract for the possession of the public authorities of the belligerent. Whichever be the intent of the article, is it not better that these permanent industries of the world should be allowed to go on in spite of wars between other nations, the private parties interested taking the chance of their capture upon the high seas ?

### BLOCKADE. (ART. II.)

The learned author proposes, in this article, no change in the law of blockade, and no definition of points in doubt. As to notification of an existing blockade, the provision is substantially that which President Lincoln made in his proclamation of April 18, 1861, establishing the first blockade,—"If, with a view to violate such blockade, a vessel shall approach, or shall attempt to leave, any of the said ports, she shall be duly warned by the commander of one of the blockading vessels, who will endorse on her register the fact and date of such warning ; and, if the same vessel shall again attempt to enter or leave the blockaded port, she will be captured." This clause was omitted in the proclamation of 27th April, extending the blockade to the ports of Virginia and North Carolina. Commodore Pendegrast, in a proclamation announcing the actual existence of this blockade, limits this warning to vessels approaching without knowledge of its existence.

Our diplomatic correspondence on this subject was not definite or decisive ; but the prize courts of the United States gave to the paragraph the only construction, it must be confessed somewhat forced, which would not make the proclamation *felo de se*, namely, that it was intended for the benefit of the innocent and not of the guilty. Judge Grier says ('Prize Causes,' 2 Black, 678), "According to the construction contended for [by the claimant], the vessel seeking to evade the blockade might approach and retreat any number of times, and, when caught, her captors could do nothing but warn her, and endorse the warning upon her register. The same process might be repeated at every port on the blockaded coast. Indeed, according to the literal terms of the proclamation, the *Alabama* might approach, and, if captured, insist upon a warning and endorsement of her register, and then upon her discharge." Indeed, under the proposed rule, during a large maritime war, the neutral ports nearest the blockaded region would be found full of fast-sailing steamers, advertised to take cargoes for running blockade, and warranted unwarned. If all that is meant by Art. II. is that such a notification shall be given to vessels having no actual or constructive notice of the establishment of a blockade at sea, it is of little value, such notices having always been legitimate, and used when necessary and practicable. To require them, to the exclusion of other modes of notification, even to an innocent vessel, would be unwise.

### PRIVATEERS. (ARTICLE I.)

As to privateers, the world seems pretty well agreed that the objections to allowing them outweigh the policy and rights of states which are at the disadvantage of having small navies and a large and exposed commerce. Their prohibition is immediately in the interest of great naval powers, and the right to use them is one which smaller states cannot be required to relinquish but by consent. In our civil war we were able to dispense with privateers by the device of establishing a volunteer navy for the period of the war ; and other states having a large mercantile marine may do the same.

### FOREIGN ENLISTMENT OR NEUTRALITY ACTS. (ARTICLES VI., VII.)

These articles bear upon the points arising under the Treaty of Washington of 1871, and the decision of the arbitrators at Geneva.

It may be assumed as now settled that if a neutral state fails of its duty, the absence of adequate legislation or of detective or coercive machinery furnishes no justification. If this absence was without bad faith or gross neglect, it may be an excuse which a belligerent should accept. The importance of the proposed articles on this head lies principally in other directions. They propose to prohibit absolutely in neutral ports "la construction, l'armement ou la vente pour compte de l'un ou l'autre belligérant, de tout bâtiment destiné à être employé comme navire de guerre, croiseur ou transport." They make it the duty of the neutral not only to have the proper machinery but to use it, *bonâ fide*, "avec empressement," to prevent or repress any infractions of these duties attempted or committed. The articles do not use the phrase "due diligence," but make the neutral answerable for the consequences of "toute négligence" in the performance of these duties. These consequences must be such as shall have had an influence upon the contest by affecting injuriously the results of operations of either belligerent. There seems to be no attempt at drawing a line between direct and indirect consequences, or at determining the extent to which the consequences of the injury can be traced, in respect to awarding damages. These omissions are no doubt intentional, and seem to be judicious. It is also proper to bear in mind that M. Calvo does not put forward these articles as the final definitions or the exact phraseology which the declaration should assume, but rather as sketches of the objects and bearing of the proposed rules. Article V., section 2, on the subject of building and fitting out vessels which are intended to be used by a foreign belligerent, does not seem to go beyond the provisions of the British Neutrality Act of 1870, or the judicial constructions which have been given to our own Act of 1818.

Whatever opinions may be entertained as to the expediency of some of the provisions recommended by these articles, and they are fairly open questions, not only the Institute of International Law, but the jurists and statesmen of all nations, are under obligations to M. Calvo for the great pains he has taken in bringing his studies and thought to bear upon these subjects, for the thoroughness of his preparation, and for the unquestionable value of many of his suggestions.

## A FRENCH LOVE-MAKING IN THE LAST CENTURY.

PARIS, February 12, 1875.

THE eighteenth century has been much abused for its frivolity, its levity; and it has, so to speak, abused itself as much as possible in its literature. Whenever we think of the men and women of that period, they appear to us in a sort of decoration drawn by Boucher and Watteau, surrounded with Cupids and with fantastic shepherdesses, in an artificial scenery; they sing and laugh and smile; they ignore sorrow and death and the approaching Revolution; their lives are woven with silks of all colors, and seem like a perpetual masquerade. This is the classic conception of the eighteenth century, but it is, of course, only partly correct; for in the most artificial civilization Nature does not lose her immortal rights. Read Madame du Deffant's correspondence with Walpole, and you will find under her frivolity a depth of melancholy, of *ennui*, which is almost too dreadful. Rousseau touched the inner chords of mankind when he defended nature and what was then called sensibility—that is, the eternal passions of our race. M. de Loménie, who has, more than anybody in our time, shown us the true eighteenth century in his 'Beaumarchais,' has shown in his history of Madame de Rochefort that the men and women of her time had a very remarkable disposition for long, enduring, and passionate friendships. Love was not always found in the bonds of matrimony, as marriages were made and arranged without the choice of the parties. But in the struggle for life of society, partnerships were formed which were often indissoluble.

A correspondence has just been published which is worthy of the greatest interest, as it shows this side of the manners of our ancestors in a very extraordinary manner. It is the correspondence of the once famous Chevalier de Boufflers, who still holds his place among our minor poets, and the Countess of Sabran. Boufflers was so witty that Madame du Deffant could ask herself if he had not as much *esprit* as Voltaire himself. His 'Journey to Switzerland and to Ferney,' written half in prose and half in verse, is very typical; his 'Queen of Golconda' made his reputation as a poet; but he chiefly excelled in those small pieces which are mere trifles of literature. He addresses, for instance, verses to Brilliant, the pet cat of the Maréchale de Luxembourg, and ends thus:

"Luxemboug est votre maîtresse:
Que n'est-elle la mienne aussi?"

Boufflers wrote the 'Queen of Golconda' when he was still in orders; he had the promise of a bishopric, but he did not feel what is called the vocation for the Church. The Abbé de Boufflers was unwilling, however, to lose forty thousand francs in ecclesiastical benefices which King Stanislas of Lorraine had promised him, and he got himself made a Knight of Malta, as this order allowed him to own benefices. He entered the army, and made a campaign in Hesse in 1762. He was colonel of the Chartres regiment in 1777. At the time when he made the acquaintance of Madame de Sabran he was twenty-seven years of age, while she was already thirty-nine. From her portraits, she must have been charming. She had essentially "la grâce, plus belle encore que la beauté"—to use a verse of Voltaire's; eyes full of softness, what the French call smiling eyes; a sinuous and intelligent mouth, an expression of great elegance, distinction without pride. Madame de Sabran, though she did not live at court, belonged to the best society. We find among her friends the Countess of Andlau, a daughter of Helvetius, the Princesse d'Aremberg, the Polignacs, the Countess Daschkoff, and Prince Henry of Prussia, a brother of Frederic the Great, who was, like many Germans of his time, quite a Francomaniac.

Madame de Sabran lived in the winter in a hotel of the Faubourg Saint-Honoré, and in the summer at Anizy-le-Château with her uncle, who was Bishop of Laon. The correspondence begins in 1778, and already Madame de Sabran calls the Chevalier familiarly "my brother." She was a widow with two children, Elzear and Delphine, and soon assumes a maternal tone towards the gallant Chevalier; after a little while she calls him constantly "mon enfant." She falls in love with him, and bids him "Go, be as free as air; use and abuse your liberty; I love you too much to make you feel the weight of a heavy chain. I wish you to be guided towards me by your own will, and not by any politeness or obligingness; I will not be happy at your expense." This marks the nature of the first relations between them; she feels the difference in their ages more than he does; she is afraid of losing him, and treats him like a spoiled child. There is so much real affection in her charming letters that one cannot help wondering why she does not marry him, though she is twelve years older than he is. Alas! Boufflers had too much ambition; he knew that he would lose his benefices by marrying. Madame de Sabran had a good fortune, but he did not wish to bring her nothing but his name; he tried to conquer a good, a great position; and it must be said to his credit that he did not hesitate, in order to win the right of marrying Madame de Sabran, to suffer the greatest hardships. He accepted a mission to Senegal. Boufflers in Senegal! No greater sacrifice can be imagined; the pet of the salons of Paris, the refined poet and soldier, under the tropics among the savages. His journal from Senegal to Madame de Sabran shows us a new Boufflers, not the artificial author of the 'Queen of Golconda,' but the natural man. He left for Senegal in 1785, and returned for a few months the year after to take his seat in the French Academy. He again went out to Senegal, and came back on the very eve of the Revolution, in time to be named deputy to the States-General in Lorraine. The Revolution broke up all his plans: his long efforts had been vain; he did not conquer the fortune, the position, which seemed so necessary to him.

From the tone of the correspondence and of the journal from Senegal, it can hardly be doubtful that Boufflers and the Countess had been secretly married, probably at the time of Boufflers's first return to France. She calls him constantly "mon mari" after that period, and she makes many allusions which seem to prove what I here advance. When they both became exiles she was already getting old, they both were poor; but they solemnized their marriage at Breslau in 1797. They came back to France in 1800, and Boufflers had to accept a small pension from Napoleon. He died in 1815, at the very moment when his name could have called him to the new House of Peers. His wife, though she was older than he, survived him twelve years; she composed her own epitaph, which is quite worth remembering:

"A la fin, je suis dans le port
Qui fut de tout temps mon envie;
Car j'avais besoin de la mort
Pour me reposer de la vie."

There is a real touch of melancholy in these four lines, a sense of weariness which is sometimes felt also in the long correspondence of the two lovers. Imagine Boufflers in Senegal, Madame de Sabran in the midst of the polite society of Paris; the difficulties of such a correspondence are much greater than can be imagined, for after a while it seems as if the correspondents had no longer anything in common. Madame de Sabran speaks in some of her letters of the book she is writing on manners and society; she had good opportunities for observation, and her remarks on the men and women she sees are very acute. She belongs to the great moralistic school which has never been interrupted in France, from La Bruyère to Vauvenargues. She has what the French call *le trait*, a word which I cannot well translate. For instance, speaking of a man who had just died, she says: "He was the Solomon of our age, *à la sagesse près*" (the wisdom excepted). She describes herself in a drawing-room with an ambassadress, with Madame de Boufflers, the cousin of the Chevalier, and with Madame de Cambise. "I was comparing their various modes of being witty; the ambassadress had chosen the most amiable, Madame de Cambise the most refined, and your dear cousin the maddest." "Marshal Soubise," she says, in another place, "has had a fit; he is now struggling with death, and there is no appearance that he will have the best of it, for he is not accustomed to victory" (an allusion to Rosbach). But Madame de Sabran does not indulge much in criticism; she is of an affectionate disposition, and, what is more striking than anything, under all her *enjouement* there is a perpetual sadness. She had been married as a child to M. de Sabran, who was fifty years older than herself; she had hardly known him; all her affections were centred in her two children and in Boufflers, and Boufflers was away. She knew that when he returned he would find her an older woman: "The days are marching; old age is coming; by what *charms* will you be held by me, by gout or rheumatism?" In another place she says: "You are my God. If I had suffered for the *other* the thousandth part of what I have for you, I should be sure to go to Paradise with a martyr's palm. I have not chosen well. I have attached myself to a master who is light and capricious, who cannot see in my heart the depth of the tenderness I feel for him, and who abandoned me to my weakness at the very moment when I most felt the need of aid and of consolation." This extraordinary separation of two lovers, caused by mere worldly ambition, reminds me of the Latin phrase, "Et propter vitam, vivendi perdere causas." In order to secure future happiness, they renounced all happiness; they lost the best years of life—Madame de Sabran in idle regrets, Boufflers in a vain struggle with fortune.

Boufflers's journal in Senegal has an intrinsic value, if you look upon it not as a mere chapter of a love-story. It shows in very minute details the state of colonization in Saint Louis in the last century, the character of the French agents, of the French navy of that time. Boufflers appears in it in a favorable light, humane, a slave of his new duties, intelligent, active; of course his heart is always in France, in Paris, and the best part of it goes to his charming correspondent, though she always fears that he does

not give enough of it, and is certainly the more generous of the two correspondents.

What has become of the family of this most amiable person? She had two children, Elzear and Delphine. Elzear became, I might almost say of course, the occasion of much trouble to his mother. He was lazy, without character; the emigration threw him into Germany; he returned to France in 1800 with his mother, became a sort of a familiar slave of Madame de Staël, and used to spend weeks at Coppet. He tried his hand at some fables; he wrote a comedy for Madame de Staël; he was a very ordinary man, and he died without having married. Delphine had inherited the wit and loveliness of her mother. She married M. de Custine; she saw her father-in-law and her husband mount the scaffold during the Terror, and remained in Paris with a young child at the risk of her own life. She lived much, till the end of her life, in Normandy, in the Château de Fervaques. Her son is still alive, but he has sold Fervaques. Madame de Sabran died, as I have said, in 1827; she spent the latter part of her life with Elzear, living chiefly on the memories of the past, a phantom of a bygone age among the new society which sprang out of the Revolution.

# Correspondence.

## "RHETORICAL TRAINING."

To the Editor of The Nation:

Sir: In the last number of the *Nation* is an article adverse to the teaching of rhetoric in our colleges. The argument seems to be this: Oratory without thought is vain; *ergo*, let there be no teaching of oratory. (Faith without works is dead; therefore, let us not teach faith.) Is this logical? Yes, if the two are inconsistent. If the trained thinker cannot, in the nature of things, write or speak well, and *vice versâ*, we must make our choice. If training the mind to think well cannot go on with training it to the best methods of expression, we are brought to the dilemma—otherwise, not.

It seems to me that the opponents of rhetorical training in our colleges fall into the mistake, or resort to the fallacy, of sliding from rhetoric to declamation, and from declamation to "spouting." Are they convertible terms? They are so used in your article. You say, and justly enough, that fluency, glibness, ease, and assurance on one's feet are common enough in this country, and that "what we need is not more glibness or assurance, . . . but well-ordered brains." True; but what follows? Are we to train the intellects of men who are to be senators, barristers, preachers, and lecturers, and not train their powers of expression? Your article is apropos of Mr. Tracy's reading a manuscript speech to a jury for six days. Why did he do this? I presume it was because while he could think well, reason well, and write satisfactorily, he could not trust himself to extemporaneous utterance. Now, look at Mr. Evarts, who will close the case. He is a clear, strong thinker, with "well-ordered brains," and he can trust himself to extemporaneous utterance, and never writes out a speech. He left Yale College and Harvard Law School the best orator and debater of his day, able to think while he spoke, and speak as he thought and felt. Most of the good and useful speakers, as well as the great orators, have trained themselves in elocution from the earliest, and most assiduously, and especially those in whom the training least appears, whose style is the most pure and simple. There is no rule for great geniuses; but systems of education cannot be based upon such exceptions. And great geniuses do much more of training than the simple suppose. Of our own Massachusetts orators, Ames, Webster, Choate, Channing, Buckminster, Everett, Phillips, Garrison, all were assiduous cultivators of the powers of utterance from boyhood up. (The notion that Webster was not a speaker at college is a mistake. See his 'Private Correspondence,' Vol. I., pp. 46, 50, 52, 53, and 67.) And how has it been with Pitt, Canning, Peel, Gladstone, Lowe, Roundell Palmer, and most Oxford and Cambridge men who have risen to fame—to say nothing of Greeks and Romans—not as declaimers and spouters, but as men who could express thought, will, and emotion by extemporaneous speech before large numbers most effectually?

I agree in your dislike of the intercollegiate rhetorical exhibitions in large, crowded halls in our cities; but, for the reasons so well set forth by Gov. Chamberlain a few numbers back, not because rhetorical training is undesirable.

Perhaps all your article meant to do (although it said much more and otherwise) was to deprecate a growth of declamation at the expense of mental training. But here again what is the remedy? Is it not to encourage mental training to the utmost, and to do the utmost to secure at the same time a rhetorical training which shall deliver us from the vicious habits of this country and generation? Is it a condition, on which alone the well-trained brain can be had, that it shall leave college a mute? Must a man so trained leave college with all the defects of utterance, station, and gesture he brought there from an uncultured home, or with the tricks he took in insensibly from the poor declaimer or uncouth wrangler or wit of the country bar, or village pulpit, or platform; or, quite as bad, with the vicious declamatory style he learned from some tasteless teacher of elocution in a pretentious "institute" or "academy"? It is an ill-considered position, if not a vulgar prejudice, to suppose that training in rhetoric and elocution, whether in writing or speaking, means the increase of fluent, easy writing or fluent, declamatory speaking—in short, that rhetoric means what is called "mere rhetoric," which means either vicious rhetoric, or writing or speaking by men who have too little to say. Rhetoric is the art of enabling men who have something to say to say it to the best advantage. Much of the teaching of rhetoric is the unlearning of bad habits, the rooting out of false notions, and the substitution of the best models for the worst. Do boys come to college free from all habits or predilections as to speech? Certainly not. They have been picking up and adopting bad habits and false notions of elocution from their cradles up. They do not come to college natural, unsophisticated readers and speakers, whose only dangers lie in non-natural, artificial styles which may be taught them there. On the contrary, most of them come to college with styles of reading and speaking as unnatural, as affected, as conventional and traditional, as any of the tricks and habits of the stage; and this is as true of the yeoman or mechanic's son from the country as of the prize declaimer from the city school—indeed, it is more true of the former. There is as much affectation and conventionalism, as far a departure from nature, in the awkward, tobacco-spitting, nasal, popular orator and wit of the country bar or the vociferating revival preacher, who are the models of one class, as in the boys, however unfortunately trained to public speaking, in our higher schools. Both have much to unlearn. So it is with writing. Does the youth come to college without a style, or without tastes or predilections as to style? What shall we say of his daily reading of cheap papers and magazines and novels, and of sensational speeches and lectures?

The truth is, the function of the teacher of rhetoric in our colleges, whether it be in writing or speaking, is not to impose on the student an artificial style, not to promote affectations, traditions, "fluency, spouting, and assurance," but largely to make men unlearn bad tricks, discard bad habits, rectify vicious tastes and notions, and chiefly, in this country, to unmake declaimers and spouters, and to accustom young men to purer models and higher styles of reading, writing, and speaking, where they are but the most natural and effective agents for the transmission of thought and emotion from man to man. It is to enlarge the views and widen the experience of the early follower of the one model. It is, in fine, to restore, as far as can be done, the broken relations between thought and expression, emotion and utterance; to enable the man of brain and affections to put himself into communication with the minds and hearts of other men under the most favorable circumstances.

Your article deprecates oratory before a man has anything to say. At school the boy's training in elocution should be largely voice, in reforming and curing, and strengthening and varying, the functions of utterance, and accustoming the boy to stand on his legs before others in reading aloud, in oral recitations of lessons, and in speaking the thoughts and emotions of others, in prose and verse, which he can understand and feel, though he is too young to originate them. Men enter college now (I speak of Harvard) at the age of nearly nineteen, on the average. Have men from nineteen to twenty-three, educated as well as America can educate, nothing to say? If not, when will they have something to say? Shall their training and practice be put off until they preach their first sermon at twenty-six, or argue their first cause at thirty, or make their first speech in Faneuil Hall? I grant that bad early teaching in elocution, whether declamation or reading, is especially injurious. But it need not be bad at college. Few men left Harvard in Professor Channing's time who have not, in later life, thanked his memory for his teachings, drillings, and criticisms, all tending to bring back to what we call nature in public utterance—that is, to what the best taste shows to be the most fitting and effective, however various, and however much individual qualities and idiosyncrasies are respected and preserved.

R.

Cambridge, March 6, 1875.

["R.'s" synopsis of our argument is hardly correct. The argument is—Oratory without thought is vain; rhetorical training in youth is apt to promote oratory without thought, and make it seem

a good thing. Moreover, this training is not necessary to produce the only things it can produce—fluency and assurance—because they are common enough without it; *ergo*, rhetorical training is undesirable. We never meant to maintain that a young man's powers of expression, any more than his other powers, cannot be improved by training. Defects of pronunciation or intonation can, and of course ought to be corrected in youth, and are hardly corrigible after youth is past. We doubt extremely, however, whether they have ever yet been cured by a professor in college. Purity of accent and clearness of enunciation are almost always the result of assiduous efforts on a man's own part to follow models of speech which are constantly within his hearing—or, in other words, those of the society in which he lives, his own family or his friends and companions—or of unconscious imitation of them. We have heard of the acquisition by girls who had plenty of time for it, more than a young man can ever give, from the steady teaching of a "tone master," but we have never happened to see or hear of a young man who got them from class-room exercises. The ordinary lesson in "elocution" we take to be, in ninety cases out of a hundred, futile. It may now and then help a natural orator to rid himself of glaring tricks of manner, or to improve some of his own methods; but, in so far as it attempts to enable a cold or timid man, who is not a natural orator, to go through an orator's motions, and produce sham fire, and simulate that unconscious action of the brain on the muscles which alone can produce lawful and honest gesticulation, it is simply a deceitful process, of which the only result is "rhetoric" in the narrower, though now ordinary, sense of the term. The cases which "R." cites of American and English orators who were "assiduous cultivators of the powers of utterance from boyhood up," seem to us to strengthen our position. These men were all either natural orators or had such a strong sense of the necessity of rhetorical powers—in order to open to them a field for the display of other and higher powers—that they trained themselves diligently in speaking. We maintain that such men will always do so, and that the best safeguard against the growth of bad rhetoricians and against the elevation of rhetoric into undue prominence, is to be found in leaving this training to the student's own conviction of its necessity to him, in order to complete his equipment. It will thus come as an appendage to thorough culture and really high ambition, and not as a cloak for laziness, windiness, and mediocrity, as it is so often in public life. If ducks were rational and we could train them, we would of course devote ourselves mainly to impressing on them the necessity of laying eggs and getting fat, feeling sure that a right-minded duck would under this teaching certainly take her daily swim, as necessary to her higher development; we should be careful not to preach to her the enormous importance of swimming as an accomplishment, knowing well that she would go to the water naturally in any case, and that good-for-nothing ducks would spend most of their time in it.

This is not really as far-fetched a simile as it may seem at first sight. As we said last week, good delivery has become an inherited trait of the race on this continent. We appeal to everybody who hears much public speaking to say whether bad delivery, or awkward or incorrect language, are not very rare, on the platform, in the pulpit, in Congress, or at the bar. Nearly every American who attempts oratory at all has a good enunciation, produces well-turned sentences, and has a graceful and easy manner. If you frequent the House of Representatives, you will find that the trash which fills so large a space in the *Congressional Record* has been rolled off with a certain finish which almost disguises its quality until you see it in print. In fact, we know of no reason, in one's experience of American forensic life, for supposing that the neglect of rhetoric by school or college produces any bad results. On the contrary, we see many reasons for suspecting, in the absence of precise knowledge on the subject, that it is unduly cultivated, to the neglect of better things. Now if, as we believe, the curriculum of colleges ought to be framed with some reference to the prevailing social or political tendencies of the day, there can be little doubt that the duty of American colleges towards oratory is to encourage orators to seek the things in which they are plainly most wanting, for which the public at large offers fewest premiums, which are hardest to acquire, and which are the basis or root of all oratory. The tendency of the time is, as we all see, to overrate fluency and assurance, to underrate knowledge and mental discipline; and the highest duty of a university is to counteract this tendency, and restore the balance between thought and expression.

We do sincerely deprecate speech-making by boys, although we have nothing to say against the exercises in elocution which "R." recommends; and we do not believe that young men under twenty-one or twenty-two have, in the great majority of cases, anything to say worth saying in public, and we think it a great misfortune for a young man to be led into supposing that he has. During his undergraduate course he is, if a bright fellow, in a fever of enthusiasm over his discoveries of things with which the rest of the world has long been familiar, and is busy filling his memory with ideas and passages which he is not able to digest from authors whom he is not competent to weigh. This is useful work, if it is kept in its proper place. It is not useful, but hurtful, if his seniors encourage him to believe that it is all that is needed to qualify him to instruct the public.

If we may be allowed to close criticism with a suggestion which is the result of much observation, we will say that the most efficient and safest mode of teaching the art of expression, whether oral or written, to immature persons, is simple narration. Nothing is more difficult, from a literary point of view, than clear and correct narrative. The number even of practised writers who are capable of it is small. There can be no better exercise in the choice of words, in the construction of sentences, in memory and arrangement and perspective, than it affords. To require a student to recount a complicated transaction, on his legs or with his pen, without flourish or ornament, putting the facts in their proper order, giving each its due amount of space, and keeping clear of vagueness or cloudiness, is to give him the best sort of rhetorical training, and the only safe sort. It cuts off all temptation to "spouting" and all opportunity of shirking, or of filling in vacant spaces with sound, and represses all false notions of his own powers. The flights of fancy, the ornament, the unearthly wisdom, the long foresight, the burning patriotism, the deep disgust over the degeneracy of the times, had better come later, if they are to come at all, as the result of real feeling and larger experience and of noble ideals.—Ed. Nation.]

## Notes.

J. B. LIPPINCOTT & CO. have in press 'Travels in Central India (L'Inde des Rajahs),' by Louis Rousselet, profusely illustrated; and 'English-Gypsy Songs,' in Rommany, with metrical English translations, by Charles G. Leland, Prof. E. H. Palmer, and Janet Tuckey.——The sale is announced in April of a part of the valuable library of Mr. Thomas W. Field, viz.: works relating to the American Indians (described in his 'Essay towards an Indian Bibliography'), and to the American Revolution and War of 1812, and the historical collections of the various societies in the United States. The catalogue is in preparation by J. Sabin & Sons, 84 Nassau Street, who say of the Indian collection that it is by far the largest of the kind ever sold in this or any other country.——The *American Bibliopolist* for February contains a complete and racy exposure, by Mr. Sabin, of the Banvard-Brown "£1,000 book hoax," a matter with which we have not troubled our readers, though it will always deserve a place among the curiosities of advertising. The book ('The Life of a King') has since appeared, and, so far as the editor's part is concerned, bears about the same relation to literature that his panorama did to a Turner landscape. The dedication, however, is not lacking in ingenuity: "To those of my Southern fellow-citizens who once expressed a wish to be governed by a British prince."——The third Statement of the (American) Palestine Exploration Society is devoted to an identification of Mount Pisgah by Prof. John A. Paine, the Society's botanist and archæologist. The discussion is an exceedingly interesting one, and is marked by caution as well as candor. Due credit is given to Saulcy and the Duc de Luynes, while the pretensions, misstatements, and romancing (to give it a mild name) of Dr. H. B. Tris-

tram are unsparingly exposed. The application of the test of the view from Mount Pisgah (Jebel Siâghah) appears to confirm Prof. Paine's identification in every respect. Non-contributors to the funds of the Society will receive an ample return for the fifty cents required to purchase this pamphlet. The financial secretary's office is at 78 East Ninth Street.——The *Geographical Magazine* for January contains a map of tropical South Africa, prompted by the news of Lieut. Cameron's discovery of an outlet to Lake Tanganyika, the River Lukuga. The western goal of this persevering explorer, the Congo coast, is beautifully shown in detail in Petermann's *Mittheilungen* for December 31, 1874, with reference to the hitherto not very successful labors of the German African Expedition; and a side-map shows the entire unexplored field of Central Africa, which this Expedition has appropriated to itself. The three plates of Part 25 of Stieler's Hand-Atlas are (1) a North Polar chart, remarkable also as embracing the whole of the Russian possessions; (2) an admirable map of Europe, physical, political, and statistical, in which the depth of the ocean and of all the internal waters is geographically shaded as well as expressed in fathoms; (3) a map of the East Indies (New York: L. W. Schmidt).

—The eighth edition of the 'Encyclopædia Britannica,' begun in 1852, was completed in 1860. Volume I. of the ninth, edited by Dr. Thomas Spencer Baynes, is now before us (Boston: Little, Brown & Co.) The typographical features of the work are those with which the present generation is familiar, and the usual topics have been chosen for the steel-plate illustrations at the end of the volume. To the end of time, we suppose, Aeronautics, and Agriculture, and Anatomy, and Africa, and America will be thus delineated in the Encyclopædia. With balloon-pictures, indeed, the Encyclopædia is associated in our earliest recollections, and it would not be quite the same thing without them; nor, sentiment apart, do we think that too much importance or interest is ascribed to an art which has thus far been attended with so many costly failures, and so little substantial benefit to mankind. When we add that woodcuts are inserted in the text with tolerable frequency, we need say nothing more of the external appearance of the work. The plan of it as distinguished from that of other encyclopædias is well known. It aims to give a résumé of the present state of knowledge concerning the chief objects of human study and research, and to do this in broad and comprehensive articles rather than in detail; in other words, it is less a dictionary than a collection of treatises—less a work of reference, strictly so-called, than a means of self-education, an instrumentality for private culture. It may be imagined, however, that this line cannot be sharply drawn, and in fact the editor admits that the recent progress of science renders necessary a much greater subdivision than formerly. The treatment of controverted questions which he marks out as proper for the 'Encyclopædia' is critical and historical rather than dogmatic, and he gives evidence of his impartiality in his selection of contributors. He acknowledges his obligations to Huxley and Clerk Maxwell for hints as to the headings under which modern science should be distributed. To the former he entrusts the Animal Kingdom (in Vol. II., Vol. I. ending with Anatomy); to St. George Mivart, the Ape; to E. B. Tylor, Anthropology; to A. R. Wallace, Acclimatization; to Proctor, Astronomy; to Sidney Colvin, Art, etc., etc.

—In biography, the 'Encyclopædia' continues to omit notice of all living celebrities, so that, for instance, one finds neither Ali Pasha nor Alexander II. of Russia; and Abd-el-Kader is admitted only out of deference to the report that he died at Mecca in 1873—Brockhaus makes him still living at Damascus. This department, as well as geography and statistics, is less full in the 'Encyclopædia' than in the 'Conversations-Lexikon,' and the reference to authorities is much more consistently and amply provided in the German than in the English work. Typical of the difference between them are the extended articles, elaborately illustrated also, on Abattoir and Abbey and Abbot, which are wanting or but cursorily treated in Brockhaus; and the article on the cave Adullam. The 'Encyclopædia' speaks of the common humorous allusion to this resort of those in distress, in debt, or discontented, but gives no later example than 'Waverley.' Brockhaus, on the other hand, having in view what is fresh and current, and likely to come up in conversation, adds an article, Adullamites, devoted to an account of Mr. Bright's famous application of the cave in 1866. Abyssinia, Afghanistan, Africa, and America are treated at great length in the 'Encyclopædia.' The last-named will naturally be most critically scrutinized in this country. In the general sketch of the discovery of the continent it is somewhat surprising to meet with no allusion to the origin of the name, nor to Americus Vespucius in a chronological list of the early voyages and settlements. In discussing the aboriginal American languages, the writer gives nearly a page of extracts from Prof. Whitney's 'Language and the Study of Language.' The article on American Literature is written with knowledge and discrimination, and will, we believe, cause no ruffled feelings on this side. It is inspired, too, by the best feeling towards the United States, as this friendly admission may indicate: "Few Americans have ever so misconceived a British statesman as we misconceived Mr. Lincoln, or gone so far astray in regard to any crisis of our history as we did in reference to the moving springs and results of their Civil War." The estimates placed upon Emerson, Lowell, and Hawthorne, among others, are worth reading, and will command respect if not general assent. We notice but one misprint of an American name—*Hilliard* (Geo. S.) for Hillard; and the writer has not been careful to make it understood of English readers that N. P. Willis has been dead some years.

—A correspondent, writing from Baltimore, asks: Is it not likely that Shakspere, in giving that trait of Hotspur's Kate,

> "Indeed, I'll break thy little finger, Harry,
> If thou wilt not tell me true"—
> [*I. K. Henry IV., II.* 3],

had in mind the following passage of Polydore Vergil, referring to the same lady?

"Saeva in familiares, petulans etiam erga maritum, cujus secreta se exquaesituram minitabat, vel *frangendo digitorum ossicula*, si veritatem pandere constantius recusaret" (xxvi. 2).

The old historian seems to think it a rather serious business. It is odd that this has escaped the notice of all the Shaksperean commentators I have access to.

—It does not very often happen that the authorship of an anonymous publication of the fifteenth century comes to light at this late day. It will, therefore, interest bibliographers to learn that an old manuscript note in a black-letter volume of that period, belonging to one of our public libraries, seems to indicate, with tolerable certainty, the author's name, which, so far as can be ascertained, has hitherto remained unknown. Among the early-printed books in the library of the Cornell University is a thin, admirably-preserved folio, possessing the broad margins, the beautiful, jet-black typography, and the rubricated initials so dear to the heart of the ardent bibliophile. It has neither title-page nor colophon; neither date, place, nor printer's name, and consists of forty-two folios, of which the first, thirty-third, and thirty-fourth are blank, the final signature, on the last leaf but two, being E4. Each page is made up of either thirty-six or thirty-seven lines, and the water-mark of the paper is a unicorn. The book is altogether unknown to Panzer, but a tolerably accurate description of it will be found in Hain (No. 6,066), who gives neither the date nor the name of the author, but states that it was printed by Arnold Therhoernen (ter Hoernen), a printer who exercised his craft at Cologne from 1471 to 1483. It is to Arnold ter Hoernen that the introduction into typography of Arabic numerals is ascribed, and they are sufficiently common throughout this volume in the many citations of chapter and verse from the books of the Bible. The title of the book occupies the first line and a half on the second folio or first printed page, and, with the abbreviations written in full, reads as follows: "Declaratio quedam modi et forme venditionis et emptionis reddituum perpetuorum et vitalium." At the end of this title, filling out the line in the text and continuing the sentence, are written these words: "magistri Gherhardi de elten ordinis predicatorum." The handwriting, and the abbreviations used, indicate that this note was written not long subsequent to the publication of the book—certainly not later than the early part of the sixteenth century. This manuscript annotation has not been correctly read by a later possessor of the volume, who has attempted to write it out in the upper margin as follows: "Eximii Magistri Fratris Everhardi de Alten ord. pred Declaratio," etc., mistaking *Gh* in Gherhardi for *Ev*, and *e* in Elten for *a*. The author of the volume, therefore, without much doubt, is Gerardus de Elten, or, in the vernacular, Gerhard von Elten, who was probably born at Elten, a small Rhenish town not very far from Cologne. He was a Dominican, and the only work which Panzer ascribes to him is a theologico-legal tract, of a character similar to this one, entitled 'Super receptione puerorum ad religionem'—a dissertation on the lawfulness of admitting boys to a participation in the rites of religion before they have attained the age of puberty. This was also printed by Arnold ter Hoernen at Cologne—a fact which may be taken as corroborative of the statement made in regard to the authorship of the 'Declaratio.' A second and last edition of the 'Declaratio' was printed at Memmingen, Bavaria, in 1494, still without the name of the author. The copy of the first edition which we have here described contains the book-mark of "Georgius Kloss M.D. Francofurti ad Moenam"—who published at Frankfurt in 1811 a surgical work in Latin—and a note on the inside of the cover giving the date of the volume as 1480, which is more than likely to be correct. The only

work in which a notice of Gerhard von Elten is to be found is Quétif's 'Scriptores Ordinis Prædicatorum' (Paris, 1719–21), which is unfortunately a rare book on this side of the ocean, and cannot, therefore, be easily consulted.

—Mr. Seymour Haden, one of the most eminent of the English medical profession, has written to the London *Times* on the present mode of interment, and the proposed substitute of cremation. At the outset he invites a consideration of the following propositions: 1. That the natural destination of all organized bodies that have lived and that die on the earth's surface is the earth. 2. That the evils which the cremationists would have us to believe are inseparable from the principle of interment are independent of that principle, and wholly of our own creation. 3. That the source of these evils is to be found not in the burial of the dead, but in the unreasoning sentiment which prompts us to keep them unburied for as long as possible, and then to bury them in such a way that the earth can have no access to them. 4. That the burial of the body supposes its resolution by the direct agency of the earth to which we commit it; and again, that the earth is fully competent to effect that resolution. 5. That to seek to prevent this beneficent agency by enclosing the dead in hermetically-sealed coffins, brick graves, and vaults is in the highest degree unphilosophical, since it does but engage us in a vain resistance to an inevitable dispensation, and since it has led us to accumulate in the midst of us a vast store of human remains in every stage and condition of decay. 6. That the remedy for such evils is not in cremation, but in a sensible recognition of, and a timely submission to, a well-defined law of nature, and in legislative action to enforce the provisions of that law. Mr. Haden never loses sight of the fact that what under "the influence of the air was putrefaction, in the earth is resolution; that which was offensive becomes inoffensive; that which was decay, a process of transmutation." There are two methods of excluding the air from a dead body—the direct and natural method of placing it in the earth, and the evasive and unnatural method of enclosing it in an air-tight coffin.

—In answer to his own question, "How, then, are we to bury our dead?" Mr. Haden says:

"Clearly, within a reasonable time of their dissolution and in coffins, if we must have coffins, of such construction as will not prevent their resolution. No coffin at all would, of course, be best, or a coffin of the thinnest material, which would not long resist the action of the earth, or a coffin the top and sides of which admitted of removal after the body had been lowered into the grave, or a coffin of some light permeable material, such as wicker-work, open at the top, and filled in with any fragrant herbaceous matters that happened to be in season. A layer of ferns or mosses for a bed, a bundle of sweet herbs for a pillow, and as much as it would still contain after the body had been placed in it of any aromatic or flowering plant for a coverlet—such a covering, in short, as while it protected the body from the immediate pressure of the earth as effectually as the stoutest oak, would yet not prevent its resolution. I can conceive no better form of coffin. Let us emulate the healthy sentiment of those older Jews who considered it an indignity and an injury to be refused prompt burial, and so to be made an offence to the living, and bury it while it is fresh and lovely, and while, if we feel it to be an effort and a sacrifice to part with it, we may also feel that we are making that effort and that sacrifice in the cause of the dead."

Further on it is pointed out that as a body, properly buried, is resolved in five or at most, six years, it follows that, at that interval or at intervals as much longer as we please, we may bury again and again in the same ground, with no other effect than to increase its substance and to raise its surface. Mr. Haden concludes his long and interesting letter by a protest against the wild project "to drive into vapor the bodies of the 1,600 people that die weekly in London alone," and he asks pertinently enough, "What are we to do with the residuum, with this six, eight, or ten pounds of solid matter (the average weight, by the way, of the Egyptian mummy) that the furnace is incapable of driving off?" The letter has caused much excitement and correspondence from high and low, expert and inexpert, and the *Times* was justified in its remark that it is seldom that a question which concerns everybody, and which is beset with prejudices and interests, is so carefully, sensibly, and reverentially treated as it has been by the writer of "Earth to Earth."

—We were at a loss to account for Judge Goodrich's fierce onslaught upon Christopher Columbus, lately noticed in these columns. It is just possible that he had heard of the request made to the Vatican Council to consider the claims of Columbus to beatification. Count Roselly de Lorgues, a biographer and infatuated admirer of the great navigator, is the prime mover in this holy work, and is said to have met with great encouragement at Rome. He has accordingly, while awaiting the reconvocation of the Council, prepared a work called 'L'Ambassadeur de Dieu et le Pape Pie IX.,' which has been described as a complete tractate on the religious and mystic life, the predestined vocation and mission, and the apostolic virtues of Christopher Columbus. Since the apostolic times, he asserts, no one has been greater in the world or in the church than Columbus; and he shows how revelation of the latter's mission was seasonably made to Job, Isaiah, and Malachi. All this must be as fuel to the Protestant flame of Judge Goodrich; but would he not do well to revise some of his epithets in the light of the Comte de Lorgues's Part II.—"a luminous grouping of all the evidence as to the eminent degree attained by the cardinal and divine (*théologales*) virtues of Christopher Columbus"?

—No other French work which has recently fallen under our observation promises so much amusement as the foregoing. The following deserve nevertheless to be mentioned. Mr. Tracy's performance in Brooklyn, as exhibiting a regrettable tendency of the American bar, should lend interest to Théodore Froment's 'Essay on the History of Forensic Eloquence in France before the Seventeenth Century,' and the complementary work by the same author on 'The Eloquence of the Bar in the first half of the Sixteenth Century.' They are valuable also in a biographical point of view. One of the jurists celebrated by M. Froment, the Chancellor Pierre Séguier, has been made the subject of a separate work by René Kerviler, who is an ardent and in some respects a successful apologist of the man to whom French letters as well as French jurisprudence owe much. Another order of talent and discipline is criticised in 'Nos Diplomates et notre Diplomatie' by Louis Lherbette, to which M. Picard furnishes a preface. Prof. Casimir Gaillardin, in the second part (vols. iii. and iv.) of his 'History of the Reign of Louis XIV.,' entitled "The Epoch of Power and Glory under Colbert and Louvois," and Pierre Clément, in his 'History of Colbert and his Administration,' cover similar ground. The latter is a posthumous work, an abstract and popularization of the same author's 'Lettres, Instructions et Mémoires de Colbert'—two volumes replacing nine, of course with the omission of proofs and documents. Teachers of the classics may profitably examine the Abbé Fabre d'Envieu's 'Onomatologie de la Géographie grecque,' which he also calls "the art of learning the Greek dictionary by studying the geography of ancient Greece and its colonies"—a novel plan, which would seem not without its advantages; 'Aldus Manutius and Hellenism at Venice;' Jean Aicard's 'The Venus of Milo,' being researches on the discovery of this statue based on inedited documents; and, when it appears in print, M. Dezeimeris's dissertation on the author of the *Querolus* of Plautus, a play which he attributes to one Axius Paulus, an Aquitanian, known as the author of a comedy called *Delirus*, the copyists being held responsible for the change of name to Accius Plautus. Long purses may be recommended to subscribe to 'La Musée Fol,' published by the city of Geneva in illustration of its museum of that name—a rich and choice collection of antiquities, and art-objects of the Renaissance. The volume already issued is a folio of 87 pages of text, with 32 plates and 29 vignettes, and is occupied with antique terracottas, the essay on this subject being by M. Fol himself. Finally, let us mention here the proposed printing in 10 quarto volumes of La Curne de Sainte-Palaye's 'Glossary of the French Language from its Origin to the Time of Louis XIV.'

—M. Auguste Brachet, so favorably known by his 'Grammaire historique de la langue française' and 'Dictionnaire étymologique,' both of which have been translated into English, has just rendered his native tongue another service in a work intended to illustrate the language and literature of the sixteenth century. It is entitled 'Morceaux choisis des grands écrivains du XVI^e^ siècle, accompagnés d'une Grammaire et d'un Dictionnaire de la langue du XVI^e^ siêcle' (12mo; Paris: Hachette et Cie.) We suppose M. Brachet intends to lead his countrymen gradually back to the first period of their literary glory, the marvellous thirteenth century. From that the transition to the Chanson de Roland would be easy enough. It is strange that the French, who in national matters pass for a vain people, should so long have neglected their early literature, which has found its most zealous students in Germany. This neglect, however, is in a fair way of being repaired by the efforts of such men as Brachet, Meyer, Paris, and others; and we are glad to learn that the interest excited by their labors has led to the formation of an Early French Text Society, which, from the list of works promised, seems to embrace Provençal as well as Old French. Among these works are: Aiol, 'La Bataille de Roncevaux' (the modernized version of the Chanson de Roland); Tristan, the works of Crestien de Troies and Marie de France (already frequently printed in Germany and France); 'Le Roman de Berinus'; 'Le Roman des Sept Sages' (published by the Stuttgart Litterarischer Verein) in Provençal and French, the former version, which is as yet inedited, and not known to Provençal scholars, being likely to prove only a translation from the Old French; 'Girart de Roussillon' (this poem, it is well to bear in mind, has nothing to do with the celebrated Provençal epic

of the same name); the chansons of Thibaut, King of Navarre, collections of farces, and mysteries, etc. The annual subscription is 25 francs, or life-membership 250 francs; an entrance fee of 10 francs will be charged to all members after the first 300.

—Of the volumes of papers presented to the first International Congress of Orientalists, held in Paris in 1873, the first is recently published, and in process of distribution to the members; for the second, additional funds are needed, and Mr. Van Name, Librarian of Yale College, is authorized to receive a certain number of new subscriptions at the original amount, twelve francs, entitling the subscriber to the publications of the Congress. For the second meeting, at London, last September, Messrs. Trübner & Co. may be said to have already published its transactions in an extra number (3s. 6d.) of his *American and Oriental Record*. It is a pamphlet of only about sixty pages, but these are of immense size, and in part of very close print, double-columned, so that the amount of material included is far beyond what would be believed possible. We have all the presidents' and chairmen's addresses in full; a large number of papers unabridged, besides others in briefer or longer abstract, and the more important of the oral remarks and discussions; with a parcel of miscellaneous matter relating to the meeting, the organization, the entertainments, and the like—in short, an account of the whole affair. The addresses especially are in good part popular *résumés* in different branches of Oriental study, and of an interest quite as much popular as scholarly.

—The compilation of a dictionary of living authors and their literary offspring is apt to be a thankless task. Users of such books are not particularly appreciative of the patient drudgery and wearisome searching entombed in them. The moral courage requisite to the undertaking must be considerable. Somebody is sure to die just in time to render the fresh tale of the types incomplete, and some omission of importance is highly probable. We were led to these reflections on examining a new book of this kind. A Saxon clergyman (Dr. Wm. Haan) has published a 'Sächsisches Schriftsteller-Lexicon' (Leipzig: Schaefer. 8vo, pp. 391. 3 Thl.), containing short biographical sketches of the "learned authors and artists now living in Saxony," together with lists of their works. Dr. Haan adopts the very desirable plan of admitting magazine articles as well as books. The result is that the volume decidedly increases our respect for Saxon literary activity, at least in its quantitative aspect. The omissions of the book are curious and glaring. One would suppose that the very considerable concentration of the literary life of this little kingdom in two or three neighborhoods would ensure completeness in the compilation. Above all, a fair representation of the labors of the Leipzig University professors was certainly to be expected. We have looked in vain for such well-known names as Credé, Hankel, His, Ludwig, Reclam, G. Wiedemann, Wunderlich, and Zirkel. Ahren's death is not mentioned, though he died at least three months before the very apologetic preface was written. Of Kolbe's continuation of Erdmann's chemical *Journal*, and of Roscher's new history of political economy, the compiler seems quite ignorant. We may have been very unlucky (one looks naturally for familiar names), and these omissions may seem very slight to the theological mind, but they happen to include perhaps the first microscopical geologist, a very noted physiologist, a distinguished professor of clinical medicine (and writer upon thermometry), and the authors of important works or papers on physics, midwifery, and embryology. In fact, the only portion of the book we feel quite sure about consists of the three pages which enumerate the works of the editor himself. From this we learn that he has already displayed considerable compilatory activity—a fact which renders the failures of the present book the less excusable.

## LIVINGSTONE'S LAST JOURNALS.*

IF this large volume is a very interesting book, it is so in spite of a great many drawbacks. It is an enormous mass of raw material, which the author alone could have put into coherent and presentable form. But the author died at his work, in the African forests; and, under the circumstances, it is matter of surprise and gratitude that the record of his labors, imperfect as it is, should have survived him and found its way back to civilization. His African servants, with an admirable instinct of what might be desired of them, preserved every line of his diaries and memoranda, and brought them, with his remains, through an almost heroic journey, back to his starting-point at Zanzibar. His ashes were conveyed to solemn interment in Westminster Abbey, and his journals, on their side, have been buried, as one may almost call it, in this ponderous volume. The editor's work has been simply to decipher and transcribe; selection, arrangement, elucidation, have been left out of the question. The mere task of making out the MS. was often a formidable one; for, in the absence of available writing material, Dr. Livingstone was at times reduced to the most awkward devices—such as scrawling with extemporized ink on old scraps of English newspapers. A fac-simile of a page of this portion of the journal is given by Mr. Waller, with the result of producing an almost equal admiration for the energy which produced and the energy which deciphered it. But it is a question whether the editor might not with advantage have understood his duties in a rather larger way. The advantage would have been greatly that of the general reader if the matter had, in the common phrase, been "boiled down" to half its present bulk. As the work stands, it bears no small analogy to the pathless forest, intersected with large districts of "sponge," through which Livingstone himself had often to pursue his own uncertain way. What has dictated the course actually adopted—that of simply stringing together and printing *verbatim* every line of the material—has been an extreme veneration for the writer's memory. This will be shared by all readers, and certainly a real admirer of Livingstone will be willing to take some little trouble in order to keep pace with him. It may be said, however, that some omissions Mr. Waller might very safely have made. The journal is largely interspersed with religious reflections and ejaculations intended solely for Dr. Livingstone's own use. They are interesting to students of character, for they help to explain the sources of the great explorer's indomitable resolution and patience. He was an ardently sincere missionary, and he believed that he was doing his work with the eye of God constantly upon him. But it seems a rather cruel violation of privacy to shovel these sacred sentences, written in the intensest solitude, into the capacious lap of the public, in common with all sorts of baser matter—including the rather sensational and not particularly valuable illustrations with which the volume is adorned. It is as interesting as it ever was to be admitted behind the scenes of a man's personality, but it is more important than it ever was that the privilege should not be offered to all the world, but reserved for the few who can present a certain definite claim to initiation.

This volume covers a period of something more than seven years. Dr. Livingstone left Zanzibar, on the east African coast, in the month of March, 1866, and he succumbed to exposure and exhaustion on the borders of the great Lake Bangweolo, which he himself had discovered, on the last of April, 1873. He had intended this expedition to be his last, and his hope, shortly before his death, was to finish his work and return home in a year or two more. His work was to establish certain geographical facts which he had left in uncertainty, notably of course the real nature of the sources of the Nile, and to do what missionary work he might in the way of humanizing the natives and mitigating, if he was powerless to arrest, the abominations of the slave-trade. This he regarded as his solemn duty, although evidently it was a duty in the performance of which he took an immense satisfaction. He made sacrifices, he suffered hardship, he performed heroic feats; but the life he found in Africa had become with him a personal passion, and we doubt whether his strong sense of duty would have been capable of making the great sacrifice of remaining quietly in England in the lap of civilization. Incidentally he had such a project as this: "One of my waking dreams is that the legendary tales about Moses coming up into inner Ethiopia with Merr, his foster-mother, and founding a city, which he called in her honor Meroe, may have a substratum of fact. . . . I dream of discovering some monumental relics of Meroe, and, if anything does remain, I pray to be guided thereto. If the sacred chronology would thereby be confirmed, I would not grudge the toil and hardship, hunger and pains, I have endured—the irritable ulcers would only be discipline." Elsewhere he says: "An eager desire to discover any evidence of the great Moses having visited these parts spell-bound me; for if I could bring to light anything to confirm the Sacred Oracles, I would not grudge one whit all the labor expended." During this long period he was wandering hither and thither over an immense region, exploring the basin of the great Lualaba and Chambeze Rivers, and the three great lakes—Nyassa, Bangweolo, and Tanganyika—marching for weeks together through forest and jungle, and living for months in African villages on the same hard allowance as the natives; observing everything, noting everything, suffering everything that exposure and a diet but one degree removed from starvation could subject him to. It seems to the reader a dog's life; but Livingstone had a genius for it, and he broke down only under a terrible accumulation of hardship. The details of his journeyings we have not space to set forth; they imply a constant reference to the very excellent and detailed map which accompanies the work, and a somewhat intimate acquaintance with Living-

* 'The Last Journals of David Livingstone in Central Africa, from 1866 to his Death. Continued by a Narrative of his Last Moments and Sufferings, etc. By Horace Waller, F.R.G.S.' New York: Harper & Brothers. 1875.

stone's previous explorations and those of the other great African travellers —Speke, Grant, Burton, and Baker. The geography of Central Africa has become a department of science by itself, into which, apparently, one must venture only if armed to the teeth, and grasping the standard of some particular theory. The general reader will here find entertainment enough independent of the doctrinal side of the matter.

Dr. Livingstone started with eight attendants, some Asiatics (he had come from Bombay, where he had been making a long visit, and found important furtherance in his schemes), some Africans, and all, save two or three, capricious and untrustworthy. But he prefers his negroes to his Indian Sepoys, and throughout judges the Africans very leniently and hopefully. If he knew them less well, and had not paid so hard for his knowledge, one would be tempted to say that his estimate of them was rather tainted with "sentimentalism." It is very different, for instance, from that of Sir Samuel Baker, in his lately-published 'Ismailïa,' whose evident feeling on the subject is such that there was something almost ludicrously anomalous in the humanitary nature of his expedition. In the second year of his journey, Dr. Livingstone's charity was sorely tested by the desertion of two of his servants, who carried with them, among other precious articles, his only store of medicines. To be without quinine, amid the African malaria, was to stand at a fatal disadvantage. It was only in 1871 that Stanley overtook him, and he was during this long interval fighting, unassisted, a harsh battle with the symptoms which carried him off a year and a half later. In the summer of 1869 he made his way for the first time into the Manyuema country—a region differing in many of its characteristics from those he had hitherto explored. Here he spent more than two years. "It is all," he says, "surpassingly beautiful. Palms crown the highest heights of the mountains, and their gracefully bended fronds wave beautifully in the wind ; and the forests, usually about five miles broad, between groups of villages, are indescribable ; climbers of cable size, in great numbers, are hung among the gigantic trees ; many unknown wild fruits abound, some the size of a child's head, and strange birds and monkeys are everywhere. The soil is excessively rich, and the people, though isolated by old feuds that are never settled, cultivate largely." This paradise is now given over in great measure to the Arab slavers and ivory-traders from the station at Ujiji, on Lake Tanganyika—a gentry who, if they carry commerce in one hand, carry plunder and murder in the other. To the abominations of slavery in this and in other regions, Dr. Livingstone alludes frequently and in terms of deep disgust ; they haunt him, he declares, by day and by night ; they are the "open sore" of the land, crying aloud to heaven to be healed. He speaks of seeing among the enslaved Manyuema a strange disease, which seemed to be literal broken-heartedness. They drooped and pined, but complained of nothing but a pain which they indicated by laying their hands on their hearts—the position they themselves attribute to the heart being higher up. They were not visibly ill, but very soon they succumbed to this pain and died. Here, also, Dr. Livingstone observed the soko, a large monkey, with much analogy with the gorilla, but of a more amiable disposition. The soko, from Dr. Livingstone's account, seems painfully human.

At Ujiji, to which place he made his way back laboriously, in a state of great destitution and exhaustion, he met Mr. Stanley. This episode figures very briefly in his journals, though it was evidently a very welcome one. Naturally, it completely re-equipped him, and the reader really feels a kind of personal relief when he perceives that the exhausted old man obtained some more quinine. Mr. Stanley was with him for upwards of five months, and when Stanley returned to the coast, after having vainly urged him to do likewise, he started to make his way back to Lake Bangweolo. It is not unkind to say that this was the very fanaticism of enterprise, and the interest of the book, from this point to the close, is of a very painful nature. Dr. Livingstone enters a region of apparently eternal rain, and lives in a drenched condition for the following year and a half. His health fails rapidly ; he makes great marches in spite of it, and only gives up the attempt to advance when his hand is too weak to trace the entries in his diary. The story of his death is compiled very successfully from the statements of those two faithful servants who made their weary pilgrimage back to Zanzibar with his remains. They found him on his knees in the attitude of prayer, beside his bed, with life extinct. This was extremely characteristic. Half the interest of this volume will be found in the reflection it offers of his devotion (when we feel we have a right to observe it), his candor, his singleness of purpose and simplicity. The combination of these qualities, with his unshrinking pluck, his extraordinary endurance, his faculty of universal observation, and of what we may call geographical constructiveness, made him of all great travellers one of the very greatest.

## RECORDS OF THE PAST—ASSYRIA AND EGYPT.*

THESE little volumes are the first of a series intended to make the results of recent study and interpretation of Egyptian and Assyrian monuments and records accessible to the general public. Hitherto these results have been so scattered through journals in many languages, and in the transactions of learned societies of various countries, that only scholars, particularly interested in this field of enquiry, have been likely to be well informed as to the progress of decipherment of hieroglyphic or cuneiform texts, or as to the contents of those newly interpreted. These volumes, therefore, answer to a definite need ; some of the best scholars in this department of knowledge contribute to them, and they are edited by Dr. Samuel Birch, the distinguished Egyptologist. He is responsible for the general arrangement of the materials, and his reputation is a guarantee for the accuracy and thoroughness of the work. The contents of the two volumes already issued (a third is just about to appear) are miscellaneous and of various importance and interest, but they are well chosen to illustrate the wide range of time and of subjects covered by the texts already interpreted. But it were greatly to be wished that Dr. Birch had not confined his editorial functions within such narrow limits as he has chosen to establish for himself. "In order," he says, "to render the volume[s] as popular as possible, and make the information afforded as simple as it can be given, the translations are only accompanied by such notes as are absolutely required to explain intelligibly a few of the more obscure passages." But to make the volumes truly popular and most serviceable to all but the special scholar, a different sort of editing is required. The critical and explanatory apparatus accompanying the texts is not only meagre, but is positively insufficient for a full appreciation of their historic and literary importance. Even a good classical scholar and a well-informed student of history would find more information than is given here convenient, while the mere general reader would find it indispensable.

The grounds for adopting a course of such reserve are, probably, in reality, prudential. The Society of Biblical Archæology, of which Dr. Birch is president, does not wish to stir 'burning' questions. But it is no service to the Bible to make the progress of knowledge difficult ; and it is no help to learning to shrink from controversy on doubtful and open matters of critical investigation and interpretation. Controversy may be disagreeable, but it is unavoidable. The Bible must take care of and defend itself against the revelations of hieroglyphs and arrowheads, as it has had to defend itself against the discoveries of geology and the researches of physiology. In future volumes it may be hoped that an attempt at least will be made to give some chronology (however rough or hypothetical) of the different documents printed, some references to the history with which they connect themselves, and some explanations of the allusions made, and the incidents referred to in them. Thus only can the volumes be made "popular."

The main contents of both volumes have greater historical and archæological than literary interest. We have, indeed, long since learned to look for but scanty contributions from either Egypt or Assyria to speculative or imaginative literature. There was little activity of thought among the people of either land. Through the vast period of Egyptian civilization, generation succeeds generation with slight increase of curiosity, with slow development of mental faculty, occupied with interests similar to those of their predecessors, and content with the same forms of expression. The hereditary, fixed conditions of society hindered that independence of the individual of which progress in reasoning and activity of imagination are the result. Literary effort and expression are the sign and proof of a higher stage of personal and social development than either Egypt or Assyria attained. Their people remained occupied throughout the whole period of their greatness with the external conditions of life, and with mere objective matters of thought. The "wisdom of the Egyptians" was not a deep philosophy, but a mingling of childish speculation with the accumulation of knowledge, the invention and the experience of thousands of years of uninterrupted tradition and transmission. Such expression as they required for their sentiments, emotions, and faith, they found in the practical arts of architecture, sculpture, and painting, and even in these there is no progress from step to step of wider or more complete expression of the inner nature. The arts remain external, subjected to rule, uninspired by the effort to express passion or character. The bas-relief is sculptured narrative, the picture is painted description of incident ; very seldom of emotion, never of a complex, realized, mental ideal. These forms of expression were, for

* 'Records of the Past : being English Translations of the Assyrian and Egyptian Monuments. Published under the Sanction of the Society of Biblical Archæology.' Vol. I. Assyrian Texts. Vol. II. Egyptian Texts. London : Samuel Bagster & Sons. 1874. Sm. 8vo, pp. iv. 176 ; pp. x. 176.

the most part, sufficient for the people. Neither in Egypt nor Assyria did the age of poetry arrive. The greater part of the written or inscribed monuments of both peoples consist mainly of records, in various forms, of public events or private affairs; of inscriptions in honor of kings, or hymns and invocations to the gods, or rituals of worship, or calendars and other similar astronomical documents. A few brief pieces of literature proper, showing a mingling of traditional and individual elements, have indeed been preserved.

In the volume before us of translations from Egyptian sources, there are two tales drawn from papyri in the British Museum, one of 'The Two Brothers,' the other of 'The Doomed Prince,' which are of special interest, not merely as indications of Egyptian genius and taste, but as containing —though written perhaps fifteen hundred or two thousand years before our era—resemblances of incident so close to tales familiar through Europe, from Scandinavia to Italy, as to point to an origin still more remote in the dim ages before distinct history begins. And in the Assyrian volume, the piece of most interest is that called 'The Legend of the Desert of Ishtar,' in which we find the earliest known form of a legend universally spread through Asia and Europe, under a hundred different forms and with various meanings, of the descent to Hades or to hell of some divine or human personage. The legend in its Assyrian form, as translated by Mr. Fox Talbot from a tablet in the British Museum, is of such general interest, and is so much the most poetic of the remains of Assyrian antiquity that have yet been disclosed to us, that we make room for a considerable part of it. Ishtar was the goddess of love. The object of her descent into the infernal regions "was probably," says Mr. Talbot, "narrated in another tablet which has not been preserved. I conjecture that she was in search of her beloved Thammuz-Adonis, who was detained in Hades by Persephone." But the object of her descent is of little consequence, so far as the value of the narrative that exists is concerned. Enough remains to illustrate the imaginative spirit of the Assyrians, and to connect us with them by a closer link than any formed out of the sculptured stones and alabaster bas-reliefs of their long-buried palaces.

"To the land of Hades, the region of . . .
Ishtar, daughter of the Moon-god San, turned her mind,
and the daughter of San fixed her mind [to go there]:
to the House of Eternity, the dwelling of the god Irkalla:
to the House men enter—but cannot depart from:
to the Road men go—but cannot return.
The abode of darkness and famine
where Earth is their food: their nourishment Clay:
light is not seen: in darkness they dwell:
ghosts, like birds, flutter their wings there:
on the door and gate-posts the dust lies undisturbed.
When Ishtar arrived at the gate of Hades
to the keeper of the gate a word she spoke:
'O keeper of the entrance! open thy gate!
Open thy gate! again, that I may enter!
If thou openest not thy gate, and I enter not,
I will assault the door: I will break down the gate:
I will attack the entrance; I will split open the portals;
I will raise the dead to be the devourers of the living!
Upon the living the dead shall prey!'*
Then the Porter opened his mouth and spoke,
and said to the great Ishtar:
'Stay, Lady! do not shake down the door!
I will go, and tell this to the Queen Nin-ki-gal.'†
The Porter entered, and said to Nin-ki-gal:
'These curses thy sister Ishtar [utters],‡
blaspheming thee with great curses . . .'
When Nin-ki-gal heard this . . .
she grew pale, like a flower that is cut off:
she trembled, like the stem of a reed.
'I will cure her rage,' she said: 'I will cure her fury:
these curses I will repay to her!
Light up consuming flames! light up blazing straw!
Let her doom be with the husbands who deserted their wives!
Let her doom be with the wives who from their husbands' side departed!
Let her doom be with the youths who led dishonored lives!
Go, Porter, open the gate for her,
but strip her, like others at other times.
The Porter went and opened the gate.
'Enter, Lady of Tiggaba City!‖ It is permitted!
May the Sovereign of Hades rejoice at thy presence!'¶
The first gate admitted her, and stopped her: there was taken off the great crown from her head.
'Keeper! do not take off from me the great crown from my head!'
'Excuse it, Lady! for the Queen of the land commands its removal.'
The second gate admitted her, and stopped her: there were taken off the earrings of her ears.
'Keeper! do not take off from me the earrings of my ears!'
'Excuse it, Lady! for the Queen of the land commands their removal!'
The third gate admitted her, and stopped her: there were taken off the precious stones from her head.
'Keeper! do not take off from me the precious stones from my head!'
'Excuse it, Lady! for the Queen of the land commands their removal!'
The fourth gate admitted her, and stopped her: there were taken off the small lovely gems from her forehead.
'Keeper! do not take off from me the small lovely gems from my forehead!'
'Excuse it, Lady! for the Queen of the land commands their removal!'
The fifth gate admitted her, and stopped her: there were taken off the central girdle of her waist.
'Keeper! do not take off from me the central girdle from my waist!'
'Excuse it, Lady! for the Queen of the land commands its removal.'
The sixth gate admitted her, and stopped her: there were taken off the golden rings of her hands and feet.
'Keeper! do not take off from me the golden rings of my hands and feet!'
'Excuse it, Lady! for the Queen of the land commands their removal!'
The seventh gate admitted her, and stopped her: there was taken off the last garment from her body.
'Keeper! do not take off from me the last garment from my body!'
'Excuse it, Lady! for the Queen of the land commands its removal!'
After that mother Ishtar had descended into Hades
Nin-ki-gal saw her, and stormed on meeting her.
Ishtar lost her reason, and heaped curses upon her.
Nin-ki-gal opened her mouth and spoke,
to Namtar her messenger a command she gave:
'Go, Namtar! [some words lost.]
Bring her out for punishment. . . .'"

The end of this last line is mutilated, and the remaining lines of the first column are imperfect. But we learn from them, and from the second column of the tablet, that Namtar was commanded to afflict Ishtar with dire diseases and torments. The story goes on to relate how, after the goddess of love had been shut up in Hades, the world began to miss and mourn her. The assembly of the gods was summoned, and the sun, weeping, complained of her departure. Then the god Hea laid a plan, and formed the figure of a man of clay, and bade the phantom go to save her, and awe Nin-ki-gal with the names of the great gods. The phantom was successful in his errand, and Nin-ki-gal dismissed the goddess, and the gates, as she passed through them, restored to her her garments and her ornaments.

It is vain to seek for a complete elucidation of the allegory of this ancient poem. But it is better to leave it as a mere story, a work of the imagination, than to distort it into a solar myth, or pervert it into an ethical narrative. We commend these volumes to all classical students, and lovers of the early records of our race.

* This very violent language is evidently introduced by the writer of this legend in order to justify the subsequent wrath of Proserpine.

† Nin-ki-gal answers to the Proserpine of the Latins. Her name means 'goddess of the great region'—*i.e.*, Hades.

‡ The end of this and several following lines is broken off, which makes the translation uncertain.

‖ A principal seat of Ishtar's worship.

¶ These words are evidently ironical.

## THE STUDY OF CHRISTIAN CLASSICS.*

WHILE fashionable educators are devising methods for the apotheosis of mediocrity, incapacity, and indolence, Lafayette College is preparing text-books for the study of the Fathers of the Church! Our readers, however, may be reminded that the study of the early Christian writers was introduced into Harvard more than twelve years ago. Still, it must be confessed that Lafayette, in this respect, is in advance of any other literary institution in the country, inasmuch as the endowment by Benjamin Douglass for the study of the Fathers enables it to employ two professors of "Christian Greek and Latin" (an odd expression, by the way). We only hope that these professors of Christian Greek and Latin are not paid on starvation principles, so familiar to college instructors. "For many centuries," says the notice preceding the title-page of the volume before us, "and down to what is called the Pagan renaissance, they [the writings of the early Christians] were the common linguistic studies of the educated Christians." If by "the Pagan renaissance" the author means "the Reformation," the statement may be said to be essentially correct; for not long after that epoch the Fathers (absurdly regarded as a college of Egyptian priests) began to be attacked by Protestant scholars because they were believed to favor Rome, and because they did not confirm the peculiar doctrines of the Reformers. If Augustine was occasionally well spoken of, it was chiefly because he was thought to agree with Luther and Calvin. "It would seem," says Dr. March, in the preface, "that the study of them [the events] in the admirable language in which they were originally recorded, might help to make our college graduates not only learned in the Greek language, but stout-hearted men, ready to work and suffer for the truth." Nevertheless, the Greek language must be learned from its early authors. The most eminent of the Greek Fathers owed their mental discipline to those authors. "Origen," says Porphyrius, "being a Greek [in religion] and having had a Greek education, adopted a barbaric religion [Christianity] and prostituted his learning to the defence of that religion. He lived like a Christian, but philosophized like a Greek, subjecting the sound teachings of philosophy to foreign myths. His constant companions were Plato, Numenius, Cronius, Apollophanes, and the most distinguished Pythagorean writers." Porphyrius, it must be remembered, was one of the bitterest and ablest opponents Christianity ever had. The inventor of the anecdote that John Chrysostom was in the habit of reading the plays of Aristophanes, evidently believed that popular preaching was intimately connected with comedy.

* 'The Ecclesiastical History of Eusebius. The First Book and Selections. Edited for Schools and Colleges by F. A. March, LL.D. With an Introduction by A. Ballard, D D., Professor of Christian Greek and Latin in Lafayette College; and Explanatory Notes by W. B. Owen, A.M., Adjunct Professor of Christian Greek.' New York: Harper & Brothers.

'Latin Hymns with English Notes, for Use in Schools and Colleges. By F. A. March, LL.D., Professor of Comparative Philology in Lafayette College.' New York: Harper & Brothers. 1874.

The first book of the Ecclesiastical History of Eusebius, followed by selections from some of the other books, forms the second volume of the "Douglass Series." That Eusebius was one of the most prominent ecclesiastics of the first half of the fourth century is proved by the complimentary expression, *the rascally Eusebius*, used by Julian ; and it must be kept in mind that this emperor bestowed such titles only upon persons of much merit ; thus, he applies the epithet *knave* to John the Evangelist and speaks of Paul the Apostle as the *greatest impostor on record*. The faults of Eusebius as a historian are those of omission rather than of commission. His theory seems to be that narratives prejudicial to morality should be suppressed. This is considered a serious error by the curious. Had Eusebius enlivened his history of the church with relishing allusions to the adventures of Agrippina, Messalina, Faustina, and Fausta, it is not absurd to suppose that advanced theologians might be tempted to learn Greek. Our author's 'History,' then, would rival the 'Historia Arcana,' the most interesting portions of which—namely, the performances of the Empress Theodora and the geese—were actually committed to memory (in Greek, of course) and repeated in conversation by an English prelate of the last century.

The text is remarkably free from typographical errors. The notes are intended for students imperfectly acquainted with the grammatical forms and syntax of the language. In a second edition, these notes must be thoroughly revised.

Whether the 'Latin Hymns' can be profitably used in college may be doubted. For our own part, we cannot go as far as the editor of this work : "For inspiring and elevating thought," he says in the preface, "and for vigor, harmony, and simplicity of language, the 'Hymns' are better than any Augustan odes." The thought of the 'Latin Hymns' is indeed often inspiring and elevating. But it is of the modern flavor ; we miss in them that total change of atmosphere which throws a new zest into life ; that contrast of men and manners which is needed if the mind is to be rid of narrow prejudice and onesidedness. As to the other point—the language—men who felt themselves half-inspired might well express themselves with vigor and simplicity. But the vehicle in which the ideas are conveyed is an artificial and conventional one. The words are Latin—most of them. When the Portuguese author of the 'Guide to English Conversation' asks and answers : "Do you understand French language ? She do know me," the words are all pure English, but the sentence is not English. So in the 'Latin Hymns,' though the words are Latin, the combination of words is not Latin. In fact, from the rigid classical point of view, it would be scarcely an exaggeration to call it a kind of pigeon-Latin ; not very much more like Latin than pigeon-English is like English, than cigar-box Spanish is like Castilian

But while we do not consider these hymns suited for the purposes of what a German would call *formale Bildung*, they are an indispensable part of education ; only, instead of confining them to the narrow college world, we should be glad to see them in the hands of all mature men and women of education. Their very modern tone—"so much like English"—with its motley jingle of rhyme, assonance, and accentuation, makes them easy reading for imperfect Latin scholars. Even as mere bits of history they are curious. But especially are they of value as a check on the rank sentimentalism and prettinesses of our modern hymns or "human compositions," as they are called by some theologians.

This collection begins with Hilary, and contains the seven great hymns and most of the familiar ones, one hundred and fifty-one in all : "Veni Creator Spiritus," "Dies Irae," "Stabat Mater," "Cantemus cuncti melodum," etc. The last two hymns in the book are Luther's "Feste Burg," translated by Buttmann, and the "Rock of Ages," by Mr. Gladstone. In the Latin heading of the latter, by the way, there is a slight oversight : "Augustus M. Toplady et W. E. Gladstone." Is not Mr. Gladstone's first name Gulielmus ? There is no accounting for tastes, but to our mind the introduction of these two hymns, and particularly of the latter, mars the general effect. Not but what it is always interesting to see difficulty surmounted by ingenuity. The box made of 11,824 pieces of wood by a convict is interesting ; it is interesting to see Miss Anna Leake, the no-armed lady, deftly embroidering with her toes ; and it is interesting to see Mr. Gladstone (if he has no better way of spending his time) overcoming imperfectly the difficulties of Latin rhyme. But the interest of a real Latin hymn is of a wholly different kind. It must be old, it must be a *vox clamantis in deserto*, as it were the outpourings of one clothed with camel's hair and with a girdle of a skin about his loins. Shift the time and the scenery and bring it down to a concrete live Englishman, who rings for his boots and his shaving-water, the spell vanishes, the imagination refuses to work, and we cry out with the theologians aforesaid : "Enough ! This is a 'human composition.'"

We notice in this volume more misprints in the text : Page 204, line 20 and 25, *Illiuc ;* p. 56, line 10, *juvat ;* p. 20, line 8, *canditatus ;* p. 101, line 19, *fumas ;* p. 32, line 18, *moeror ;* line 23, *ocyus ;* p. 57, line 11, *Occulive*. On the same page, line 25, we are in doubt whether *quaerelis* is intentional or not. Barbarisms quite as bad are certainly found in the Pompeian *graffiti*, for instance, *laesaerit* for *laesĕrit*, *maeae* for *mĕae*, *haberae* for *haberĕ*, etc., not to speak of Schuchardt's unrefreshing lists. But we had not supposed that anybody would now say *coena*, *coelum*, or *coelestis*.

# Fine Arts.

## NOTES ON THE THEATRES.

IF one held the belief that there is any very intimate relation between the stage, as it stands in this country, and the general cause of American civilization, it would be more than our privilege, it would be our duty, as vigilant observers, to keep an attentive eye upon the theatres. For in New York, at least, these establishments have rarely been more active than during the past few weeks, and the moment would be highly opportune for drawing from the national diversions a critic's moral as to the national state of mind. In fact, however, we suspect that moralizing too rigidly here is a waste of ingenuity, inasmuch as the diversions in question are not especially national. New York possesses half-a-dozen theatres of the so-called first class, in addition to a host of play-houses of the baser sort, whose performances are dramatic only by that extension of the term under which the romances in the Sunday papers may be spoken of as literary. These theatres are all, for the time, working at high pressure. Each has brought forward its *pièce de résistance*. The trumpets are blown and the public is convoked. The public assembles in varying numbers—on the whole, it seems to us, in very goodly ones. The public evidently likes play-going, and is willing to pay for it—to pay a good deal, and to pay often. But except at the Fifth Avenue Theatre, it does not go with the expectation of seeing the mirror held up to nature as it knows nature—of seeing a reflection of its actual, local, immediate physiognomy. The mirror, as the theatres show it, has the image already stamped upon it—an Irish image, a French image, an English image. The French and English images indeed are multiplied, and an Italian image, we perceive, looms above the horizon. The images may be true to an original or not ; the public doesn't care. It has gone to look and listen, to laugh and cry—not to think. This is so true that we fancy it must have resented even the very slight intellectual effort necessary for finding "Women of the Day" at the Fifth Avenue as preposterous an attempt to portray as it was a dreary attempt to entertain. Nevertheless, if the theatre with us *is* a superficial institution, it shares the peculiarity with other social phenomena, and the observer may commit as great a fault in taking it too easily as in taking it too hard.

Our drama seems fated, when it repairs to foreign parts for its types, to seek them first of all in the land of brogue and "bulls." A cynic might say that it is our privilege to see Irish types enough in the sacred glow of our domestic hearths, and that it is therefore rather cruel to condemn us to find them so inveterately in that consoling glamour of the footlights. But it is true that an Irish drama is always agreeably exciting ; whether on account of an inherent property in the material, or because it is generally written by Mr. Boucicault, we are unable to say. "The Shaughraun" will, we suppose, have been the theatrical event of the season ; and if a play was to run for four or five months there might have been a much worse one for the purpose than this. There is no particular writing in it, but there is an infinite amount of acting, of scene-shifting, and of liveliness generally ; and all this goes on to the tune of the finest feelings possible. Love, devotion, self-sacrifice, humble but heroic bravery, and brimming Irish *bonhomie* and irony, are the chords that are touched, and all for five liberal acts, with a great deal of very clever landscape painting in the background, and with Mr. Boucicault, Mr. Montagu, Mr. Becket, and Miss Dyas in the foreground. For Mr. Boucicault, both as author and actor, it is a great triumph—especially as actor. His skill and shrewdness in knocking together effective situations and spinning lively dialogue are certainly commendable ; but his acting is simply exquisite. One is hard cleverness, polished and flexible with use ; the other is very like genius. The character of the Shaughraun is very happily fancied, but the best of the entertainment is to see the fancy that produced it still nightly playing with it. One hears it said sometimes that an actor acts with "authority" ; certainly there is rarely a higher degree of authority than this. Mr. Boucicault smiles too much, we think ; he rather overdoes the softness, the amiability, the innocence of his hero ; but these exaggerations perhaps only deepen the charm of his rendering ; for it was

his happy thought to devise a figure which should absolutely, consummately, and irresistibly please. It has pleased mightily.

"The Two Orphans" at the Union Square Theatre, a piece which has been running a race with the "Shaughraun" in popularity, is an American rendering of an elaborate French *drame* of the old "boulevard" school. The original play ran all last winter in Paris, and fairly rejuvenated the rather defunct type to which it belonged. It is prodigiously clever, and we doubt whether for the time and the money one spends it would be possible to give one fuller measure, pressed down and running over, of surprises, sensations, and bewilderments. What is offered at the Union Square is the mere gaunt, angular skeleton of the original. The whole thing, both as to adaptation and rendering, is very brutally done. It hangs together as it can. There is no really delicate acting in the piece, with the exception, in a sense, of Miss Kate Claxton's representation of the blind maiden. She goes through the part with the pretty dismalness required, and with the enunciation of a young lady reciting a "piece" at a boarding-school. But "The Two Orphans" is worth seeing simply for the sake of sitting in one's place and feeling the quality of a couple of good old-fashioned *coups de théâtre* as your French playwright who really knows his business manages them. The first is when one of the Orphans, hearing in her garret the voice of the other, who is wandering in the street, sightless and helpless, and singing a song addressed, through the mercy of chance, to her sister's ear, and being about to fly to her rescue, is arrested on her threshold by a *lettre de cachet*. The other is the cry of that sadly unwholesome cripple, Pierre (badly played, we should say, if the part were not in its nature an impossible one), when, after being trampled upon through the whole play, he turns upon his hulking, blackguard brother: "As you say yourself, we come of a race that kills!" These are very telling strokes, but if you wait for them at the Union Square you pay for them well. You are kept in patience, it is true, by some very pretty scenery.

The Fifth Avenue Theatre, we believe, makes a specialty of "American comedy," eschews for the time at least Parisian orphans and heroic bog-trotters, and gives us our fellow-citizens in their habits as they live. Some one ought to be held morally accountable for such an unqualifiable mess of vulgarity as "Women of the Day." It is a pity to talk about this thing, even explicitly to pass it by; but we believe it is one of a series, and under these circumstances one strikes out instinctively in self-defence. It was ghastly, monstrous, a positive nightmare. It ran for several weeks, and one wonders whether the public was an active or a merely passive accomplice. Did it like it, or did it simply endure it? The public at large is very ignorant and very good-natured, and anything is possible.

One is bound to regret, in the presence of such a phenomenon as "Women of the Day," that the wholesome old fashion of hissing has in the English theatre fallen into disuse. It was of course liable to abuse; but what is one to say, on the other hand, of the spectator's patience? It would seem at least that, short of the privilege of absolute hissing (which ceases to be brutal only when it is directed at the play, and not at the performers), the disappointed, the deceived spectator ought to hold in his hand some instrument of respectful but uncompromising disapproval. We made this reflection as we watched the celebrated Mrs. Rousby, who has been interpreting historic blank-verse for a month at the Lyceum. It is hard to speak rigidly of so handsome a woman, but Mrs. Rousby's histrionic powers are about equivalent to those of some pretty trained animal—a pet lamb, say, or a white rabbit, or a snowy-breasted dove. Her acting is absolutely flat and weak—uninspired, untrained, unfinished. It was singular to see so extremely pretty a person take so little the critical chill off the atmosphere. Mrs. Rousby is distinctly incompetent. She has been followed at the same theatre by another English artist, a real artist this time—Mr. Toole. Mr. Toole has solved the problem of making low comedy charming. It must be admitted that in one of his parts—the "Artful Dodger"—the lowness is more apparent than the charm.

A more important dramatic enterprise than any we have mentioned has been the revival at Booth's Theatre, as a great spectacle, of "Henry V." We can spare but a word to it. The play could be presented only as a kind of animated panorama, for it offers but the slenderest opportunities for acting. These all fall to the lot of Mr. George Rignold, a young English actor, who, as the victor of Agincourt, has made a very charming impression. He plays the part in the most natural fashion, looks it and wears it to perfection, and declaims its swelling harangues with admirable vigor and taste. He is worth looking at and listening to. The scenic splendors of the play have received many compliments, though, as such things go, they seem to us to have a number of weak spots. But even if they had fewer, they would still, to our sense, be founded on a fallacy. Illusion, as such an enterprise proposes to produce it, is absolutely beyond the compass of the stage. The compromise with verisimilitude is not materially slighter than in the simple days before "revivals" had come into fashion. To assent to this you have only to look at the grotesqueness of the hobby-horses on the field of Agincourt and at the uncovered rear of King Harry's troops, when they have occasion to retire under range of your opera-glass. We approve by all means of scenic splendors, but we would draw the line at invading armies. Mr. Rignold, as we say, however, really produces a very grateful illusion.

JUST PUBLISHED.

*Lectures on the Early History of Institutions.*

By SIR HENRY SUMNER MAINE,

Corpus Professor of Jurisprudence in the University of Oxford

8vo, cloth, $3.

## *The Reader.*

MICHELET'S 'SUMMARY OF HISTORY,' IN ENGLISH.—'THE STATESMAN'S YEAR-BOOK' FOR 1875.—THE LIFE OF BISHOP PATTESON.

It is hard to say by which of his many works posterity will most clearly remember the late M. Jules Michelet; but every consideration points to his 'Outlines of Modern History to the French Revolution,' as one of his best-conceived efforts, and perhaps the most faultless and most serviceable of them all. In this summary the poet-philosopher of 'The Sea,' 'The Mountain,' and 'The Bird,' has been compelled by the exigencies of the task to chasten his style, and to restrain the exuberance of fancy which, while delicate and graceful in the extreme, is to foreign ears a little beside the question. His condensed History, being written for the young, and as a manual of instruction, is not extended by one superfluous word; it escapes entirely the tendency to ornament, which may be called M. Michelet's besetting virtue. With the clearest method, and with that concentrated view of history as a philosophic argument which M. Michelet learned from his favorite predecessor, the Neapolitan Vico, his narrative compactly flows, setting events in their clearest mutual relation, and making the whole development of Europe a tableau which may be compassed by one sustained effort of the memory. Yet while the author thus turns the reversed lorgnette on the course of civilization, he contrives to introduce those graces of style, those apposite reflections, and even those proverbial, ringing phrases of famous people, which are history's lessons; in this he uses a liberty which is the peculiar skill of the French; for it is the gift of his nation to condense most logically, and yet to avoid dryness most successfully—to know where to concentrate and where to dwell. These felicities of style, belonging to a gifted people and a gifted individual, are particularly the endowment of Michelet's Historical Summary, making it in many respects a better manual for English instruction than works prepared in English. A version has been carefully made by an experienced translator, Mrs. M. C. M. Simpson, and continued with considerable skill to the present period.

'The Statesman's Year-Book,' for 1875, just issued by Macmillan & Co., is a welcome addition to an invaluable series. While every Power in Europe, like a warrior looking to the buckles of his harness, is engaged in military revision, a book which is an impartial authority on the numerical force of the armies and navies of the globe is a useful friend to all who watch the current of events. 'The Year-Book' also tells the civil strength and commercial importance of every nation, and adds many of those facts about the governing families of the world which make the 'Almanach Botta' so dear to court gossipers. The Number for 1875 is prepared by the old editor, who has so distinguished himself previously for knowledge and impartiality, Mr. Frederick Martin; and the work, in the twelfth year of its existence, is still more complete, omniscient and useful than before. The lists of authorities given, both official and non-official, form a bibliography of the greatest convenience and interest.

'The Story of a Fellow-Soldier,' a memorial of one of the most heroic lives of the century, by Frances Awdry, is so beautiful in its subject and so simply told as to be irresistible. It is adapted for a young audience, but mature readers would have cause of just complaint if they were excluded. The subject is the Rev. John Coleridge Patteson, son of the eminent Judge Sir John Patteson, and Christian apostle and missionary Bishop in the South Seas. This gentleman added a genius for labor and organization peculiarly English to the fervor and purity of the primitive Oriental propagators of Christianity. He passed from island to island of the Melanesian group, often lifting up his hand between warring tribes, intent only on adding souls to his treasury of spiritual jewels, and gradually controlling the respect of all. His comprehension of the rude, primitive natures among which he worked was an instinct, improved by experience until at last he seems to have been accepted as arbitrator and friend among the most savage tribes. The story of his career recounts many adventures as strange as the wildest of St. Paul's. Whether he bears his charmed life into the haunts of the rude turtle-hunters, or climbs the palms to the human nest-habitations, ninety feet high, of Ysabel Island, or sets up schools among the islanders from Pitcairn, or adopts a child of the cannibal glutton Bula, chief of Nengone; wherever he goes he penetrates like civilization and goodness in person. At length, as such a life should, the existence of Bishop Patteson ends in the beauty of martyrdom. After Christianizing many natives, introducing monogamy, and making a prosperous school out of the ship in which he cruised, he was killed by the savages of Napaku, in 1870, in retaliation for five murders committed by white sailors. Such a history makes us proud of our Anglo-Saxon race, and confident of the future of Christianity.

### HISTORICAL WORKS.

*A SUMMARY OF MODERN HISTORY.* Translated from the French of M. Michelet, and continued to the present time, by M. C. M. Simpson, translator of 'Memoir and Remains of De Tocqueville,' etc. Extra fcap. 8vo, $1 75.

*L. VON RANKE'S HISTORY OF* England, principally in the Seventeenth Century. Translated from the German. 6 vols. 8vo, $24.

*A SHORT HISTORY OF THE ENGLISH PEOPLE.* By J. R. Green, M.A., Examiner in the School of Modern History at Oxford. With Chronological and Genealogical Tables and Colored Maps. Cr. 8vo, $2.

"To say that Mr. Green's book is better than those which have preceded it would be to convey a very inadequate impression of its merits. It stands alone as the one general history of the country for the sake of which all others, if young and old are wise, will be speedily and surely set aside."—*Mr. S. R. Gardiner in the Academy.*

"Mr. Green's book seems to me not only the best English history of its size and plan, but really the most satisfactory of all histories of England we have, giving the most complete and vivid account of the growth of the English nation, and the development of its literature and character, as well of its political institutions."—*James Bryce, D.C.L., Regius Professor of Civil Law at Oxford.*

*THE CONSTITUTIONAL HISTORY* of England, in its Origin and Development. By William Stubbs, M.A., Regius Professor of Modern History at Oxford. Vol. I. Crown 8vo, pp. 638, $4 50.

"Professor Stubbs has long been known to be one of the highest living authorities on English history, and his book will not disappoint the high expectations of his friends. Many of its merits are patent on its face. It is filled with a mass of information rarely to be found in the pages of any English writer. The learning which is manifest in every line is not the erudition of a pedant, but the well-digested information of a man who has devoted the whole powers of his mind to a great subject worthy of study, and attempts to communicate within a moderate space some portion of the facts with which his memory is stored."—*The Nation, March 4.*

*SELECT CHARTERS AND OTHER* Historical Documents, Illustrative of the Constitutional History of the English Nation from the Earliest Times to the Reign of Edward I. Edited by W. Stubbs, M.A., Regius Professor of Modern History at Oxford. Crown 8vo, $3 50.

*THE HISTORY OF THE NORMAN* Conquest of England, its Causes and Results. By Edward A. Freeman, M.A., Hon. D.C.L., LL.D., etc., late Fellow of Trinity College, Oxford. American edition, revised by the Author, with all the Maps and Plans of Battles. Vols. I. to IV. 8vo, cloth, $16.

"A history in which vast and varied learning is combined with indomitable patience, scrupulous accuracy, great literary skill, a fine historical style, and a fire of eloquent enthusiasm, which abundantly justify our estimate of the first volume, that it is by far the greatest history of our day."—*British Quarterly Review.*

*THE GROWTH OF THE ENGLISH* Constitution, from the Earliest Times. By E. A. Freeman, M.A., etc. Second edition. Crown 8vo, $2.

*OLD ENGLISH HISTORY.* By E. A. Freeman. With five Colored Maps. Extra fcap. 8vo, half bound, $1 75.

"One of the most admirable books—it is not excessive flattery to say altogether *the* best book—of its kind in the language; and if any other language can boast its equal, its existence has not yet been properly made known."—*North American Review.*

*CAMEOS FROM ENGLISH HISTORY.* By Charlotte M. Yonge, author of the 'Heir of Redclyffe.' Two Series. Extra fcap. 8vo, each $1 75.

*THE HOLY ROMAN EMPIRE.* By James Bryce, D.C.L., Regius Professor of Civil Law at Oxford. New edition, with Supplementary Chapter on the 'New German Empire.' Crown 8vo, $3.

*SCANDINAVIAN HISTORY.* By E. C. Otté. With Maps. Globe 8vo, cloth, $2 50.

*EUROPEAN HISTORY,* narrated in a Series of Historical Selections from the best authorities. Edited and arranged by E. M. Sewell and C. M. Yonge, author of the 'Heir of Redclyffe.' Two vols. crown 8vo, each $1 75.

*A HISTORY OF THE CHRISTIAN* Church. Middle Age. From Gregory the Great to the Excommunication of Luther. By the Ven. Archdeacon Hardwick. M.A. Third edition. Edited by Prof. W. Stubbs, M.A. Crown 8vo, $3.

*A HISTORY OF THE CHRISTIAN* Church during the Reformation. By the Ven. Archdeacon Hardwick. Third edition. Revised by Prof. Stubbs. Crown 8vo, $3.

*HISTORY OF FRANCE DOWN TO* the year 1453. By G. W. Kitchin, M.A. With Maps. Crown 8vo, $5.

*A PARALLEL HISTORY OF* France and England, consisting of Outlines and Dates. By C. M. Yonge, author of the 'Heir of Redclyffe. Oblong 4to, half bound, $1 25.

*HISTORY OF FEDERAL GOVERNMENT.* By E. A. Freeman, M.A., etc. Vol. I. General Introduction, History of the Greek Federations. 8vo, $6.

### NEW BOOKS.

*THE STATESMAN'S YEAR-BOOK* for 1875. (Twelfth Annual Publication.) A Statistical and Historical Annual of the States of the Civilized World. Hand-book for Politicians and Merchants. By Frederick Martin. Crown 8vo, $3 50.

*PRIMER OF ENGLISH GRAMMAR.* By the Rev. R. Morris, LL.D., President of the Philological Society, author of 'Historical Outlines of English Accidence.' 18mo, cloth, 40 cents; paper cover, 30 cents. (Being the first volume of a new series of history and Literature Primers. Edited by J. R. Green, M.A.)

*THE STORY OF A FELLOW-SOLDIER.* By Frances Awdry. Globe 8vo, cloth, elegant, $1 50.

*LIFE AND LETTERS OF BISHOP* Patteson. By C. M. Yonge, author of 'The Heir of Redclyffe.' Third and cheaper edition, with two portraits. Crown 8vo, 2 vols, $5.

*THE CHRISTIAN CALLING.* By the Rev. J. Llewelyn Davies, Rector of Christ's Church, St. Marylebone, London. Extra fcp. 8vo, $1 75.

*A GENERAL SURVEY OF THE* History of the Canon of the New Testament. By Brooke Foss Westcott, D.D., Regius Professor of Divinity, and late Fellow of Trinity College, Cambridge. Fourth edition, with a new preface. Crown 8vo, $3 50.

*BRITISH WILD FLOWERS,* Considered in Relation to Insects. By Sir John Lubbock, Bart., M.P., F.R.S. With numerous illustrations. Crown 8vo, $1 50. [Nature Series.

"This title should not be allowed to convey the impression that the usefulness of the book is restricted to the limits of Great Britain. In one sense it is correct, for the author has taken his illustrations exclusively almost from British flowers; but the subject is one of world-wide interest, for it opens up an almost unlimited field for the investigation of the biologist and botanist everywhere, and nowhere more emphatically than in America."—*N. Y. Times.*

*THE THREE DEVILS*—Luther's, Milton's, Goethe's. With Other Essays. By David Masson, M.A., LL.D., Professor of Rhetoric and English Literature in the University of Edinburgh. Crown 8vo, $1 75.

*THE METHODS OF ETHICS.* By Henry Sidgwick, M.A., late Fellow of Trinity College, Cambridge. 8vo, $4.

"This excellent and very welcome volume."—*Athenæum.*

*A RAMBLE ROUND THE WORLD.* By M. le Baron de Hübner. Translated by Lady Herbert. 12mo, cloth, extra, $2 50.

"One of the most interesting books of travel of the past year."—*Atlantic Monthly.*

*EGYPTIAN SEPULCHRES AND* Syrian Shrines. Including a visit to Palmyra. By Emily A. Beaufort (Viscountess Strangford), author of 'The Eastern Shores of the Adriatic.' Crown 8vo, $2 50.

### THE NEW NOVEL.

*THE HARBOUR BAR.* A Tale of Scottish Life. 12mo, paper, $1.

"The author has many of the qualifications of a novelist. A keen eye for the picturesque and a power of close observation are indicated in this very life-like picture of fisher-life on the northeast coast of Scotland."—*Athenæum.*

"Upon the working out of Elsie's character the author has expended the more labor, and with good results, too, for rarely in fiction is there to be met with a more perfectly finished picture of a true-hearted, unselfish woman. The description of the terrible catastrophe of the storm on the Harbour Bar is perfect in its graphic vigor and intensity."—*London Morning Post.*

*GOVINDA SAMANTA;* or, The History of a Bengal Raiyat. By the Rev. Lal Behari Day, Chensurah, Bengal. 12mo, paper, $1.

"The book presents a careful, minute, and well-drawn picture of Hindoo peasant life."—*London Daily News.*

"In one respect it is a striking and valuable work. It presents the best and truest picture we possess of the life of the poor agricultural laborer of Bengal. . . . Unique in its way, a simple narrative, wonderfully complete, and intensely realistic."—*Athenæum.*

*FOR THE KING'S DUES.* By Agnes Macdonnell, author of 'Martin's Vineyard,' 12mo, $1.

*** Macmillan & Co.'s Complete Classified Catalogue, by mail, for 6 cents.

# The Nation.

*NEW YORK, THURSDAY, MARCH 18, 1875.*

## The Week.

THE election in New Hampshire was remarkable, not so much for the closeness of the vote, which has thrown the choice of a governor into the hands of the legislature, and thus given it to the Republicans, as for the size of the vote cast. It was one of the largest votes ever cast in the State. In the House, the Republicans have a majority of half-a-dozen, while the Senate is almost, if not quite, evenly divided, and the Council contains three Democrats and two Republicans. The votes for each of the candidates for governor exceed 39,000, and are within a hundred of each other. The Prohibition vote was only 800 this year, falling off largely from last year through defection to the Republican ranks.

There is continued improvement in business, the unfavorable weather being the only important drawback. There has been a buoyant market for breadstuffs and provisions, and the gratifying feature of the situation is that prices have advanced because of the export demand rather than on account of speculation. The rise in the price of wheat will bring to market a vast amount, it being estimated that in the four States of Wisconsin, Iowa, Minnesota, and Nebraska there is a stock of about 52,000,000 bushels. Corn and oats have both been high during the winter; the low price of wheat has kept it in the hands of the farmers; and the extent to which they have been able to get along without selling shows that as a class they are in easy circumstances. Trade with the Northwest ought to be good this spring, as well as safe, and the same is true in regard to other sections of the West. The receipts of cotton continue small, and thus far the crop has been a disappointment; but political troubles have more to do with the unsatisfactory condition of the Southern trade than has even the cotton crop. The outlook in regard to trade, taking the country together, is good, and the jobbers have done a better business during the past week than in any week this year. Credits are granted with caution, and collections are excellent. In Wall Street there has been a spirited speculation in shares and an advance in investments. The "gold clique" have made a demonstration against bank-reserves, and, by locking up gold, have forced up the rates to ½ to ⅝ of 1 per cent. for the use of gold a day. This so far unsettled the foreign exchanges as to lower rates for sterling bills to the point at which gold can be profitably imported from Europe.

Secretary Bristow surprised the Syndicate by including in his call for $30,000,000 five-twenties only $6,000,000 registered bonds, or all that remained uncalled of the issue of 1862. This call, which appeared on Thursday, was foreshadowed by semi-official notice on the preceding Monday, when it was given out, on the authority of the Syndicate bankers, and confirmed as late as Wednesday afternoon by Assistant-Secretary Conant, then in New York, that the call would be confined to registered bonds. It seems clear that such was Mr. Bristow's purpose, and that in it he was sustained by the President. The national banks, the largest holders of registered bonds, raised a great outcry at the proposed discrimination against their investments, and they were joined by other but less influential corporations. There is no reason to believe that Mr. Bristow was influenced by their clamor any more than he was by the pressure of the Syndicate bankers, who would, had none but registered bonds been called, have gained the advantage of a home market for a large amount of new fives, and have been benefited by the increased supply of gold in the market, of which it is understood they were "short." The real reason, and the one given, for the change was that Mr. Bristow doubted whether, under the law, he had the right to call bonds out of their numbered order, and, being extremely cautious, was not disposed, in so important a matter, to take any risk. It is known that it was intended to insert a clause in the Appropriation Bill which passed March 3, specially authorizing the Secretary to call *any* of the five-twenty bonds during the present fiscal year. Whether this clause was incorporated in the bill is not certainly known, nor, if it was, whether it was so expressed as to secure the purpose for which it was designed.

Mr. Caleb Cushing has succeeded in making a settlement of the *Virginius* difficulty very creditable to himself and to Mr. Fish as negotiators. It will be remembered that Attorney-General Williams got the country into a very remarkable position with regard to the vessel herself, by taking the ground that the gist of the outrage consisted in the insult offered to the American flag—there being really no American flag in the case at all, but a piece of bunting which might as well have been that of the United Netherlands or the Achaian League. The Government was compelled to withdraw from this position and formally abandon all claim to the salute which was to have been fired by Spain as a *solatium*, and we should have had to give up the vessel herself had she not fortunately gone to the bottom on her way from Cuba. This was probably the luckiest thing that could have happened, for it left, as the only thing unsettled, the real outrage, the massacre of the prisoners; and apparently the advice of the Attorney-General has not been asked on this head. Spain has now agreed to pay the United States $80,000 in coin in full satisfaction of this claim, the money to be distributed by the President among the families of the killed, or those otherwise interested, without our being obliged to give any account of the distribution to Spain. This differs from the English settlement, both in the amount to be paid—which in the English case was £500 for each white man and £300 for each colored man; in all, £7,700—and in the stipulation that no account shall be required.

Mr. Henry Wilson has written a letter on the Bounty Bill vetoed by the President, in which he says that all the estimates made by the enemies of the bill as to the amounts required under it have been erroneous. He says that it would not have required more than $10,000,000 or $12,000,000 during the first two years, nor more than $63,000,000 in all. Some of its friends estimated it at $29,000,000, the Second Auditor of the Treasury at $59,000,000, the Paymaster-General at $100,000,000, and we have seen another hostile calculation which put it as high as $387,000,000. Mr. Wilson says that he does not regret voting for the bill, but he does not give any reason why the public should regret its failure to pass. Among other reasons for advocating it, he mentions the fact that "the pay and bounty when promised [in the early part of the war] were at gold rates, when the currency was at par, and when paid was not worth more than fifty cents on the dollar"; and at the end of his letter he intimates that while he regards the bonded debt of the country as sacred, he cannot forget that "when the nation promised the soldier his bounty, currency was at par, but when it was paid it was worth less than sixty cents on the dollar; while bonds bought with this money are now worth more than their face value in coin." Nevertheless, until some agreement can be arrived at as to how much money is needed to make the bounties equal, and until it is proved that the $60,000,000 taken out of the Treasury under the law of 1866 has not equalized them, it seems hardly worth while to pass any new enactments.

There have been rumors during the week of Mr. Schenck's recall from London; and many people supposed that the 'Manual of Draw Poker' had probably done for him what his connection with

the Emma Mine had failed to do. But they have, within the last day or two, been boldly if not authoritatively contradicted. It may be said, judging from experience, that there is little or no chance of his retirement as long as he is the object of attack in the press, no matter of what offences he may be guilty. No scandal or misdemeanor, in fact, seems so formidable to the Administration as the appearance of yielding to "newspaper clamor." This was very fully demonstrated in Richardson's case, and he would probably have been retained to this day in any other office than the Treasury. But, we must say, we see nothing in the poker manual which will ruin a man who has served with impunity as director and trustee of the Emma Mine. We venture to assert that Mr. Schenck will not come home at present, and that there are members of the President's circle who would chuckle if they heard that our Minister in London had taught the British aristocracy to play poker and then "cleaned them out." We must not look in that quarter for great moral sensitiveness, or much patriotic pride on the moral side.

---

Mr. Christiancy has marked his entrance to the Senate by an able speech, which he read, on the ground that he had in his eighteen years on the bench in Michigan lost the habit of extemporaneous oratory. His subject was Pinchback and the Louisiana question, in which he touched the root of the difficulty admirably by saying the President was not bound to recognize a *de facto* government (Kellogg) which he had himself set up. This is the exact truth of the matter. Kellogg and his legislature were thrust into power by the United States troops, acting under the orders of the marshal, who did the canvassing himself. These facts, which occurred two years ago, have been conveniently overlooked by the Administration side in the late discussions, and a great deal of sympathy, which might have been turned to better account, has been expended on the President because he had Kellogg on his hands and the wicked Congress refused to take the responsibility of him. The fact is that Kellogg is the President's creature and that of the faithful Mr. Williams, and the complaints which have come from them both about having to "carry" Kellogg, as the slang phrase now runs, ought to be jocose in order not to be something more offensive. Mr. Christiancy's exposition was very distressing to Messrs. Boutwell and Logan, who both concluded that the rash man had gone over to the Democrats. Mr. Boutwell takes a very dark view indeed of the situation, and expects, it is said, another bloody war, as does his friend Butler. They, like many other statesmen, are probably asking themselves what will become of them if the country should settle down into peace and legality.

---

We hope that the "gag-law" may before long get before the Supreme Court, and that an authoritative announcement of the law of libel, as it affects newspaper correspondents, be given. The Buell case has been decided by Judge Treat, but the decision, as given in the newspapers, leaves the question still open. Buell was a Washington correspondent of the Detroit *Free Press*, and sent a despatch regarding Senator Chandler for which he was indicted by the Grand Jury of the District of Columbia Criminal Court, and he having, meantime, gone out of the District, the question arose whether he could, under the "gag-law," be brought back. Buell was arrested on a warrant issued by a United States Commissioner in St. Louis, and the case came before Judge Treat of the United States District Court. The Judge has apparently decided what has always been very clear—that the "gag-law" had no application to such cases; but the matter went off on a flaw in the indictment, which alleged that the libel was "composed" in the District of Columbia, and that it was "published" in Michigan. The place of publication, and not of composition, being the critical thing, the indictment was ruled defective. During the proceedings, however, it was intimated in court that the Attorney-General had devised a new way of getting hold of offending editors and correspondents by means of a "bench-warrant" issued by the Supreme Court of the United States; and that this instrument, which promises to be of as general usefulness as a "writ of assistance" promised to be in New York a few years ago, will hold the offender in spite of any writ of habeas corpus issued by an inferior court. This may seem too monstrous for belief; but after the arrest of the editor of the *Tribune* while subpœnaed before a committee of Congress as a witness, we do not know what to expect.

---

The proceedings of the "Honorable William S. King," member of Congress from Minnesota, to which we called attention some weeks ago, are still highly entertaining. He refused, our readers may remember, to appear before the Congressional Committee on the Pacific Mail enquiry, to tell what he had done with a large amount of alleged corruption-money which was traced to his possession. The Minnesota Legislature in vain besought him by resolution to turn up and save the "escutcheon of the State" from being stained. Far from complying, he took refuge on a stock-farm in Northern Canada, on the edge of the Arctic wilderness, carrying the escutcheon of the State with him, and was there "staining" it at his leisure, when he was, to his great surprise, discovered by the Sergeant-at-Arms, who served a summons on him, at which the Honorable William only laughed. As soon as Congress adjourned, however, he reappeared at Washington, where his first act was to demand from Mr. Jewell the dismissal of the postmaster at Minneapolis. This was, however, carrying his peculiar vein of impudence a little too far, and in spite of the abolition of civil-service reform, his request was refused. Now, there are two considerations of some moment suggested by Mr. King's career. One is, that here is a man who has been a good while in politics, widely known, and thoroughly appreciated, who held the office of postmaster to the House in the Forty-second Congress we believe, and has just been elected to the Forty-fourth Congress, and who, when accused on strong evidence of complicity in gross corruption and malversation of funds, absconds, and is amused by the call of his constituents that he should appear, and in fact displays just as much contempt for public opinion and for the law as any thief who is now hiding from the police in this city. The other is, that, although this man's words and manners are undoubtedly those of a large and growing school of politicians, there are a great number of respectable people to be found who join with them in spreading the belief that it is the newspapers that make American public life look so dark, and that if it was not for the lies and vituperation of reporters, our public men would be held in greater respect. We are shocked by King's tricks, and startled when he demands his share of the "patronage" on his return from his concealment; but King is the product of a state of things which the press has not created, and, in our belief, has not half exposed.

---

We have at last an "American Cardinal" in the person of Archbishop McCloskey, who was raised to the dignity on Monday with Archbishop Manning and Archbishop Ledochowski, who has been having so much trouble with the German Government. But these three foreign appointments were all but counterbalanced by those of two Italian Monsignori—Giannelli and Bartolini; and there are to be five other Italian cardinals appointed, so that the Italian element will still continue to dominate in the Conclave. This was a necessity, perhaps, before the recent improvements in the means of communication; but it has now become an abuse of which foreign Catholics are growing more and more impatient. The most interesting feature in the matter for anybody outside the Catholic Church is that it creates the possibility of a participation of a representative of the United States in the next Papal election, at which so many new influences will come into play. One of the points on which public curiosity will be aroused will be the willingness or ability of France, Austria, and Spain to use their ancient right of "exclusion"—that is, of ruling out, each, one cardinal from the competition. The relations of all these powers to the Holy See have greatly changed since the accession of Pius IX., and it

may be that, in spite of Bismarck's instigation, they will attempt no interference.

---

The Wisconsin Legislature has modified the "Potter Law" so as to allow the railroads to earn a little more money, but has not changed the principle of the act. The Commissioners who have been investigating the railroad problem during the past year have recently made their report, which, though containing a great deal of statistical information of one kind and another, is so obviously the result of "cramming" that it can hardly be said to be an addition of any great importance to railroad literature. The Commissioners submit to the people of Wisconsin the following conclusions: That the only form of railway control likely to prove successful, "under present conditions," is "the legislative, supplemented by direct supervision" (by a commission); that this method requires, first, a determination of the cash value of all the roads; second, an annual determination of the earnings; third, a division of the roads into two classes, the first class embracing roads paying a "reasonable" compensation or valuation—second, all other roads; fourth, a maximum of rates, subject to legislative revision, for the first class; fifth, no restriction of rates for the second class, except in cases of unjust discriminations; sixth, prohibition of discrimination and extortion, cases to be tried by the commission; seventh, additional police regulations; eighth, power on the part of the commission to require repairs and improvements; ninth, publicity of rates; tenth, publicity of contracts; eleventh, uniform and full accounts; twelfth and thirteenth, efficient means for enforcement of the laws. With regard to the actual condition of the Wisconsin roads, the Commissioners find that there are only two companies which come near raising an adequate income on their cost; one of them, the iniquitous St. Paul Company, the Commissioners are inclined to think earns the enormous income of 7 per cent. on its Wisconsin lines, though its net earnings are 4.67 per cent. on the cost of the whole road, as reported by the Company, while its balance, after paying interest on its bonds, is 2.21 per cent.

---

The Grangers' year in Minnesota has given the Commissioners of that State food for deeper reflection than it has the Board in Wisconsin. They found that there were in Minnesota 1,900 miles of railroad, with a stock of $31,000,000, and a funded debt of $86,000,000 and a floating debt of $6,000,000. The stock and debt together amounted to the comfortable figure of $52,000 a mile, the working expenses were sixty-nine per cent., and the net earnings $1,894,800. Subtracting taxes, the net earnings amounted to $928 a mile, or less than two per cent. on the stock and bonds and less than three per cent. on the bonds alone. The roads paid, as interest on their debt, $1,969,331, or $245,171 more than the total net earnings, and only about one-third of the interest due was paid. The Commissioners had been directed by the legislature to determine "reasonable maximum rates," but in their report they say that they found great difficulty in doing so, "for the reason that the tariffs established by the companies themselves, except the River Division of the Milwaukee and St. Paul Company, have not produced revenues that were at all remunerative." Nevertheless, they went to work like men and made reductions which "reduced the receipts of the roads about $300,000," and indeed they think this is rather an underestimate. The Commissioners discovered in the course of their enquiries that the Granger panacea of fixing equal rates for equal distances, leaving out of view the important fact that the cost of transportation depends on many other things besides distance, is no panacea at all, but is in certain cases "unequal and objectionable." Reflecting on these singular facts, the people of Minnesota have come to the conclusion, that while the Commissioners as investigators and students have done the State great credit, they cannot be expected to do much in the way of lowering rates, and have very wisely destroyed the commission and left in office only one member of it, with advisory and investigatory powers only.

The text of the new French Constitution has come out by late mails, but does not differ in any important particular from the telegraphic summary. The composition of the Senate is as we have already given it, the Assembly electing seventy-five of the three hundred members for life; and they are all to serve without pay—an important provision, as it will prevent the Senate from becoming a kind of hospital for broken-down politicians. The President of the Republic is to be elected by a majority of both Senate and Assembly in joint convention, and he is to have the power of dissolving the Assembly, with the advice and consent of the Senate. He may propose a revision of the Constitution, as may either branch of the legislature, but no such revision is to be allowable until after the close of Marshal MacMahon's term of office. The President is to be impeachable for high treason, but for nothing else; he is eligible for any number of terms of seven years; and in case of his death his place is to be filled in the usual manner by a new election, the Council of Ministers exercising the executive powers in the interval. The seat of government is hereafter to be at Versailles and not Paris—a most desirable change, which, if made fifty years ago, might have modified for the better the course of French history. Of course, it cannot yet be said that France is really a republic, and the provisional régime at an end, for we have to see the Senate chosen, a new Assembly elected, and MacMahon's successor in his place, before it will be possible to speak confidently about the future. Two striking facts have been revealed by the debates. The first and most important is the growth of the Left in a political sense. They have, for the first time in French history, shown the wisdom which consists in taking what you can get when you cannot have what you want. The second is the anxiety of the Bonapartists to refer everything to universal suffrage, and the reluctance of the Republicans to meet them on this ground. The former are still very hopeful, and have been stimulated in audacity by the appearance of the Prince Imperial on the scene.

---

The rumors about Bismarck's approaching retirement from public life are as numerous as ever, but they have as yet received no confirmation. Besides his health, the only plausible reason for his resigning is the recent defeat of the Government in the Lower House, on a motion made by the well-known Professor Virchow, providing for the extension of the reform in county government made two years ago to the Rhine Provinces and that of Posen, which were then excepted from the operation of the law. The resolution was carried by a heavy majority, but as there is no "solidarity" in the Prussian Ministry, or, in other words, as the Cabinet does not stand or fall together as a corporation, there is no good German reason why Bismarck should be troubled by this, much less resign the Chancellorship. Posen was excepted for prudential reasons, being Polish, and the Rhine Provinces because they have had French administrative machinery ever since Napoleon's day. The reform in question is a process of consolidation, in the interest of simplification. The local administration has hitherto been divided between the president of the province, the president of the Bezirk or county, and the Landrath of the Kreis or conglomeration of parishes. The Kreis had an elective committee which aided and controlled the president of the county, but he is now made independent in most respects, and has complete control of the police, the elections, and the roads, but loses his supervision of the schools, which are to be specially provided for. The president of the province, on the other hand, who more distinctly represents the general government, is to be assisted by an elected committee, whom he is bound to consult in certain specified cases. The general tendency of all this legislation is to reserve the army and the higher offices of the state to the nobility, but to hand over the great bulk of the administrative work to unpaid officers taken from or chosen by the middle and lower class—a measure which not only diminishes expense, but gives the *bourgeoisie* the habits of political life, the want of which has been hitherto the great difficulty in the way of German political progress.

## THE POLITICAL PROSPECT.

IT has become tolerably plain within the last three months that, although the Republicans have done nothing to retrieve their position, the Democrats have done nothing to better theirs. The Force Bill, the Bounty Bill, the restoration in part of the franking privilege, and the child's play over the Tax Bill, satisfied most of those who voted against the party in power last fall that they had done right. On the other hand, the Democrats appear to have made no serious effort to follow up their success. Their selections of members of the House and of the Senate have generally been objectionable on some score. They have either been persons whose antecedents were odious, or whose opinions on the currency or some other leading topic of the day were likely to cause alarm or anxiety. The substitution of Cockrell for Schurz without the least hesitation, and indeed, one may say, without discussion, has been a fair sample in most ways of the use the party has made of its returning strength. But it is difficult to point to anything that has been done by it which is positively or outrageously bad. Indeed, its public utterances have, on the whole, been careful and reassuring. But the country is not satisfied with utterances or with the avoidance of outrageous acts. The character of the party is such that to regain people's confidence it must do more than keep out of scrapes. This is all that it has thus far attempted.

This failure of the Democrats to use their opportunities has prevented Republicans from suffering as much from their misconduct as they would otherwise have done, and they have even derived a certain amount of credit from their failure to carry out their desperate schemes. There are plenty of Republicans with whom the memories of the war are still so strong, that the defeat of the party in its attempt to suspend the habeas corpus in time of peace produces much the same effect on them as if it were the Democrats that had introduced this bill, and as if the Republicans had opposed it from the beginning. Their indulgence for the President, too, is so great that his announcement of his desire to overthrow the government of the State of Arkansas, in the interest of a ring of jobbers, is fully compensated for by his submission to the resolution of Congress forbidding his interference; and when he announces that he "recognizes" Governor Garland, they feel as grateful to him as if Garland held his place at his pleasure or needed this "recognition." In fact, there is no end to the odd and illogical condition of feeling which the great struggle has left behind it. One every now and then meets with even thoughtful and intelligent men, from whose minds the civil war has apparently blotted out all remembrance of the marvellousness of the combination of circumstances to which we owe the government under which we live, and who are as ready to change its structure as if one could any day go and order a new one at the watchmaker's. To make it what it is, and to create the habits and traditions which uphold it, has taken fully three hundred years, two great revolutions, and the untiring labor and patience and self-denial and forethought of ten generations of one of the foremost races of the world. The struggles which we in our own day see other countries going through, in their efforts to produce something even remotely resembling it, may serve to give us a slight, but only a slight, conception of its value—for that value is simply incalculable. And yet so deeply has the popular heart been stirred by the passions of the late conflict, that many of us are willing to excuse an attempt to overturn it—for we can hardly call the Force Bill anything else—as a mere police measure. To pay off the slaveholder and make the negro a little more comfortable, some of us are willing to tear down the very shelter which either we or they possess against the pelting of storms against which only a small portion of the human race has ever been able to make head.

This is a state of mind which the Democrats do not take sufficiently into account. They have never taken it into account, and, indeed, have shown in their political action so little ability to comprehend it ever since 1861, that one is almost driven to the conclusion that it is a difference of temperament, rather than of opinion, which separates them from the Republicans. The moment there is the slightest sign of relaxation in Republican fervor, they start up and behave as if the ideas, or illusions, if they prefer the word, on which the Republican party was based had lost all their force, or as if all its members were ready to acknowledge that the history of the last twenty years was a hideous mistake. In 1872, the symptoms of discontent which produced the Cincinnati Convention, which wise men in opposition would have turned to account, seemed to rob the leaders of the Opposition of even common-sense. So far from perceiving the gravity of the mistake made by the nomination of Greeley, and the extent of the disappointment produced by it, they went to work deliberately to adopt it, with numerous aggravations, and took great pains to show that they were, on the whole, more foolish than the "Liberals"—thus completely disgusting and driving off that large and growing body of thoughtful Republicans for whom four years of General Grant was enough, and who foresaw clearly, even then, the excesses of which that gentleman and his followers have been guilty, and who would now, with proper management, have been ready to co-operate with them. We do not mean to say that they have learnt nothing since then. On the contrary, we think they have learnt a great deal. Their language is vastly more moderate and their nominations have grown more respectable. Their leading men—Tilden, Bayard, Thurman, for instance—will certainly compare very well with anything the Republican party has to show; but they, nevertheless, do not seem yet sufficiently sensible of the difficulties they have to contend with, or, if they are sensible of them, their powers of contending are not equal to the occasion.

The general result of the events of the last three months may therefore, we think, be said to be that, though the Republicans have not made any additional losses, the Democrats have made no additional gains. The Republican rejoicings over the result in New Hampshire have been, not inaptly, compared by the *World* to the glee of a man who had just lost a large fortune over the finding of a cent; but, nevertheless, they are easily accounted for by the fact that the election shows that the follies of the majority in Congress during the past winter have not done as much damage as might have been expected. It has probably finally convinced most Republican politicians that a formal repudiation of the third-term scheme will hereafter be necessary in every canvass in order to escape defeat, to say nothing of winning a victory. This will in some degree simplify the Republican programme, but only in some degree; for there appears to be good reason for believing that the President approaches this matter from a totally different point from the rest of the world, and that the construction he puts on the New Hampshire election is, not that the disavowal of the third term saved the party from total defeat, but that it prevented a complete victory; and we believe there is nobody now whose opinion on such a point he rates higher than his own. This makes it extremely likely that the Republican Convention in 1876 will bear deeply the impress of his will. In other words, it will be composed largely of men ready either to renominate him, or nominate somebody whom he may designate for the succession, and relying a good deal more for success on the party machinery, including the civil service, than on public opinion. We have ourselves no doubt that the recent abolition of the civil-service rules is the first step in the canvass. These rules were instituted with a view to a renomination in 1872, and, in the then state of the public mind, this was a very shrewd and successful move, particularly as they were never allowed to interfere with the serious work of party management. If anybody complained of their violation in a particular place, he was told that they had not as yet been put in force at that point; or if he detected their violation at a point at which they had been unquestionably and publicly put in force. he was informed that the President was doing as well as he could; that nobody but himself knew the difficulties he had to contend with; that Rome was not built in a day; and that it was the duty of patriotic men to stand by him instead of grumbling. This particular line of operation having been now exhausted, the rules have been swept away altogether, pre-

paratory, as we believe, to an unflinching use of every department of the public service in the composition of the next nominating convention. There is, therefore, imminent danger that the nominee may be either General Grant himself, or somebody selected by him; and one would be as bad as the other.

Should either of these things happen, there will arise the danger that the Democrats, on their side, will be encouraged by it into the commission of a similar excess—that is, that they will presume sufficiently on Republican dissatisfaction to put up an inferior or obnoxious man, who would plunge the country once more into a struggle like that of 1872, over a "choice of evils," perhaps as demoralizing an experience as a political community can go through, because it kills, or chills, all hope or enthusiasm for positive advance or improvement, and disposes men to content themselves, as the part of wisdom, with anything which seems likely "to last their time." Already a good many Republicans whose hearts are really in reform are actually committing themselves to the Democrats, in anticipation of the control of the Republican machinery by the President; and, unless that functionary should greatly grow in grace between now and next year, the number of these faint-hearted is pretty sure to increase. There is only one way both of checking this and of warning both parties that their old tricks must not be repeated, and that is the preparation of some such expression of opinion on the part of the reform element in the Republican party as will force both conventions into giving us not a choice of evils, but a choice of goods—or, in other words, compel them to make good nominations. About their platforms nobody, after the experience of the last two years, cares anything. The Republican platform at Philadelphia has proved a shameless piece of imposture. The managers ought to understand that its repetition will be of no particular use to them, but about this the country is willing to let them take their own course. They may nominate on what platform they please. A chapter from Artemus Ward would do as well as anything they are likely to draw up. What honest men will insist on is that the candidate must be a man of high character—sufficiently high to be able to follow his own judgment—who understands civil government, has been bred in American political traditions and reverences them, and who is pure, and likely to remain pure, in money matters. We want an end to two things—corruption and lawlessness.

## A STUDY IN MUNICIPAL GOVERNMENT.

THE difficulties which attend all efforts to secure good administration in New York are nowhere better seen than in the case of the Department of Charities and Corrections in this city. In most of the branches of the government, in the Courts, in the Public Works, in the Fire Department, the "machine" runs of itself, without any outside supervision, except, perhaps, at rare intervals. Now and then some gross abuse of justice, such as were rife during the Barnard-Cardozo régime, may arouse popular indignation, and produce a thoroughgoing reform; here and there an extreme case of reckless inhumanity, like that of the arrest of a poor paralytic, and his imprisonment on a false charge concocted by the officers of justice, ending in his death, may lead to an investigation, a newspaper exposure, and make people wonder for a day or two who it is that governs them, and whether they really have themselves anything to do with the matter. But, in most cases, this storm soon blows over and everything goes on as before; indeed, in most cases there is no storm at all. The Department of Charities and Corrections is, however, differently situated. This Department, which has under its charge the entire body of penal and reformatory institutions, work-houses, prisons, hospitals, and school-ships, belonging to the city, is subject in theory to constant and active supervision, so that more ought to be known about it than about any other part of the government.

The Department is managed by three Commissioners appointed by the Mayor, who have the general care of the victualling, lighting, cleaning, maintenance, and discipline of all the public institutions. They appoint all the inferior officers, all the wardens, physicians, and orderlies; they make contracts for and purchase all the food and clothing; they have in certain cases judicial authority. To secure efficient and responsible men for these positions, all sorts of checks and safeguards have been devised. The reformers who drew up the present charter of the city, wisely acting upon the presumption (which seems to have governed them throughout) that its officials must be considered dishonest in the absence of distinct proof that they are honest, have surrounded all their powers over contracts for supplies—the usual source of corruption—with formalities and safeguards so numerous and solemn as almost to give the ratification of a contract of this sort the solemnity of a religious rite. Some half-dozen different steps, each one formal but essential, are necessary to make binding the purchase of a few hundred pounds of beef, and these steps are directed, first, to making all purchases public, in open market, and, second, to securing for all contracts the express approval of the chief fiscal officer of the city. The late Commissioners, who were turned out of office the other day for permitting Tweed the use of his cottage-furniture, evaded these provisions, or rather violated them directly, because they maintained that the system was too complicated; that for contracts subject to such onerous restrictions the best class of merchants would not bid. Whether this was true or not, the new Commissioners, we understand, faithfully comply with the letter of the charter, though we have been told by one of them that this compliance is bad for the public interest. Whether bad or good, there can be no doubt that the most stringent checks have been thrown around their action to prevent dishonesty.

That Commissioners of Charities and Corrections, however, should be honest, though a *sine quâ non*, is not by any means the only important thing. The discipline and encouragement of penal and reformatory institutions, as well as hospitals, have been of late years systematically studied by philanthropists and physicians, so that we may almost say its theory has reached the rank of a progressive science. To instance merely one or two matters: the Irish prison-system, so-called, has revolutionized the principles of prison discipline by demonstrating the possibility of making penal institutions really reformatory; the researches prosecuted by means of criminal statistics have thrown a startling light upon the heritability of criminal tendencies; enquiries prosecuted into the subsequent lives of children who have been sent out into the world from public institutions have brought out in a very strong way the effect of these very reformatory institutions as nurseries of crime, while experiments in Germany have proved the possibility of doing away with them almost altogether. Researches into the principles of hospital construction have revealed radical errors in existing methods, and proved that many buildings which have been the boast and pride of this city for years are in reality hotbeds of disease, and should—if the health of the city is considered—be not improved, but removed as public nuisances. As a matter of fact, the public institutions of New York are by no means the best illustrations in the world of the application of the results of science to the cure of crime and disease; and for this reason the Commissioners need to be men who are not only thoroughly conversant with the existing knowledge on the subject, but have a good deal of reformatory zeal also.

The idea of a Commissioner of Charities in New York being a man who is thoroughly informed as to the duties of his office is so ludicrous that it is not worth while discussing it. He receives a salary not large enough to enable him to devote all his attention to them, and he is selected on account of his political affiliations. What politics means in this office we may see by reflecting that, during the incumbency of the Reform Commissioners appointed by Mayor Havemeyer, the question chiefly before the Board was not whether there might be improvements in hospital construction, not whether "institutionizing children" was a good system, but whether Tweed, a notorious malefactor on Blackwell's Island, should have a set of cottage furniture and a private library. This question was not a simple one; it was a matter of life and death to the Commissioners whether they decided it wrongly or rightly. They decided

it wrongly, and were turned out of office, and a new board installed in their stead.

As we said at the outset, this Board, which has in its charge the most sacred trust the city confides to any one, is in theory a public institution, and subject to the attentive supervision of a body known as the "State Board of Charities"; and of course publicity with regard to the doings of such a commission is as essential as honesty or intelligence. But, if any one desires to find out anything about its operations, its intentions, aims, methods of appointment, etc., we can assure him that he will find it extremely difficult. We have before us the last published report of this body that is known to exist. It appeared in 1870, and if any reports have been made since, we do not know where they are to be seen. Every year at about this time a good deal of information does get out and is discussed in the newspapers, but it comes from a voluntary association of humane people, known as the State Charities Aid Association, who examine from time to time into the condition of these institutions; but they have no authority over the employés; they cannot compel investigation into the behavior of officials; and, in short, they have no means at their disposal of effecting anything except by persuasion or by the force of public opinion. As an illustration of the difficulties with which they have to contend, we may cite an instance given in the last annual report of the local New York Visiting Committee. In the summer of 1873, Mr. William Rathbone of Liverpool, founder of the Liverpool training-school for nurses, offered to send to New York for one of the hospitals a superintendent and her assistant, with six trained nurses. The whole staff had been trained at Mr. Rathbone's expense, at a cost of a thousand dollars; and the importance of getting them here may be inferred from the simple fact that, till within a year or two, trained nurses have had no existence in the United States—the only kind procurable for public institutions being women "sent up" for debauchery or disorderly conduct. This local New York volunteer committee agreed to pay the passage of these nurses to this country if, on their arrival, the Commissioners would appoint them to one of the hospitals. One of the Commissioners was disposed to accept the proposal; the other two declined, on the ground that "it would not do to import foreigners to do our work."

But politics, meantime, goes bravely on. In the last five years there have been three, if not more, Boards of Commissioners. The last two were twice "investigated," and the whole Department has been so thoroughly and persistently reformed that at its head now we find Mr. Isaac H. Bailey, an ex-Custom-house politician, whose qualifications for the place may be guessed at. In August last the entire medical board of one of the principal hospitals was reorganized, and within the past week or two it has been reorganized back again. Every year, we believe, a report on the condition of the charitable institutions is read by this volunteer committee to the Commissioners, and listened to by them with great solemnity, but in complete silence, which is undoubtedly the best way of "meeting criticism." Such is the machine. And the reason why it is such is that the city charities, like other city institutions, are managed with the view of securing votes and rewarding "workers," and they cannot under the present system be used for anything else.

## A STUDY OF TOWN-MEETING LEGISLATION.

### THE BRIGHT SIDE.

A PROLONGED continuance of the present condition of our national politics can hardly be enthusiastically advocated by anybody. Indeed, a considerable amount of determined optimism is quite essential to all believers in "the great future of American democracy," and, even with this in store, a man should receive "some credit for being jolly" under present circumstances. One need not be of gloomy temperament to think it may become necessary to provide a Jeremiah to chant lamentations after the singing of the centennial hymn. Not only do the conflicting elements of some troublesome questions place their solution outside the limits of ordinary prophecy, but there are also many active political tendencies so thoroughly bad that it is only a perception of the probable growth of counteracting influences that can cause a looker-on to be hopeful of the result. Are we always to be astounded by giant schemes for "internal improvement," and, if so, are their accompaniments always to be like those of Pacific Mail, El Paso, and the Crédit Mobilier? Must we for ever hammer away on the tariff—welding, broadening, contracting? Will the currency problem ever be put on the right track, and kept there, not to be thrown off by an inflation-switch at the next Congressional crossing? Will Reconstruction end in anything reconstructed, or is it an everlasting process, in which nothing can ever "stay put"? There are perhaps a dozen different matters, the fruitless discussion of which occupies at least eight-tenths of the time of Congress, all of which matters many voters would like to have decided, if possible, in accordance with general principles—so thoroughly disposed of, in fact, that they would for ever cease to be political issues, and be heard of, if at all, only in the courts. Nevertheless, we do not believe the time has yet come for a correct solution of many of these disturbing problems of our politics. It is no disparagement of the average intelligence to say that the people of this country have not yet formed any definite opinion with regard to the proper settlement of many of these matters. It is quite probable that the majority of voters to-day do not believe it is possible, for instance, to dispose of the railroad question, or the tariff question, or the currency question, in the light of general principles, but believe that we must continue to do the best we can from year to year, each succeeding Congress correcting as much as possible the blunders of its predecessor. There are probably very few people who have any belief whatever in a science of legislation. But there are very many, and the number daily increases, who believe that study and reflection are of value as helps to something better than the haphazard legislation in which we have of late so much indulged. These last will agree with us that even a town-meeting may throw light on some questions of national interest. The town has been called the unit of our political system, and, if the whole exhibit the character of its parts, its political methods should be studied before those of the country at large. Besides, where the field is so small that all portions can be viewed at once, some relations may be understood which would escape notice altogether where the field is the nation.

Most New England towns still exhibit that same simplicity of organization with which all have become familiar in De Tocqueville's well-known description. The inhabitants are of the same descent, traditions, and religious feelings, are engaged in the same occupations, and their interests are almost absolutely identical. Naturally given to order, sobriety, and economy, they need only that which they already possess—a simple form of self-government. We are speaking now only of the agricultural towns, some of which are, in fact, so purely bucolic that under the name of farmer may be placed almost every man within their borders. We thought once that we had reached the limit of sameness when, in New Hampshire, we found a town all the men of which were farmers, with the exception of two—the regular Puritan minister, who also taught school, and a store-keeper, who was also postmaster; but the very next town had not even a minister, and the postmaster was also a farmer. The only political change in these towns for many years is that "the parish committee, who audit the expenses for public worship," no longer exist, each sect now paying its own expenses. At the annual meetings of these small and homogeneous communities, voters divide upon the choice of chairman or "moderator," the selectmen, the assessor, and other town officers, the representative to the State Legislature, and the amount of money to be paid for teaching and for road repairs. Once in a generation, perhaps, some great question—the building of a town-hall or the purchase of a new cemetery—may create unusual contention. It is hardly possible for these little and monotonous towns to furnish any hint whatever for the conduct of national affairs. If the whole nation had a similar homogeneous population, with the same circumscribed pursuits, with the same feelings, from those of religion to those which control the government of a poor-house, and with identical public aims—the preservation of order, the repair of roads, and provision for elementary education—we should need no theory of legislation. Conflicting interests are scarcely conceivable where all desire to procure essentially the same things, and are willing to vote the taxes necessary to procure them. It is only when we pass from these agricultural towns to other towns in which the character and interests of the people have become almost as heterogeneous as has the nation itself, that we feel any necessity for a system of legislation, or are tempted to wish for a definite science of government. In these latter towns, self-government passes with wonderful and almost imperceptible rapidity into something closely akin to despotism, and this transition furnishes a theme for useful reflection.

For the sake of unity and greater distinctness, we shall confine our description and illustrations to one large inland town of about ten thousand inhabitants. Here the farmer is slowly disappearing. Already manu-

facturer, mechanic, and merchant either outnumber him or obscure him by superior activity. Running streams have built cotton and paper mills, and these have brought in the Irishman and the French Canadian, so that the Calvinist walks to town-meeting with the Catholic, and both shake hands with the modern rationalist as they ask him how he intends to vote on the proposed town loan to the new railroad. Notwithstanding the different nationalities represented and the varieties of character to be found, the old New England element is yet largely predominant, and, for special reasons which need not be here given, the Puritan traditions are cherished with peculiar strength of feeling.

The annual meeting is held in a bare and uncomfortable hall, a facsimile of which is to be found in all New England towns. This one, however, is larger than the average, seating from seven hundred to a thousand persons, the number in attendance sometimes reaching this latter limit. A few of our readers may need to be reminded that these meetings are called by the selectmen, the trustees, or principal executive body of the town, who issue a "warrant," giving the time of meeting, and stating the various questions upon which the decision of voters will be required. Only subjects specified in this warrant can properly be brought before the meeting. All therefore are forewarned of the business to be introduced, and, the principal topics having been pretty well talked over in homes and stores, all come to the meeting with at least some preparation for voting understandingly.

The scene, to an observer, is thoroughly interesting. Here are perhaps eight hundred men, who give unflagging attention to all the proceedings. Every man present knows something of every question presented, and very few would shrink from giving expression to an opinion if needed. The town is wealthy, and the subjects discussed sometimes involve an outlay of hundreds of thousands of dollars. Under these circumstances, the character and tone of the discussions are most admirable, and the amount of business done, and well done, is really wonderful, compared with the experience of other legislative bodies. The speeches are straightforward, pointed, short, and are generally positive contributions to the debates. Very few speeches are made for show, and oratorical embellishments are seldom well received. Buncombe is a deadly sin. We were present once (the question referring to the election of a town surveyor, many wishing to return to a former system of district supervision) when a speaker began with, "It has been said, sir, that revolutions never go backward"; but in extenuation of this unusual declamation it should be explained that the speaker was a lawyer and an ex-member of Congress. Not only are the subjects of universal personal interest, and the speeches more liable, therefore, to be direct expressions of opinions, but the economical New Englander always wishes to finish town business in one day, if possible. He is willing to give this amount of time from his customary occupations, but more than this he begrudges; hence another reason for his impatience of all useless rhetoric. The attention given to all proceedings is almost church-like; there is no writing or wandering about the hall, and very little private conversation. In consequence of this attention, every slip which a speaker may make in statement of fact is taken advantage of immediately, and attempts to screen personal interest in any subject are exposed in a manner which to tender sensibilities must seem positively cruel. Notwithstanding the business-like tone of most of the proceedings, there is always a keen enjoyment of sharp replies and of those personal hits made so easy by the intimate acquaintanceship of long-time neighbors. There is little real humor, though always some, and the wit is severe rather than delicate. A man, for instance, begins a rambling, querulous talk about a certain road near his house which is not in good order. After waiting long enough to ascertain that this complaint is all he really has to say, he is interrupted by the question, "Why didn't you tell the surveyor and have the thing fixed, instead of waiting until town-meeting and coming here to complain?" The laugh which follows this question effectually ends his complaint. Again, the town-clock is out of order. For generations this clock has been in the steeple of the old town-church, the preacher of which has lately been suspected of heresy. Immediately a number of suggestions are offered, all of which connect the irregularities of the old clock with the supposed irregularities in the theology taught below. These hits are evidently intensely enjoyed, but to an outsider, it must be confessed, they are somewhat dreary. While the speaking, as at all large public meetings, is mostly done by a few, yet these few appear to be recognized as only convenient mouthpieces; for they are rigorously criticised, and are plied with questions from all parts of the hall. These questions are usually put in parliamentary form, and parliamentary rules are quite strictly adhered to throughout, the moderator being chosen generally with reference to his knowledge of them, and his ability to enforce them. National politics do not enter at all into the discussions, nor do they seem in any way to influence opinions upon town matters, and State politics are recognized only in the election of a representative to the Legislature. One of the most striking characteristics of these meetings is the unfailing good temper manifested by every one who takes part. In this respect we know of few other legislative bodies which can compare with them. We have been present when exciting subjects were debated, and when personal feeling ran very high indeed; but we have never seen a speaker give way to passion, or indulge in that vituperative blackguardism so common in other places. In view of the frequent occurrence of a "tumult" in the French Assembly, or a "row" in our own Congress, the genuine decorum of these townsmen is doubly admirable.

It is with regret (tempered, however, by some things to be explained hereafter) that we announce the approaching end of these long-continued meetings. The town, doubtless, will soon apply for a city charter, and the old hall will give place to a building befitting a more pretentious form of government. Already Mr. Patrick Maloney is getting ready to run for the common council, and the speculator is marking street lines and laying out lots. Whatever advantages may be gained by the change from town to city government, no old resident at least, and we think few others, will deny that the bright side of town-meeting is very bright indeed. A consideration of the dark side we shall reserve for another portion of our article.

## ENGLAND.—THE LESSON OF KENEALY.

LONDON, February 27.

IN thinking over the causes which have led to the eccentric election of Dr. Kenealy, I am reminded of the answer given by Jemmy Hirst, the Yorkshire oddity, to King George the Third, when the King asked him how he liked London. "I like it weel enow," he answered; "but I hadn't ony idea afore yesterday and to-day there were sae mony fools in it." The first impression you form as to the meaning of the transaction is that it is a piece of illimitable folly, or, if not folly, a kind of morbid ailment that has affected an extremity of the political body, and which had to run its course. But the more you dwell upon it, the less you like it, and the more serious both in its causes and its possible consequences does it seem. It shows, in the first place, that that strange aberration of intelligence which possessed a considerable section of the English nation for upwards of two years in the matter of Arthur Orton's identity has by no means passed away with the verdict of the jury and Orton's conviction as a felon, but, on the contrary, that it is more widely spread and more deeply rooted than any ordinary observer could have imagined. Not long ago I was at Portland, the great convict prison on the English Channel, and happened to say to some of the small shopkeepers there that they would probably have Arthur Orton shortly with them. They were furious at the suggestion, and insisted upon it that if there was any justice in the land, and if any one should be sent to their prison, it ought to be Lord Coleridge, the Lord Chief-Justice of England, his brother judges, and the counsel who prosecuted Orton. I could not reason them nor laugh them out of their conviction. I found a similar feeling among some of the shopkeepers at Southampton; and the other day, when Mr. Evelyn Ashley, the member for Poole, attempted to ridicule the election of Dr. Kenealy before a large audience at Ryde, in the Isle of Wight, they hooted him, and refused to listen to another word he said. But though aware that wild opinions of this kind were held in parts of England as to the innocence of Dr. Kenealy's client, I frankly admit that it did not occur to me that any constituency, either in England or Scotland, would have been so beside itself as to send such a representative to Parliament as Stoke-upon-Trent has selected. From "mad Tipperary" anything might have been anticipated in a moment of Irish elation. But it surpasses belief that a community of eighteen thousand electors, consisting of stolid English workingmen and petty tradesmen, soberly and seriously, and without any notion of practising a practical joke upon the legislature, should send such a man as Dr. Kenealy to represent their political opinions in the House of Commons. He has been returned without one question as to his political views. Not one of the electors—perhaps not even their chosen representative himself—knows to which party in the state he adheres. He has, through the *Englishman*, the organ which he edits, poured out torrents of vituperation and contempt impartially upon both sides of the House and upon the Speaker. He was not returned as a follower of Mr. Disraeli, nor as a follower of Lord Hartington. He takes his seat unpledged to any line of policy or conduct. He is the defender of an impudent impostor, and he has been returned to the great Commons House of England by six thousand electors, with the one object of getting a convicted felon released from prison. This sort of action on the part of a large constituency puts all old-fashioned notions and

stereotyped ideas upon party organization out of gear. If thousands of electors in one place allow their wayward fancies to run riot in this manner, all political calculations and combinations will come to naught. Whims and vagaries will govern elections, and notoriety and not worth will be the true gateway to success.

And now a word as to the more serious consequences which I think this election suggests. You may remember that in my letter of January 16, I hazarded an opinion which in effect came to this : that in some constituencies—I hope not in many—the proletariat is practically omnipotent, now that they have got a household franchise and vote by ballot. If any question should arise in which the working, wage-earning classes are taught by agitators or others that their interests are affected, the wage-paying and educated classes in the community will be elbowed out of the field. This time last year, immediately after the present Government came into office, they appointed a Royal Commission to enquire into and report upon the operation of certain statutes affecting the relations of the employers and the employed. They were called the Labor Laws Commission, and they consisted of Lord Chief-Justice Cockburn ; Lord Winmarleigh, who, as Mr. Wilson-Patten in the House of Commons, had long taken an active part in questions affecting the working classes ; Mr. Bouverie, a Privy Councillor and a most experienced legislator ; Mr. Russell-Gurney, whom you know well in America ; Mr. Justice Smith ; Mr. Roebuck ; Mr. Thomas Hughes, a typical workingman's friend ; Mr. Goldney, and Mr. Macdonald, one of the workingmen's representatives in the House of Commons. It was a strong Commission, and fairly representative, and the object of its appointment was an honest one—to enquire impartially into the alleged grievances of the working-classes under the Master and Servants Act, the Trades-Union Act, and the Conspiracy Act. The trades-unionists maintained that their grievances were so patent and clamorous that it was a farce to appoint any Commission, and they obstinately refused to recognize it or to give evidence before it. The report of the Commission has just been issued. It is an able document, drawn up with great care, and entering fully into all the questions which were before the Commissioners. It is said to have been written by the Lord Chief-Justice, but I cannot vouch for this, and it is signed by all the Commissioners except Mr. Macdonald, who, without professing to argue out any of the conclusions, blankly refuses his concurrence in any of the opinions expressed, and adheres to those of the trades-unionists. The report is dead against the unionists in almost every essential particular, and it carries conviction with it to all reasonable men. But it is as certain as any undetermined matter can be that it will not convince a single leader of the working-classes. They have their own view upon the questions, cut and dry, and no reasoning will shake it. Now, if the Government should attempt to legislate upon the lines of this report, the working-classes, led by their paid agitators, will oppose the measure with all the resources in their power. No candidate for any constituency where the workingmen are numerous will venture to agree with the reasonable conclusions of the commission, or the moderate proposals of the Government, founded on these conclusions. He must shut his ears to reason and to common sense, and pledge himself to the cut-and-dry views of the trades-unionists ; and so much sought after is a seat in the House of Commons that men of position and education will be found to do this. But if he haggles over any of the most extreme proposals, the constituency will pass him by, and select some wild man of the Kenealy type. And now, after this election at Stoke-upon-Trent, it is only too apparent that the proletariat can do what they like. They are omnipotent in not a few important constituencies, and that is a solemn fact which English politicians must make up their minds to accept. I do not say that it is necessarily a bad thing that the working-classes should have their views represented, however extreme or wrong-headed these views may seem to men who do not belong to these classes, like the Lord Chief-Justice of England and his eminent colleagues on the Commission. I merely say that the return of Dr. Kenealy by an enormous majority in a constituency where the working-classes number about seven-ninths of the whole constituency, shows what these classes can do when they are united.

As for Dr. Kenealy himself, he will, as Walpole said of Wilkes, do less harm in the House of Commons than anywhere else. The House has a rough-and-ready way of dealing with eccentricities. Every man who comes within the rigid criticism of that assembly soon finds his level. Every newcomer, it matters not what he is, is treated at first with courtesy and consideration. The House always listens with attention, and generally with good nature, to a maiden speech, and anything like diffidence or nervousness it treats with leniency and generous encouragement. But self-assertion or bumptiousness it cannot abide, and it is cruelly intolerant of bores and one-ideaed men. Dr. Kenealy will meet with studious consideration when he first essays to speak. But if he insists on parading the Orton grievance upon the attention of the House, his reception will be very different from that which awaited him at Stoke. The House has many effective ways of silencing a bore. An animated conversation carried on in every corner by the various members seated in their places soon deadens the voice of even the most animated speaker. A chorus of cries of "divide," "divide," "'vide," "'vide," proceeding from both sides at once whenever the speaker opens his mouth, embarrasses even the most hardened orator. But the most effectual way of bringing a one-ideaed man to his senses is the process of "counting out," and this is probably the course that will be followed with the chosen of Stoke. It is a rule of the House that forty members must be present. When an orator becomes troublesome, a stampede of members takes place from the House to the lobbies, or the smoking-rooms, or the library. Some one gets up from a back bench, and calls the Speaker's attention to the sparse attendance. The Speaker counts the House, finds there are not forty members present, orders the electric bells to be rung and the sand-glass to be turned. The stampeded members stand outside till the sand has run its two minutes' course, and the electric bells have rung out. The doors are closed, there are not forty members, and the House stands adjourned till the following day, when there is a new order of business, and the orator of the previous night has lost his chance, and may not get another till the following session. It is an effective way of silencing a bore.

## MORE LAMENTATIONS OVER SCHENCK.

To the Editor of The Nation :

Sir : National anniversaries are of right of much greater importance to Americans abroad than to you at home, and whenever Washington's Birthday or Independence-Day came back, we used to have a habit of getting together in some manner, or, at least, of calling on our Minister or Consul to renew vicariously our nationality.

Your readers can therefore appreciate the importance, to Americans resident abroad, of a Minister. To you at home he is only an official myth —in three cases out of four a scrubby politician sent abroad to pay him for sacrificing his self-respect and honest patriotism to party exigencies ; and your strongest feeling, if you have one, on his going abroad, is, that he is out of the way of mischief ; but to us he is the impersonation of our country. Now and then, at wide intervals of space and time, he is a man like George P. Marsh or Charles F. Adams, who confirms us for the moment in our happy delusion that ours is a great, wise, and dignified Government ; but, in general, we are content if he is no worse than incapable. I have lived abroad under many régimes, and often had cause to blush for the official representative of my country, for drunkenness, meanness, profligacy, ignorance, incapacity, venality ; but until I lived under the protecting presence of General Schenck I have never had to deprecate, as an American, a connection with swindling. I don't know what my fellow-countrymen resident here, in general, think of the matter, as, since I have had to avoid his house, I rarely meet them ; but I hope you will accord me the privilege of expressing the feeling of those I do know, as well as of the Englishmen I know who really admire America. It is one of intense shame perpetually, quickened by every mention in the daily papers of his great achievement, as well as by every mention of his name, and heightened by indignation at the implied approbation of our Government of an offence against diplomatic decency and social dignity such as has never been known in our day in the capital of a great country. I doubt if there is another civilized government, the meanest under the sun, that would dare so to outrage the self-respect of its respectable citizens as to compel them, year after year, to endure the humiliation of seeing their representative protected by his official capacity from a criminal suit, and hearing the head of their Government commonly and plausibly accused of participating in the swindle—of hearing his country identified in its highest personalities with a mean and flagrant fraud. I wish every man who reads my letter would sit by himself and think long enough to realize that every honest American in England has perpetually under his eyes this national shame—that he runs the risk every time that he dines with a party of Englishmen of being made to blush by an allusion to the Emma Mine or General Schenck, and that he must blush in silence, for there is not one word that can be said in mitigation of the disgrace ; that whenever he takes up a morning paper he may see that some beggared victim of Grant

and Schenck has instituted a criminal action against the American Minister for complicity in a swindle which but for his name might never have been a swindle at all, and would certainly not have been a successful one; that he cannot go to his Minister's receptions with self-respect, or, if he went, meet there an Englishman who has any; that when Jim Fisk is quoted as a standard American, he dare not say that he was not.

That's the way we stand, and I wish that, since General Grant and his official advisers are lost to all sense of diplomatic propriety, every honest editor in the United States would hear our complaint, and repeat it till the whole country felt the shame.

Yours truly, W. J. Stillman.

8 Altenburg Gardens, Clapham Common, London, Feb. 22.

## THE SECOND STAGE OF WISCONSIN RAILROAD LEGISLATION.

To the Editor of The Nation:

Sir: Having been at Madison during most of the time when legislation concerning railroads was progressing, I venture to send a slight contribution to its history as it appeared to an outsider.

Many business men, among them the railroad managers, have, in common with yourself, been trying to believe that the notorious piece of legislation known as the Potter Law was the result of an outburst of passion, manipulated with mischievous skill by ambitious politicians. With you, they hoped that by this winter, when tempers had a chance to cool, wisdom would return, better counsels would prevail, and the obnoxious features of the law be repealed. There were grounds for these hopes. So far as could be judged, there seemed to be a growing feeling that the law was unjust, or at the least too stringent in some of its provisions; and there was, on the part of its advocates, a most vociferous declaration that if such were the case it should certainly be changed, for no injustice to anybody was contemplated. The whole question, so far as action of our legislature was concerned, hinged upon this *if*, about which the companies and the Grangers differ so widely. As the Railroad Commissioners, though appointed by one party to the contest, constituted the only tribunal whose decision would be accepted, their conclusions were awaited with anxiety and interest. They were not soon forthcoming. The true cause was doubtless the one given by the Commissioners: that they were overworked, the job proving a bigger one than they expected; but the delay was made the occasion of many mysterious hints. Their report was finally submitted about the middle of February. It would perhaps be unfair to criticise a work prepared under such pressure, but it must be said that in this bulky volume of nearly 700 pages there is a good deal for which want of time is about the worst excuse, since it might so well have been omitted. As a specimen, in discussing the question of cheap transportation, how forcible and pertinent is the following: "Hence commerce is as old as civilization, and has of necessity been as unresting as the forces of nature; plying upon inland seas, along the ocean shores, and upon navigable rivers, *which, by a wise provision of nature, open highways into the interior of continents!*" For some unexplained reason, that other "wise provision of nature" by which navigable rivers are always conducted past large towns is not referred to. However, there is evidence of conscientious labor and of labor employed in the right spirit and in the right direction. With some superfluous verbiage, there is much that may be studied with advantage by men about to legislate on the railroad question. You will doubtless see and discuss the report. Its conclusions were that "the only form of railway control likely to prove successful under present conditions is the legislative, supplemented by direct supervision; the legislature laying down general rules of action, but leaving the application and enforcement of those rules to a commission."

There was some divergence of opinion among the Commissioners; but a bill, supposed to contain provisions in accordance with these conclusions, was eventually prepared and heartily urged by two of the number; the third, though not fully concurring, would not, it was understood, oppose it. This bill added to the functions and increased the powers of the Commissioners, and in some respects exceeded in stringency the present law; but, leaving passenger rates unchanged, it substituted a limitation of profits for an arbitrary tariff, leaving the companies control of their business below that point. The limit was "ten per cent. on the cash value of the road, as determined by the Commissioners, including taxes and licenses," meaning that, out of this nominal net-earning, taxes and licenses were to be paid, leaving the net really something over eight per cent. Although coming from constituents who were as a whole disposed to make concessions, the temper of the legislature was at this time unfriendly to the roads. Among other things, the prolonged senatorial contest had made a good deal of bad blood. It was charged, whether rightly or wrongly, that Senator Carpenter's defeat was due to railroad interference. That gentleman's speeches after he was beaten were calculated to confirm and strengthen this prejudice, being little else than tirades against capital. Railroad managers, convinced that it was hopeless to think of repealing the Potter Law, and that the utmost they need expect was to obtain some mitigation of its hardships, decided to ask two slight amendments to the Commissioners' bill, and advocate its passage. Their amendments were adopted in committee, but they might have spared themselves this trouble.

The bill came before the Assembly, and its framers were asked to explain its provisions. Commissioner Hoyt proceeded to do this in an able manner. He alluded to the difficulties under which they had labored as an excuse for the inconclusive nature of some of their work; he hinted at some of the defects of the Potter Law, and explained in what manner it was proposed to remedy them. He handled the subject somewhat gingerly, but on the whole well and with tact. Venturing in conclusion to make an appeal to the magnanimity of the people through their representatives, he went a step too far, and was brought to by being bluntly told that the Assembly was there to be informed as to the provisions of his bill, and not to be harangued. This snub, which was swallowed with as good grace as could have been expected, was but the beginning of a series which must have been unpalatable. The bill was warmly advocated by its friends; but without other discussion on the part of the Grangers than threadbare denunciations of monopolies and thinly-veiled insinuations concerning the Commissioners, it was ignominiously defeated in both houses. The agricultural legislators enjoy too keenly the exercise of unlimited power over one hundred millions of capital to consent to delegate it to a board of Commissioners, concerning whom their remarks were the reverse of complimentary. Those gentlemen had reached conclusions that were not acceptable to the power that created them, and so they were dropped, and in all the subsequent negotiations between the roads and the Grangers the Commissioners and their suggestions were ignored in the most contemptuous manner. There was now before both houses a bill known as the Quimby Amendment, purporting to perfect the Potter Law, which it did by giving it added stringency. The only thing left for the roads to do was to beg for such slight relief, by way of modification of this bill, as might be vouchsafed them. This they proceeded to do in the most deferential, not to say abject, manner. Conferring with a committee of five appointed, not by either house, but by the Grange organization, they were offered a concession amounting to about one per cent. on the freight traffic affected.

It may be as well to explain here in what manner that master of the subject of transportation—Senator Potter—arrived at the rates that appear in his law. There was a good deal of curiosity to know how they were obtained, which was gratified with reluctance on his part. It appears that he took the lowest published tariff, and deducted twenty-five per cent. all around. This scientific method was pursued throughout all the negotiations. Affecting vitally millions of capital, and indirectly the whole State, this question of rates and earnings has been treated in the same spirit in which they would squabble over a constable's fees. Not to dwell on these disagreeable details, an amendment was finally adopted which increased the old rates by a small fraction, and the friends of fair dealing, aided by those who were willing to throw a small sop to the roads, succeeded in carrying it. With this they must be content, and it is questionable whether the concession is worth the forfeiture of principle and self-respect which it cost to obtain it.

The leaders of the Granger element are shrewd and unscrupulous, the rank-and-file well drilled and submissive, and the temper of the whole organization narrow and vindictive. A sullen spirit of retaliation was manifested throughout which can only be likened to that which was shown years ago on the line of the Michigan Central, when for certain alleged grievances men justified themselves in placing obstructions on the track, killing and wounding scores of innocent people by way of revenging themselves upon the company. It was useless to attempt to show them that the oppression and the abuses of which they complained had been something overstated. Their own Commissioners, forced to this conclusion, and having the manhood to announce it, were snubbed and slandered. The companies laid before them a memorial, which discussed the whole question ably and fully, establishing by unanswerable statistics that Wisconsin roads had been built cheaper than most others, and that the rates prescribed by the Potter Law were far below those of the roads of any State in the Union or of any foreign country. The only reply of Mr. Potter and his congeners was that they did not believe it. When the gentlemen representing the unfortunate stockholders assured them that a persistence in these low rates meant absolute ruin to the companies, it was sneered at as pure mendacity; while others, less discreet, plainly said that they hoped that

it did mean ruin, for then, if sold in bankruptcy, the roads would pass into new hands at such reduced figures that they could be profitably operated at the low rates. It did not seem to occur to them that capitalists would be slow to buy in the roads at even $10,000 per mile, when there was every reason to fear that the action of the next legislature might result in selling them out at $5,000 or perhaps $1,000 per mile.

In view of the fact that the roads obtained a slight advance, there were those who hoped that a break was made in the ranks of the Grangers; but there were but slight grounds for such an opinion. There is good reason for believing that when the legislature met they expected to do more than they have done. The consciousness of power brought with it a determination to exercise it, and it is questionable whether the relief given was not granted in the same spirit that the cat gives the mouse a respite in order that the tormenting which is so interesting may last the longer. At any rate—to paraphrase slightly the language of the most blatant of their spokesmen—they have yet to learn that there is anything oppressive or unjust in the provisions of the Potter Law; anything dishonorable in exacting compulsory service upon their own terms; anything disgraceful in sneaking out of a solemn compact after the benefits have been received, if only it be done by a class instead of an individual. There was not, so far as my observation went, even among opponents to the bill, a single member who, when pleading for mercy or generosity to the roads, did not feel called upon to preface his remarks with the assurance that he regarded the *principles* of the Potter Law as just and right, and that no one would go further than he to uphold them, although he did think some of its provisions a little stringent.

The Commissioners stated not only in the Assembly but before the committees and privately, that their bill was by them intended as a step toward the inauguration of a system under which the earnings of all capital should be regulated by legislation. Several bills intended to control both corporate and private capital, and quite in consonance with the legislative spirit of the fifteenth century, were introduced and defeated, not in fair fight, but only by manœuvring tactics. The Grangers did not, of course, confine themselves to this class of legislation, but took concerted action on most important measures that came up. Daily secret meetings were held wherein plans of action were matured. It was even thought by many that they had certain cues or signals, by means of which the leaders gave their orders whenever unexpected contingencies or complications arose. With a good working majority so thoroughly disciplined, it will be readily imagined that they drew largely on all who had need of their support in aid of special measures, and such was the case. In short, judging from appearances, there seems almost to be warrant for the assertion that the Wisconsin Legislature of 1875 was a legislature run by a secret organization.

The situation is one which every citizen who is not intoxicated with the possession of power to which he is unused must regard with grave concern. The credit of our State, which was already crippled, has received another blow. With money cheap and plenty in commercial centres, our borrowing power is completely paralyzed. Under wise and temperate legislation, its recovery would be at the best but a slow process, and, judging from present indications, it is a long look ahead to the time when this course of treatment is likely to be entered upon.

F. R. L.

Eau Claire, Wisconsin, March 10, 1875.

---

[The above confirms all the comments and predictions we have ever offered on this subject, and we commend it to the attention of all investors at home and abroad. We assure them they cannot safely put money into *any* enterprise, private or corporate, in the State of Wisconsin, or lend it on any security accessible to legislation. The spirit at the bottom of the Granger legislation is, in fact, one of sheer and simple dishonesty.—Ed. Nation.]

# Notes.

J. B. FORD & CO. send us Vols. I. and II. of 'Knight's Mechanical Dictionary,' ending with *Pan*. We have more than once referred to the progress of this valuable publication, which is not only remarkably comprehensive, but as fresh as our author's long service in the Patent Office can make it. As every American is at some time in his life an inventor, a work like this ought to find a place beside his Webster or Worcester.——The American Public Health Association is not yet a household word, but that it is not a mere name is abundantly shown by the handsome volume of reports and papers presented at its meetings in 1873 (New York: Hurd & Houghton. 8vo, pp. 563). We cannot even enumerate here the topics discussed, mostly by first-rate authorities. Among the illustrated articles are General Walker's "Relations of Race and Nationality to Mortality in the United States"; the very curious "History and Course of the Epizootic" on this continent in 1872–73, by Dr. A. B. Judson; the same writer's "Report upon the Course of Cholera in the Mississippi Valley"; Dr. J. C. Peters's "Origin and Spread of Asiatic Cholera"; Dr. J. M. Toner's "Reports on Yellow Fever"; "Sanitary Climatology," by Lorin Blodgett; and Dr. Van der Poel's "Experience and Requirements of Quarantine."——The last illustrated paper in the foregoing work, "On the Sanitary Chemistry of Waters," with reference to the supply of cities, is by Dr. C. F. Chandler, and is accompanied by a map of the Croton water-shed. We are reminded by it of the second official report of Mr. Verplanck Colvin on his topographical survey of the Adirondack wilderness, which has just come to hand. To this region, in all probability, New York and many of the cities along the Hudson will eventually resort for an unfailing water-supply. Mr. Colvin's narrative is as readable as a magazine article, and is made intelligible by a great variety of engravings and maps.——Robert Clarke & Co.'s 'Catalogue of Books Relating to America' fills 130 well-printed pages, of which 22 are devoted to the sub-heading, "Rebellion and Slavery." An index greatly enhances its usefulness (Cincinnati).——The Harvard School of Geology, the analogue of the Anderson School at Penikese, is announced to open at Cumberland Gap, Tenn., on the 1st of July, under the direction of Professor N. S. Shaler. He will be assisted by his colleagues on the Geological Survey, and by members of the State Survey, of Kentucky, and probably also by Dr. Asa Gray, and Professors J. D. Whitney and Raphael Pumpelly, of Harvard. Teachers only (male, and not to exceed twenty-five in number) will be received in this camp. Applications should be addressed to F. W. Harris, Cambridge.——Macmillan & Co. have in press a work in two volumes, by Mr. A. R. Wallace, possessing a high degree of interest. It is on the 'Geographical Distribution of Animals.'——James Miller will reprint Miss Frances Power Cobbe's 'Hopes of the Human Race, Here and Hereafter.'——Scribner, Welford & Armstrong are reprinting, by special arrangement with the English publishers, translations of Paul Lacroix's 'XVIIIe Siècle' and Baron Davillier's 'L'Espagne,' with all the illustrations. Scribner, Armstrong & Co., by a similar arrangement, reprint Louis Rousselet's 'L'Inde des Rajahs.' They have just issued Leslie Stephen's 'Hours in a Library,' which we need not introduce again to our readers, and, from the stereotype plates, Craik's 'Compendious History of English Literature and of the English Language from the Norman Conquest,' in two volumes.——Benj. F. Burr, Ludlow, Mass., announces a volume relating to the history of that town and its centennial celebration last year.

—The *Portfolio* for March opens with a fine etching by Rajon from Giorgione's 'Knight in Armor' in the National Gallery. The series of photogravures from Greek coins is continued, giving some of those admirable Syracusan medals whose cutting is to numismatics what the art of Phidias is to sculpture. A rather flattering article on Bouguereau, by a fellow-countryman of the artist, is illustrated too in photogravure, the example being from one of the pseudo-classical figures of this too elegant painter. The editor, Mr. Hamerton, reviews some etchings, and the article on technical method describes the processes of Holman Hunt. The only symptom in the number that is not quite reassuring is the tendency to lessen the proportion of etchings and increase that of the clever photograph-prints, thus substituting "inspired chemistry" for "artistic inspiration." The American publisher is Mr. J. W. Bouton, No. 706 Broadway.

—Ninety-nine water-color sketches by Blake have been received by Mr. Bouton, and are for sale. Our libraries and art-museums should look to it that the series in its completeness be retained in some one of our appropriate institutions. These drawings are in various stages of finish, in different methods, on sheets of several hues. In each case the tint of the paper is cleverly used to save trouble in elaborating the effect. On a slight preliminary examination, we observe the originals of most of the illustrations to Swinburne's Essay, some of those of Blair's 'Grave,' and various motives copied by Mr. Gilchrist. The variation on Stonehenge, the corpse and bat-like figure, and several others employed by Mr. Swinburne, are recognizable, as well as the compositions he admires so much of couples rushing into embrace from the midst of flames or the hearts of flowers; the Leviathan; and the pair, resembling Adam and Eve, who are engaged in adoring a god apparently in a state of conflagration. The young man crouching for a flight as he surmounts the tomb (Blair's 'Grave') is seen in more than one study. We may casually speak, as instances of power or originality, of the group on a torn sheet, depicting Job and his

comforters; of a sort of female Prometheus stretched on a cloud, the vulture busy at her soft bosom; angels adoring the chalice, or else saying grace before celestial food; a seraph darting through clouds, holding a great pair of balances; the well-known inverted figure of a herculean spirit blowing a trumpet; and Leviathan, dominated by a woman, child and babe, who ride on its folds in triumph. The pictures in question are understood to be those from which the late Mr. Hotten prepared his fac-similes, and are released to sale, in all probability, on account of circumstances connected with his death.

—Part I. of the 'Allgemeine Deutsche Biographie' comes to us from F. W. Christern, the first instalment of a great work to embrace a hundred parts or twenty volumes, and to be completed in ten years. This is not an enterprise due, as might be supposed, to the new-born spirit of German unity, but one proposed as early as 1868 by Ranke and Döllinger, and unanimously adopted by the Historical Commission of the Bavarian Academy of Sciences, under whose auspices the 'Biographie' at length appears. Its scope is confined to departed greatness, but not to German soil alone. All Germans, not among the living, who have been eminent in church and state, science and art, trade and manufactures, or in other ways, will be recorded here, whether they happen to have been born within the present German Empire, or in Austria, Switzerland, the Netherlands (down to 1648), or the Baltic provinces of Russia. The issue before us extends from Aa to Ahlefeldt, and occupies 160 pp. A rough comparison of the biographies with those contained in the new Brockhaus indicates a proportion of three to two in favor of the 'Biographie,' which of course is able to treat of them more at length than would be possible for the former. What is most striking, however, is a comparison of the contributors engaged upon these two dictionaries. Those of the 'Biographie' number about 380, against about 120 in Brockhaus's employ, and it is hardly to be believed that only ten names occur on both lists, which fairly bristle with Prof., Dr., and Prof. Dr., together with high functionaries in the civil service, etc., etc. As this is actually the case, however, it is even safe to infer that a third enterprise of similar character and magnitude would find plenty of savants to recruit from besides the 500 just reckoned; and a more splendid tribute to the higher education of Germany could hardly be imagined. In the field of national biography the Germans have hitherto been behind their neighbors, both great and small, but this self-imposed task of seventeen years will have changed all that.

—An esteemed contributor sends us the following extracts, which he professes to have taken from the London *Academy* of February 29, 1875: "In his answer to the well-merited castigation which we recently administered to the transatlantic archæologists, Mr. Trumbull actually commits a pun implying the equivalence of *mālum* and *mālum*. When will American scholars learn to pay due regard to quantities? Are the members of the Oriental and Philological Societies really any better than the bank officer of whom we read in the same paper, who, his salary being only $5,000, out of heedlessness of quantity took $50,000?" We confess that we have not found these words in the *Academy*, in fact that no issue for the date specified has reached us; but we are obliged to add that the extract bears every internal evidence of being a genuine one; for it is quite in accordance with that paper's way of judging and commenting on all matters connected with the "Cardiff giant." Through the particular pair of eyes by which it has looked at this subject, the usually clear-sighted *Academy* has not seemed able to get sufficiently distinct and unprejudiced views to do justice either to things or to persons. It never fairly reported our original account of the discussion in the Oriental Society, nor let its readers see the aspect of the question as there presented; and it has spent its strength mainly in finding something to carp at in unessential attendant circumstances. We hold over here that the statue was years ago, and in the most public manner, declared and proved a forgery; that after making a fortune for its clever perpetrator, it has sunk into deserved neglect and contempt; that it never had any qualities to engage the credence of cautious scholars; and that American scholars have been and are agreed in condemning it. There is, to be sure, one man upon the opposite side; and his industrious distribution of his own communications in those learned and authoritative journals, the *Galaxy* and the New Haven *Palladium*, appears to have been the means of taking in certain too incautious and credulous foreign scholars. But to require that the question be reopened on his appeal and settled anew is equivalent to demanding that the Copernican theory be taken up again for serious discussion because some notoriety-seeking individual with a maggot in his head chooses to declare himself a Ptolemaist. There is no question that Professor Schlottmann and Dr. Hartogh, in dragging before the learned of Europe at this late day what we have truly called a "long since exploded humbug," have committed a grave oversight, for which they deserve to be sharply taken to task; and we have information that some of their colleagues heartily agree with us in this opinion.

—The death of Sir Arthur Helps will be widely regretted in this country, for his writings were of a sort to awaken a strong feeling of personal regard for their author. The quality of his thought, no less than of his style, was essentially that of a gentleman. No books exhibit more clearly than his the religion of the best modern society—the religion of self-respect, of personal refinement, of humanity, and the good breeding which puts all men at ease. His mind was not one of remarkable strength or remarkable subtlety, but his intellectual perceptions were delicate and well trained, and his sympathies, both moral and intellectual, were wide and keen. He was, altogether, a civilized, cultivated, social man of letters, and the topics that especially interested him were those which concern men in their social relations. His reputation as a thinker will rest mainly on his discussion of what are called social questions. On these topics his thought, if not always profound, was fresh and acute, the product of large experience, extended observation, and deliberate reflection. He had a firm faith that no great revolution is required to make the lives of men much more cheerful, much happier, than they now are; that what is required is attention to the means already at hand, and the application of remedies great part of which are in possession of every individual. He was no perverse optimist, but he had the conviction that the good in the world might be indefinitely increased by simple means, and his best writings are those in which he sets forth this faith, and illustrates and recommends it with the skill begotten of generous warmth of feeling. The keynote of the first of his books that became well known, his 'Friends in Council,' published almost thirty years ago, is struck again in the last of his writings, his book on 'Social Pressure,' which appears in this country simultaneously with the announcement of his death. The better organization of society, the improvement in the condition of the poor, the application of the standard of private morals to the conduct of public affairs—these are the matters to which, in various form, he returns again and again. His humane and liberal spirit pervades his books. Against slavery, war, neglect of the poor, cruelty to animals, and many another manifestation of human brutality, he directed his efforts with unrelaxing energy. But no bitter words ever fell from his pen. He recognized the virtue of self-possessed force, and he never wasted his strength in controversy or lost his temper in impatience with wrong-doers.

—His essays will be long remembered and more read than his other books. He had not an imagination of sufficient force to make him a poet, and his novels and tragedies are the performances of talent rather than the creations of genius. His style was the reflection of himself, always clear, always pleasant, and at its best rising to heights of vigorous animation and full-flowing ease of expression, which give him just claim to a place among the best modern masters of English prose. No books will hereafter afford to the student of the thoughts and sentiments of the best English society of the last thirty years a truer acquaintance with them than 'Friends in Council,' 'Companions of my Solitude,' and the other volumes of the series of essays and conversations of which they were the first. The delightful personal characteristics which his books in part reveal endeared Sir Arthur Helps to a wide circle of friends. Mr. Emerson, in his 'English Traits,' has recorded his visit with Carlyle to Mr. Helps, as he then was, at his home in Bishops Waltham. A few years later, an enterprise in which he engaged, with the hope of benefiting others as well as himself, resulted so ill as to involve the loss of his ample property and the giving up of his home. In 1859, he was appointed Clerk of the Privy Council, an office of responsibility and of labor. This office he retained till his death. In 1872, he was made Civil Knight Commander of the Bath, in recognition of his various services to literature and the state. Misfortune did not break or embitter him, but it saddened his later years. He still made the best of life; he remained one of the most agreeable of men in society; always kindly in judgment, always desirous to promote pleasantness, and possessed of such culture and such gifts as made him master in his favorite art—the art of living with others.

—Some few years ago the crime of garroting became so rife in England that the punishment of flogging was revived, and it has now been on trial for some years in that country. The Home Secretary has recently asked the judges of the Superior Courts to say whether in their opinion the revival of this obsolescent punishment has proved successful, and whether it ought to be extended to a class of cases which have of late years become almost as common as garroting formerly—those of aggravated assault. The opinion of the judges is almost unanimous that flogging has proved its value a

a punishment; that the fear of it has upon the minds of brutal malefactors a powerful deterrent effect which nothing else has; that garroting was actually brought to an end by it, and that the general sum of human happiness, at least in Great Britain, is sensibly increased by the occasional administration of a couple of dozen lashes "well laid on" the backs of a certain class of the community. From this argument, however, two or three of the judges dissent, maintaining that flogging is an objectionable punishment. That there should be a difference of opinion on the subject is not remarkable, but the arguments by which one of the minority, Mr. Justice Keating, supports his position are worth attention. This judge says, first, that he has himself never sentenced any one to be flogged under the provisions of the act as to garroters, a fact which would seem to deprive his opinion of the weight given by actual experiment to that of the others, but which he mentions as if he considered it in itself an argument against the punishment, and then says that flogging is unequal in its application—a number of lashes which would make one man faint being taken by another with comparative indifference; that it hardens the offenders; that it has no deterrent effect, because "nine-tenths of the crimes of violence committed throughout England originate in public-houses, and are committed under circumstances which exclude all reflection"; that men in the army and navy have been constantly flogged for repeating the same offences, and that he himself, having to follow at Leeds a flogging judge, found the number of cases had considerably increased. The peculiarity of these objections, as has been pointed out in England, is that, so far as they have any force, they apply to all punishment short of death. With regard to the increase of cases after the tour of the flogging-judge, we cannot tell whether the garroting did not become more lively because the garroters got wind of the approach of a non-flogging judge. With regard to all the other objections, they apply to locking a man up in a cell, to forcing him to work with other convicts in gangs, to depriving him of his liberty in any way, and indeed to any punishment short of hanging.

—We printed last week a notice of the first two volumes of 'Records of the Past, being English Translations of the Assyrian and Egyptian Monuments, published under the Sanction of the Society of Biblical Archæology.' The third volume of the series has just come to hand. It contains further translations of Assyrian texts, embracing some of the principal historical and other documents found in the cuneiform inscriptions. "The materials of this volume, like the preceding, have been prepared by different Assyriologists with great care, and those which have appeared elsewhere have been carefully revised and corrected or retranslated." The greater part of the volume is occupied with translations of inscriptions relating the deeds of kings—royal annals, in fact, which contain much that illustrates the social conditions, the arts, and the beliefs of the ancient people. The most curious of these inscriptions are two which relate to Esarhaddon, the son of Sennacherib, and one of the greatest of the kings of Assyria. The first, which is unfortunately imperfect, narrates his proceedings after hearing of the murder of his father—a deed recorded in the Second Book of Kings, xix. 37, and in Isaiah xxxvii. 38. It is an interesting illustration of the narrative in the Bible. The second contains, among other things, a detailed account of the building of the great palace of the king, and is a record of considerable importance for the information it affords concerning Assyrian art. Esarhaddon lived in the seventh century before Christ, and in reading this account of his palace and its splendors, deciphered from the inscription on a hexagonal prism of baked clay, which was found near Nineveh, one can hardly fail to be impressed with the contrast between the transitoriness of the stout and stately edifice, called from its splendor "The Palace which rivals the World," and the durability of the little, fragile hexagon of clay which tells us all we know of it. As Sir Thomas Browne says: "Time, which antiquates antiquities, and hath an art to make dust of all things, hath yet spared these minor monuments. To be unknown was the means of their continuation, and obscurity their protection." The volume contains also an Accadian Liturgy, and some very curious specimens of Assyrian sacred poetry, exorcisms, and charms. The well-deserved success of this series is, we are glad to learn, so great, that a second volume of translations from Egyptian texts and a third volume from Assyrian texts will appear next July. The exceedingly moderate price at which the volumes are sold brings them within the means of all but the starving scholar.

—Dr. John Muir, of Edinburgh, has printed for private circulation, as forerunner and sample of a larger work on which he is engaged, a little brochure of 'Religious and Moral Sentiments, freely translated from Indian Writers.' The translations are in verse, Dr. Muir having shown himself in various ways before a versifier of no mean power in Sanskrit as well as in English. In an appendix he gives his sources, with a literal version of each verse or passage, and with explanatory remarks. A preface discusses the general question of the relation of Indian ethics and their expression to Christian morality and doctrine; and in it the author shows his usual good judgment and sound appreciation of what we may call the principles of comparative religion by arguing against and rejecting the wild and foolish views put forth some years ago by Dr. Lorinser as to the derivation of passages in the Bhagavadgîtâ from Christian sources. It will be long, of course, before men will learn to distinguish accurately between derivations and independent parallel expressions of a common human sentiment; but, except where the cumulative evidence of borrowing is very plain, scepticism as to its existence is by far the safer side to take. We have, it may be added, in Böhtlingk's 'Indische Sprüche,' an immense collection of aphorisms in Sanskrit, on religious and moral as well as other subjects, each with a literal German version subjoined. With an index added (it is arranged alphabetically), it would be—indeed, it is already—a most valuable mine for all interested in such subjects to dig in. Didactic poets innumerable might draw their texts from it.

## SPANISH REFORMERS.*

THE history of the Reformation in Spain yet remains to be written. McCrie's 'Reformation in Spain,' De Castro's history of the Spanish Protestants, and the work now under consideration, are valuable contributions to the subject, but, from the very nature of things, incomplete or partial. Spanish books on all topics are scarce, and, as may be supposed, the Inquisition has done its best to destroy all those relating to the great religious movement of the sixteenth century. So effectually has this been done, and so loud are the Spaniards themselves in their boasts of freedom from heresies against the Romish Church, that many are ignorant of the fact that the Reformation awakened a powerful echo in Spain. The latest Spanish historian, Lafuente, himself a most zealous Catholic (vii. 36, 2d ed. 'Hist. de España'), in speaking of Charles the Fifth and his wish expressed at Yuste that every means should be employed to uproot the growing heresy, remarks:

"If the Emperor's life had been prolonged but a little while, the inquisitorial zeal which he displayed in his latter days would have been satisfied by seeing the Inquisition prosecute so many persons illustrious by their high offices, learning, or family, so many archbishops and bishops, abbots, priests, monks, nuns, marquises and great lords, magistrates, professors, high functionaries of the state, together with tradesmen, artisans, servants, and common people. He would have seen subjected to an inquisitorial process the Archbishops of Granada and Santiago, the Bishops of Lugo, Leon, and Almeria, and distinguished theologians who had shed renown on Spain and the Catholic Church in the Council of Trent. He would also have seen denounced and prosecuted on suspicion of Lutheranism the Primate of the Spanish Church, the Archbishop of Toledo, Bartolomé de Carranza, confessor of Philip II., who had consoled the dying moments of the Emperor at Yuste; and with him he would have seen prosecuted all the prelates and theologians who had approved his 'Comments on the Catechism of Christian Doctrine.'"

This extract from a Catholic writer will show, perhaps, how important the subject is, and how deserving the attention of students of the Reformation. As has been stated in the outset, the book before us is not a complete history of this period, nor does it aim to be. The circumstances under which it was written are somewhat peculiar and interesting. Benjamin Barron Wiffen was born, in 1794, of an English Quaker family. His elder brother was the J. H. Wiffen favorably known by his translations of Tasso and Garcilaso de la Vega. In 1839, Benjamin became acquainted with a Spanish gentleman, Luis de Usóz y Rio, who had become interested in a translation of Barclay's 'Apology,' and, knowing that J. H. Wiffen, the translator of Garcilaso, was a Quaker, resolved (should he go to London) to find him out, and learn more about the Society of Friends. When he came to London, he learned that J. H. Wiffen was dead. The surviving brother heard of the enquiries the Spanish gentleman had made, and called upon him. This chance acquaintance ripened into a lifelong friendship, and entirely changed the tenor of Wiffen's life. In 1839 he went to Spain with his friend G. W. Alexander, in order to promote the effectual abolition of the slave-trade and slavery. He made another visit on the same errand in 1843. His niece says in her memoir:

"On this visit he became still more intimate with his Spanish friends, and yet more deeply interested in all that related to Spain, her literature,

* 'Bibliotheca Wiffeniana. Spanish Reformers of Two Centuries from 1520. Their Lives and Writings, according to the late Benjamin B. Wiffen's Plan, and with the use of his Materials. Described by Edward Boehmer, D.D., Ph.D., Ordinary Professor of the Romance Languages in the University of Strassburg. First Volume. With B. B. Wiffen's narrative of the incidents attendant upon the republication of 'Reformistas Antiguos Españoles,' and with a Memoir of B. B. Wiffen by Isaline Wiffen.' Strassburg and London: Trübner. 1874.

and her martyrs for the truth. From this period his literary pursuits gradually assumed a definite form, and the discovery by him of the 'Alfabeto Christiano' of Juan de Valdés (which had been lost for the last three centuries), led to the restoration and reprinting of the various and unknown writings of that author, as well as of numerous other valuable religious works, which furnished a delightful and interesting study, and became for twenty-five years the absorbing interest of his life."

During this time Wiffen was indefatigable in the collection and copying of the works of the early Spanish reformers. This material he placed at the disposal of his friend Luis de Usóz y Rio, who employed it in the series entitled 'Reformistas Antiguos Españoles' (Madrid, 1847–1865, twenty volumes). He died soon after the last volume was published, and Wiffen did not long survive his friend, dying in 1867. It had been his hope for many years that Don Luis would compile a manual of the lives and works of the Spanish reformers from the time of Erasmus. This hope was blighted by Don Luis's death, and Wiffen was obliged to depend henceforth upon himself, he being then upwards of seventy years old. He was prevented by death from completing this work, but left considerable material for it Edward Boehmer, the well-known German scholar, was then requested to prepare for the press the bibliographical notes and memoirs left by Wiffen. This task has been executed in a masterly manner, and the work will be indispensable to those interested in the literature of the Reformation.

The first volume, the only one yet issued, contains a memoir of Wiffen by his niece, a narrative of the incidents attendant upon the republication of the 'Reformistas Antiguos Españoles,' the memoirs of Alfonso and Juan de Valdés, Franzisco and Jaime de Enzinas, Juan Diaz, and an admirable bibliography of their works. The memoirs of the early Spanish reformers are full of interest; as has been hinted at the beginning of this notice, we shall find among them names of those high in church and state. The first one mentioned by Wiffen, Alfonso Valdés, was an Imperial Secretary of State under Charles the Fifth, whom he accompanied on many of his journeys, and on one of them he became acquainted with Melanchthon and other reformers. Among his works is an interesting letter on the sack of Rome, written to vindicate the Emperor and to prove that terrible catastrophe to have been a retribution upon the sins of the Papal city. Alfonso died in 1532 of the plague at Vienna. His twin brother, Juan, had more leisure for his literary labors. He did not feel safe in Spain, and established himself permanently about 1533 at Naples, where he wrote his masterly 'Dialogue on the Language' (*i.e.*, the Spanish), a work of high authority. Among his pupils and friends was the beautiful Julia Gonzaga, for whom he wrote his 'Christian Alphabet,' and to whom he dedicated a translation of the Psalms, now unfortunately lost. He also dedicated to the same person commentaries on Romans and First Corinthians. The text he translated himself, and to him belongs the honor of being the first person to undertake a translation of the Bible from the original languages into Spanish. Valdés's most important work, however, is his celebrated 'Hundred and Ten Divine Considerations,' which work was translated by John T. Betts, Wiffen's intimate friend, and edited by the latter with an exhaustive life of the author (London: B. Quaritch. 1865.) Valdés died in 1541, enjoying to the last the friendship of the most distinguished Italian divines, who saw no fault in his life or writings.

The next mentioned reformer is Francesco de Enzinas (who changed his name after the prevailing fashion into the Greek form Dryander), the author of the first complete translation of the Bible, which he dedicated to Charles the Fifth. The Emperor's confessor threw difficulties in the way of its publication, and caused the translator's imprisonment. He escaped, however, was for a time a guest of Melanchthon, travelled much, and became professor of Greek at Cambridge. He did not remain there long, and died at Strassburg in 1552. His brother Jaime embraced the doctrines of Protestantism, and was burned at Rome in 1547.

The final memoir is that of Juan Diaz, chiefly known by his tragical death, which created an intense excitement all over Europe. He became a Protestant at the University of Paris, whither he had gone in 1539 to study theology, and afterwards settled in Switzerland. His elder brother Alfonso, employed in the court of the Rota at Rome, heard of his change of religious views, and immediately started for Ratisbon, accompanied by a man who had formerly been an executioner. The brothers met at Neuberg, and Alfonso used all his endeavors to persuade Juan to return to the Romish Church or to accompany him to Italy. Failing in his efforts, he departed and returned the next morning with his satellite, who, with an axe purchased for the purpose the day before, killed Juan Diaz as he was reading a letter from his unnatural brother. Alfonso was arrested at Innsbruck, but afterwards, on the Pope's demand, sent to Rome. It does not appear that he was ever punished; at all events, he was at liberty a few years afterwards and in Spain. It is some satisfaction to know that Alfonso's conscience was not so easy upon this matter as some others. He hanged himself at Trent in 1551.

We shall look with interest for the next instalment of this valuable work, which will doubtless throw more light upon the progress made by the reformed doctrines in Spain.

---

*Manual of Political Ethics*, designed chiefly for the use of Colleges and Students at Law. By Francis Lieber. Two volumes. Second edition, revised. Edited by Theodore D. Woolsey. (Philadelphia: J. B. Lippincott & Co. 1875.)—In taking up this new edition of Dr. Lieber's well-known work, we have only to repeat the expression of regret to which we gave utterance when noticing the 'Civil Liberty' last June—that the editor, Dr. Woolsey, should not have taken a broader view of his duties, and should not have made full and frequent additions to the notes. We say this as much in the interest of Dr. Lieber's memory as in that of the generation of students which is now using his books; for there is hardly a page of this one which would not bear copious illustration from the history of the thirty-seven years which have elapsed since the appearance of the first edition. There have not been many periods, if any, in modern history so fruitful in experience. We do not say so eventful, be it remarked, but so fruitful in experience. There may have been other periods in which more startling occurrences and more widely-felt changes have taken place, but there has been none of the same length in which the value of so many political theories has been put to the test, and in which so many opinions on important political problems have undergone revision in the light of actual facts. In going through Dr. Lieber's book, therefore, with recent history fresh in one's memory, one might, considering the number and variety of the topics he discusses, and the distinctness with which, in addressing young men, he is compelled to express himself, fairly expect to light upon a large number of disabled arguments and falsified anticipations. But nothing in the book is more remarkable than the way in which his positions have stood the test of subsequent experiment and elucidation. We have looked carefully for passages which the recent advances in historical criticism and sociological research, or the political experience of this country or of Western Europe, might have deprived of their value, and we confess we have not found one. This is as striking a proof as we could offer of the soundness of Dr. Lieber's ethical speculations, of the general accuracy and variety of his learning, and of the acuteness of his political sense. He was essentially a healthy-minded man. He stood squarely on his feet on the solid earth, and his book therefore wears as few books or none of the kind have ever done.

If, therefore, the editor had found time, or had deemed it a part of his duty, to apply the author's maxims and predictions to the events even of our own country during the last twenty years, he would not only have greatly increased the value of the book for political students, but have given additional lustre to Dr. Lieber's reputation. We trust some one may be found hereafter willing to undertake this task; whether anybody of equal competency will be found is more than doubtful. Of the value of just such an application of Dr. Lieber's lessons there can unhappily be little question. A generation has come on the stage since the outbreak of the Civil War which has lost its hold on many of the most valuable traditions of Anglo-Saxon politics, and which has learnt to set but little store on many of the ethical foundations which the men of an earlier time deemed essential to the national safety and welfare. Reading Dr. Lieber amid the discussions of our own day is like drinking at the old fountains from which those who conceived the great fabric of Anglo-Saxon liberty drew their inspiration.

The fault of this book, as of Dr. Lieber's other works, is discursiveness. His memory was very tenacious, his reading very wide, and his store of illustration very rich. The temptation, therefore, to ramble in the byways of a various learning he was very apt to find irresistible. That this has, however, ensured the attractiveness of his works for the class for which it was intended we have little doubt; that it has somewhat diminished their weight as scientific works is, in these days of rigid classification and precise definition, perhaps also true. But if Dr. Lieber had had more capacity for scientific arrangement he would probably have had less success as a preacher. A more taking guide through the tortuous paths of political casuistry no young man could have. He touches nothing without throwing a light on it drawn from many periods and many nations; and then his sympathy with all the nobler emotions of human history, and his hatred for everything which can darken or debase it, are so hearty and genuine, that in listening to him one almost wonders that goodness and purity have had so hard a battle to fight.

---

*Social Pressure.* By Sir Arthur Helps, K.C.B. (Boston: Roberts Brothers. 1875.)—This volume from the pen of Sir Arthur Helps, the

news of whose death has just come to us, is a characteristic and agreeable last bequest of its author. It belongs to the somewhat voluminous series of 'Friends in Council,' of which the philosophy is not very deep, but, so far as it goes, very clear and very sound; the gayety, the humor, rather mild, but very constant, and in perfectly good taste. It is genial common-sense and intelligence, a trifle diluted, but not fatally so, applied to what we may call episodical questions—secondary questions, questions by no means trivial, but not of the first importance. The number and variety of the questions which Sir Arthur Helps touches upon are very great; he has remarkable fertility of suggestion and invention. We must repeat, too, what we had occasion to say above, in our general characterization of him and of his works, that, if his sense is of the more strictly common-sense category, his style is decidedly above the common.

"If you ever make use of our essays and lucubrations," says one of Sir Arthur Helps's interlocutors, "take this as your title to them: 'Social Pressure.' It is vague, sounds important, does not tell too much, and, at any rate, it keeps clear of politics. You need not say from where the pressure comes; each reader will suppose that it comes from himself." "I have often dared to think," says another, "what an advantage it would be to this country if Parliamentary discussions were put aside for two or three years, and the attention of the country were directed to administration. . . . Do you not agree with me that there is an enormous deal to be done in those branches of human effort which have nothing whatever to do with the redistribution of political power, with theological matters, or with any of those questions which are abundant in strife, and which produce very little improvement for the great masses of mankind?" The topics discussed by the "Friends" are for the most part chosen in accordance with this suggestion, although many of them are of a simply ethical sort. "That towns may be too large," on the one hand, and on the other hand that they may not (we ourselves, much as we like an immense city, incline, on the author's showing, to the former view); that it should not be an invariable fashion that offices of state be occupied by men who have been in Parliament; that England should by all means keep hold of her colonies; that the horror of "paternal government" may be overdone; that "never is paternal government so needful as when civilization is most advanced"—these are some of the subjects on which the intelligent little circle imagined by Sir Arthur Helps exchanges opinions, with a certain humorous, dramatic friction. It strikes out more sparks from these quasi-practical matters than when it falls to moralizing, to discussing "Ridicule," "Over-publicity," "Looking Back in Life." But, on the whole, it is very pleasant company, and most readers will regret that we are not to meet it again.

---

*Architecture for General Students.* By Caroline W. Horton. With descriptive illustrations. (New York: Hurd & Houghton. 1874. 16mo, pp. 287.)—This little volume is the work of a person of some reading and some intelligence, but with not enough of either for the difficult task she took upon herself. The book shows that its author has no real acquaintance with the subject with which she deals. It is full of confusion of ideas and of metaphors. Take for example the following sentence: "Then [*i.e.*, in the early part of the XVIIIth century] began the great fermentation which culminated in a general revolution in 1848, has produced the abolition of slavery in America, and is still going on, but we trust with such accumulation of force that it may be able to untie the remaining knots of social and political life rather than resort to Alexander's method of severing them" (p. 240). Facts often fare but little better than figures with the writer. On the same page—we need not go further for an illustration—it is said: "In 1752, James Stuart began to publish the result of his labors in 'Athenian Antiquities,' while in 1796 Winckelmann gave to the world his wonderful 'History of Art.'" But the real facts are that in 1752 Stuart was still at Athens, and the first volume of his book was not published till 1761. Winckelmann's 'History of Art' appeared in 1764. On the next page there are more mistakes. In fact, the book seems as untrustworthy as it is superficial. It is not worth while exhibiting its defects at length.

# Fine Arts.

## MADAME RISTORI.

WITH due recognition of the fact that Madame Ristori has entered into the final twilight, as we may call it, of her brilliant career, her appearance is yet incomparably the most important theatrical occurrence of the winter. Nothing that we can at present produce from our own resources is worthy of even a minute share of the consideration which people of taste feel prompted to offer this great foreign artist. One would rather this were not so; but so unfortunately it is. Madame Ristori's return to America is marked by circumstances not especially conciliatory. She is making, professionally, the circuit of the civilized world, and her *impedimenta*, of all kinds, have been selected with an eye to light weight. She reappears, too, after having bidden us farewell with some solemnity—an act in which there is always a certain awkwardness. But Madame Ristori, as an actress, is before all things stately, and her stateliness surmounts the disadvantage of a superlatively shabby *mise en scène*, a meagre company, and a somewhat surprised welcome. She apparently—probably very wisely—confines herself to a limited round of characters, and she offers us only one part in which she has not hitherto appeared. Fortunately, the parts left in her repertory are the strongest ones, and those which have done most to make her famous. She is indissolubly associated with the picturesque stage-figures of Medea and Mary Stuart, and though the strong coloring of these representations has suffered somewhat from the chill of years, they keep their place, in all essentials, among the most accomplished pieces of acting of our time. There are, indeed, things in each of them which it is safe to say the stage has never seen surpassed. Those who remember Madame Ristori twenty years ago may be conscious that here and there the execution drags a little; but young spectators should be assured that in witnessing the last act of "Mary Stuart," or certain of the great points in "Medea," they are looking at a supreme exhibition of the grand style of acting. No one whom we have seen, or are likely to see in this country, can interpret tragedy in the superbly large way of Madame Ristori—can distribute effects into such powerful masses. The abundance of her natural gifts makes the usual clever actress seem a wofully slender personage, and the extreme refinement of her art renders our most knowing devices, of native growth, unspeakably crude and puerile. Madame Ristori has the fortune to come of the great artistic race—the race in whom the feeling of the picturesque is a common instinct, and the gift of personal expression so ample that, even when quite uncultivated, it begins where our laborious attempts in the same line terminate. Coming thus of a pre-eminently expressive and demonstrative race, and watched by a peculiarly undemonstrative and impressive public—a public among whom gesture, inflection of voice, and play of feature are comparatively unknown—it is natural that Madame Ristori should seem very often to exaggerate, to grimace, to tear a passion to tatters. It is very possible, too, that playing so much in foreign countries, to audiences ignorant of her language—audiences for whom the meaning is to be driven home *vi et armis*—has had the effect of imparting to the whole method of the actress a coarseness against which the constant presence of a really critical public would have been a protest. Unfortunately, the most artistic race in the world is not able to pay largely for its pleasure, and Italian actors and singers are almost of necessity wanderers and exiles. This fact, if one reflects upon it, gives a rather melancholy background to one's admiration at the Lyceum just now. Of course, Madame Ristori, making the "farewell tour of the world," acquires fame on an immense scale and, on a somewhat commensurate scale, it is to be hoped, that grosser profit for which it smooths the way. But surely, looking at the thing the least bit from the ideal point of view, there is an essential dreariness in this great artist's expending her powers so exclusively upon populations for whom half of them are of necessity wasted. Between herself and her audience there is a gulf—a gulf which she certainly bravely does her

best to overleap, and which is kept open by no ill-will on the spectators' part, but by the inexorable difference of race, of language, of national temperament. She is judged altogether from the outside—from a distance; and as she sweeps to and fro through all the variations of her art, she seems hardly more than a sort of magnificent curiosity. The "nature" that she represents is not the nature of the house.

But Madame Ristori's great merit—a merit that abundantly covers her defects, such as they are—is one that is perhaps especially appreciable here. She has *style*. The quality is so rare upon the English-speaking stage—especially, it is painful to observe, among the actresses—that one should make the most of any suggestion of it. It is the result in Madame Ristori of a combination of fine elements—her admirable stage presence, her incomparable language, and the peculiarly *masterly* way—the firmness, the certainty, the assurance—with which she deals with her part. Her Mary Stuart is full of style; the whole manner in which the part is "composed" to the eye is one of the great things of the stage. The intellectual conception, we think, is not particularly elevated; it is the natural woman simply—the woman of temper, the woman who talks loud, who struggles, hates, revenges, who is quite untouched by what Matthew Arnold calls "sweet reasonableness." But the part is superbly worn, and the last act is rendered as no one but Madame Ristori could render it. The expression of dignity here reaches a great height. No one but Madame Ristori could manage the farewell to her weeping servants, could gather the group about her, and handle it, as one may say, with that picturesque majesty. It is realism, especially in the closing moments, of a downright pattern; but it is realism harmonized by a great artistic instinct. Madame Ristori's "Elizabeth" is, in a manner, her *cheval de bataille*, but we have never liked the part. There are wonderfully skilful things in it, and it is an extraordinary piece of elaboration; but it is a thing made, as we say, for uncritical publics, painted with a big brush to be seen at a distance. It is better liked, probably, in New York than in Paris; it will be better liked in San Francisco than in New York, and it will make a *furor* in Australia. The objections to Madame Ristori's "Medea" are obvious; the lady is too much of a termagant—no wonder poor Jason would not go back to her. But the part is a dense tissue of superb action, and there are strokes in it—of tone, of attitude, of gesture, of facial play—any single one of which would make the fortune of a slighter artist. In "Lucrezia Borgia," which Madame Ristori plays now for the first time in America, she has not found, to our sense, a very happy opportunity. The part is a hideous one, and it has the drawback that its climax, in its pursuit of the terrible, very distinctly grazes the ludicrous. We have heard it said that the way she plays it is a proof of enfeebled vigor. It seems to us, on the contrary, that she renders it with an energy quite adequate to its demands for vehemence, but that her acting is rather wanting in *finesse*. In the long scene with the Duke, in which there is a fine chance in the way of high comedy, she has some masterly touches, but the whole thing strikes us as too high pitched, and, here and there, as rather roughly executed. We should say, too, that the last words of the play, when Lucretia has been stabbed by her son—"Gennaro, I am thy mother!"—would, as constituting its tragic consummation, be much more effective if delivered standing—discharged at him with passionate reproach. But these are details. In a general way one goes to see Madame Ristori with a serene certainty of observing a dramatic temperament of unsurpassable power, seconded by a language which gives to speech a lovely dignity, independent of its meaning.

JUST PUBLISHED.

Boston, Mass.

# The Reader.

THEOLOGICAL TREATISES.—'CHRIST AND OTHER MASTERS,' BY ARCHDEACON HARDWICK.—'HISTORY OF THE CANON OF THE NEW TESTAMENT,' BY DR. WESTCOTT.—'THE CHRISTIAN CALLING,' BY DAVIES.—THE GOSPELS NEWLY TRANSLATED BY MCCLELLAN.

The Ven. Archdeacon Hardwick, in his work on 'Christ and Other Masters,' has made a careful examination of the religions of Egypt, Medo-Persia, India, and China, and even of America and Oceanica, with a special reference to Christianity, and to the question whether the Jewish and Christian faith is original or derivative. A more elevated and generous estimate of the old heathen priestcrafts has seldom been made, while the triumphant superiority of Christianity emerges with new clearness from the temperate comparison The time has gone by when it is necessary, for the vindication of Christian faith, to treat with scorn the efforts of those who founded the primitive and uninspired religions, to cast opprobrium on their expressive myths, and call by the incorrect name of "stone gods" the symbolic images which were rather the literature and demonstration of their creeds. The grandeur of idea underlying the religions of India and Egypt could hardly be better expressed by Indian or Egyptian priests in person than it is by the author, yet their waning importance when brought up to Christianity for contrast is shown in clearest terms. The Ven. Archdeacon begins with a lucid exposition of the unity of our race, and a review of modern religious tendencies, introducing logically the grand historical tableau of moral development which forms the body of the work. Only a bold scholar would undertake so vast a study of comparative ethics; only a skilled reasoner and a practical Biblist could gather this study in his hand and hold it forth as a testimony to the incomparable superiority of Christian teaching.

The 'History of the New Testament Canon' is examined by Dr. Brooke Foss Westcott, and seems to be exhaustive, as far as so vexed a subject can be exhaustively presented. The sifting of the mass of gospels and epistles, which claimed equal rank in the early centuries of our era, has been a work on which the greatest minds of the church have anxiously labored. The books now collected in our Testaments as Canonical are the result of all this labor, and in most cases their claim is clear, as against those which have been rejected as apocryphal. But our present age of fierce critical activity has sifted the whole matter over and over again with incredible acumen, and the labors, not only of sceptical but of orthodox philosophers, have given fresh interest to a general review of this work of selection. Every manuscript, every copy, every interpolation and mistranslation is now the matter of a new theory of Christianity on the part of some German student or native schismatic; the learned patience with which so many knotty points are examined is a great credit to Dr. Westcott, and the book he has written is a real aid to the theologian who is obliged to combat in the sceptical warfare of the time. The author's fourth edition gives him opportunity to discuss the animadversions of his critics in a new and interesting Preface.

'The Christian Calling' is the collective title given to some recent sermons delivered at Scarborough and other places by Rev. J. Llewellyn Davies, author of a number of theological books which have excited the attention of Christian readers. Ten of the sermons included in this course form a continuous series on the twofold aspect of the distinctive Christian virtues, towards God and towards mankind. The other dis courses are more practical, while hardly less theoretical, and deal in a fresh and helpful way with the daily besetting difficulties of this modern life of ours. Sometimes, as in discussing the question whether certain Pharisaic types of the nineteenth century congregation would not do better to stay away from church, and whether the wealth, energy, and inventive activity of the age are not irreconcilable with the Galilean spirit, the writer shows wonderful boldness and originality; but it is an admitted fact that we like best the sermons which give the greatest shock to our complacency.

A labor of vast difficulty and industry, a new translation of the Testament, has been undertaken by Mr. John Brown McClellan, M.A., and the first volume, ending with the Gospel of St. John, is published by Macmillan & Co. The author of this version discusses, in abundant notes and appendices, the grave difficulties of his task, and the matters considered in his remarks are such as to arouse again in the liveliest manner the many vexed questions about New Testament meanings and discrepancies. Sometimes the translator finds it impossible to satisfy himself, as when he renders the celebrated and unique word ἐπιούσιον by "needful"—"needful bread"—while confessing that he has not been able to find a full equivalent. Mr. McClellan gives proof of learning and diligence, and his translation, kept as close as possible to the King James version, will interest the general reader, while the discussions in his notes will attract the Biblical scholar.

# MACMILLAN & Co.'s PUBLICATIONS.

**Books for Clergymen, Theological Students, and other Readers of Religious Literature.**

*THE NEW TESTAMENT OF OUR* Lord and Saviour Jesus Christ. A new translation on the basis of the Authorized Version, from a critically-revised Greek Text, newly arranged in paragraphs, with analyses, copious references, and illustrations from original authorities; new chronological and analytical harmony of the Four Gospels; notes and dissertations. A contribution to Christian Evidence. By John Brown McClellan, M.A., Vicar of Bottisham, Rural Dean of North Camps, and late Fellow of Trinity College, Cambridge. In two volumes. Vol. I. The Four Gospels, with the Chronological and Analytical Harmony. 8vo, pp. xcii., 763, price $12.

*A GENERAL SURVEY OF THE* History of the Canon of the New Testament. By Brooke Foss Westcott, D.D., Regius Professor of Divinity, and late Fellow of Trinity College, Cambridge, Canon of Peterborough. Fourth edition (1875), with a new Preface on 'Supernatural Religion.' Crown 8vo, $3 50.

*A GENERAL VIEW OF THE HIS-* tory of the English Bible. By B. F. Westcott, D.D., etc. Second edition. Crown 8vo, $3 50.

*AN INTRODUCTION TO THE* Study of the Gospels. By B. F. Westcott, D.D., etc. Fourth edition. Crown 8vo, $3 50.

*THE BIBLE IN THE CHURCH.* A Popular Account of the Collection and Reception of the Holy Scriptures in the Christian Churches. New edition. 18mo, $1 25.

*CHRIST AND OTHER MASTERS.* An Historical Inquiry into some of the chief differences, parallelisms, and contrasts between Christianity and the Religious Systems of the Ancient World. By the Venerable Archdeacon Hardwick. Third Edition. Edited, with Memoir, by the Rev. F. Proctor, M.A. Crown 8vo, $3.

*THE APOSTOLIC FATHERS:* A Critical Account of their Genuine Writings and of their Doctrines. By James Donaldson, LL.D. Crown 8vo, $3.

*THE CHRISTIAN CALLING.* By the Rev. J. Llewellyn Davies, M.A., Rector of Christ Church, of Marylebone. Extra fcap. 8vo, $1 75.

*BOY-LIFE:* Its Trial, Its Strength, Its Fulness. Sundays at Wellington College, 1859–1873. By G W. Benson, Master. Crown 8vo, $2 50.

*THE FALL OF MAN,* and other Sermons. By the Rev. F. W. Farrar, M.A. Second edition. Extra fcap. 8vo, $1 50.

*CATHOLIC REFORM* By Father Hyacinthe. Letters, Fragments, Discourses. Translated by Madame Hyacinthe-Loyson. With a Preface by Dean Stanley. Crown 8vo, $2.

*WESTMINSTER SERMONS.* By the Rev. Charles Kingsley, M.A., late Rector of Eversley, and Canon of Westminster. Popular edition. Extra fcap. 8vo, $1 50.

"The prominent characteristics of these sermons are, freshness of thought, boldness of expression, a clear and sometimes powerful presentation of the living truth, a desire to establish a connection between the Gospel and the world's present needs, and to make men see that God as a real personal being now governs and works in his universe."—*The Churchman.*

*SERMONS PREACHED AT MAN-* chester. By Alexander Maclaren. 3 vols. fcap. 8vo, each $1 50.

"Vigorous in style, full of thought, rich in illustration, and in an unusual degree interesting."—*Spectator* (*London*).

*BIBLE TEACHINGS IN NATURE.* By the Rev. Hugh Macmillan. Eighth edition. Extra fcap. 8vo, $2.

*PROPHETS AND KINGS OF THE* Old Testament. By the Rev. F. D. Maurice, late Professor of Moral Philosophy in the University of Cambridge. Crown 8vo, $3 50

*SERMONS PREACHED IN COUN-* try Churches. By the Rev. F. D. Maurice, M.A., etc. Crown 8vo, $3 50.

"Earnest, practical, and extremely simple."—*Literary Churchman* (*London*).

*A Full List of the Works of the late Professor Maurice may be had on application.*

*SERMONS PREACHED FOR THE* most part in Ireland. By R. Chenevix Trench, D.D., Archbishop of Dublin. 8vo, $3 50.

*THE CHURCH OF THE FIRST* Days. By the Rev. C. J. Vaughan, D.D., Master of the Temple. First Series, 'The Church of Jerusalem,' fcp. 8vo, $1 25. Second Series. 'The Church of the Gentiles' (new edition, 1875), fcp. 8vo, $1 25. Third Series, 'The Church of the World,' fcp. 8vo, $1 25.

"These sermons are worthy of all praise as models of pulpit teaching."—*British Quarterly Review.*

*SERMONS PREACHED IN THE* Chapel of Rugby School. By F. Temple, D.D., Bishop of Exeter, late Head-master of Rugby. 3 vols., extra fcp. 8vo, each $1 50.

**New Books on Various Subjects.**

*THE LIFE AND LETTERS OF BI-* shop Patteson. By C. M. Yonge, author of 'The Heir of Redclyffe.' Third and cheaper edition, with two portraits. 2 vols., crown 8vo, $5.

*THE STORY OF A FELLOW-SOL-* dier. An Account of the Life and Missionary Labors of the Rt. Rev. John Coleridge Patteson, D.D., Bishop of the Melanesian Islands. By Frances Awdry. With six Illustrations. Globe 8vo, $1 50.

*THE STATESMAN'S YEAR-BOOK* for 1875. A Statistical and Historical Annual of the States of the Civilized World. Hand-book for Politicians and Merchants. By Frederick Martin. (Twelfth Annual Publication.) Revised after Official Returns. Crown 8vo, $3 50.

"The 'Year-book' has become one of the institutions of the country. We find no fault in it this year."—*Athenæum, Feb.* 27, 1875.

*L. VON RANKE'S HISTORY OF* England, principally in the Seventeenth Century. Translated from the German. 6 vols. 8vo, $24.

"This work of a veteran historian, whose fame is European, is worthy of his reputation."—*Athenæum.*

*A SUMMARY OF MODERN HIS-* tory. Translated from the French of M. Michelet, and continued to the present time, by M. C. M. Simpson. Extra fcap. 8vo, $1 75.

*A SHORT HISTORY OF THE ENG-* lish People. By J. R. Green, M.A., Examiner in the School of Modern History at Oxford. With Chronological and Genealogical Tables and Colored Maps. Cr. 8vo, $2.

"We know of no record of the whole drama of English history to be compared with it. We know none that is so distinctly a work of genius. . . . Mr. Green's volume is a really wonderful production. There is a freshness and originality breathing from one end to the other, a charm of style, and a power, both narrative and descriptive, which lifts it altogether out of the class of books to which at first sight it might seem to belong."—*Pall Mall Gazette* (*London*).

*PRIMER OF ENGLISH GRAM-* mar. By the Rev. R. Morris, M.A., LL.D., President of the Philological Society, author of 'Historical Outlines of English Accidence.' 18mo, cloth, 40 cents; paper cover, 30 cents. (Forming the first volume of a new series of history and Literature Primers. Edited by J. R. Green, M.A.)

*BRITISH WILD FLOWERS,* Considered in Relation to Insects. By Sir John Lubbock, Bart., M.P., F.R.S. With numerous illustrations. Crown 8vo, $1 50. [Nature Series.

*SCANDINAVIAN HISTORY.* By E. C. Otté. With Maps. Globe 8vo, $2 50.

*THE METHODS OF ETHICS.* By Henry Sidgwick, M.A., late Fellow of Trinity College, Cambridge. 8vo, $4.

"This excellent and very welcome volume."—*Athenæum.*

*THE THREE DEVILS*—Luther's, Milton's, Goethe's. With Other Essays. By David Masson, M.A., LL.D., Professor of Rhetoric and English Literature in the University of Edinburgh. Crown 8vo, $1 75.

**THE LATEST NOVELS.**

*THE HARBOUR BAR.* A Tale of Scottish Life. 12mo, paper, $1.

"Bright, picturesque, and true to life. . . . The story is readable and pleasant from first to last, growing in interest as it proceeds, and everywhere showing that the author is really at home in all the vivid scenes which she describes."—*The Standard* (*London*).

"The writer knows the Scotch people, and in handling the characters which belong to the little fishing village, the events are made so consonant with the proper elimination of the story that the scenes become deeply interesting without any apparent attempt at dramatic effect."—*Sunday Times.*

"Upon the working out of Elsie's character, the author has expended the more labor, and with good results, too; for rarely in fiction is there to be met with a more perfectly finished picture of a true-hearted, unselfish woman. . . . The description of the terrible catastrophe of the storm on the Harbour Bar is perfect in its graphic vigor and intensity."—*Morning Post* (*London*).

*GOVINDA SAMANTA;* or, The History of a Bengal Raiyat. By the Rev. Lal Behari Day. 12mo, paper, $1.

"The work before us is not only excellently conceived and well-written, but it deals with topics which, if familiar to Indian administrators, are to the English reader as novel as the incidents in 'Uncle Tom's Cabin.'"—*Saturday Review* (*London*).

"Unique in its way, a simple narrative, wonderfully complete, and intensely realistic."—*Athenæum.*

*FOR THE KING'S DUES.* By Agnes Macdonnell. 12mo, paper, $1.

"A book with simple scenes, unvarying in interest to the close."—*N. Y. World.*

# The Nation.

*NEW YORK, THURSDAY, MARCH 25, 1875.*

## The Week.

THE Senate has ratified the Hawaiian treaty, with some slight modifications, by a vote of 51 to 12 (thus practically establishing free-trade between the Islands and the United States), and postponed the Pinchback case till December, by a vote of 33 to 30. This last was a surprise to the public, and it is said also to some of the senators who voted for it. The Republican chieftains, who had forced the matter upon the Senate's attention in an unnecessary way, at an extraordinary session, convened for other purposes, taking the ground that unless Pinchback was recognized rapine and carnage would desolate the South, were very much startled when Senator West sprang a resolution for postponement upon them, and they were constrained to vote for it as a party measure. It is said by the *Tribune* correspondent that the object of the move was to put the Pinchback case off till after the operations of the "New York Legislature" (*i.e.*, the Louisiana Legislature as rearranged upon the compromise adopted by the Wheeler Committee, which has been sitting in New York) have been brought to an end, it being expected that the remodelled Louisiana Legislature will elect a Conservative senator, and that the Senate will then have to decide between Pinchback and an out-and-out bandit—a prospect which is supposed to create a very troubled future for such Republican senators as are trying to see their way clear to supporting Grant and the Wheeler compromise and the party, and at the same time giving their own behavior the appearance of consistency. It is one of the remarkable features of the Louisiana case, we may observe, how much of its government is carried on "in foreign parts." The returns of the election of 1872 have been ever since, we believe, in Kentucky; the headquarters of the civil government have been generally in the saddle or at Washington; and for the last week or two the legislative returns have been undergoing examination in a private office in New York. We should not be at all surprised at hearing of some branch of it as having turned up in London or Vienna. The Wheeler compromise, it is understood, is now complete, and it practically places the State exactly where it was in November, with Kellogg Governor, a Democratic House, and a Republican Senate. The House Committee, by the way, on the expenditures of the Department of Justice, has reported that the officials of the department in various parts of the South have got up many frivolous cases, "no doubt to make business for the purpose of getting fees"—a practice which accounts, of course, for many of the "outrages" and much subsequent perjury.

Andrew Johnson has, as was foretold, made his speech in the Senate on the Louisiana question, and it is the kind of speech that might have been expected. He is one of the class of orators who are excited by the sound of their own voice, and who, therefore, when they once begin talking, do not know what they will say before they have done. He was very violent throughout, very extravagant in some places. He objected, and justly, to the resolution pending in the Senate, as *ultra vires*, and cited the Jackson precedent in support of his position, and the Tennessee case against the President's use of the military in Louisiana, and went fairly wild over the third term. "The empire," he says, "is ahead," and the government of the country is now what he calls a "stratocracy." He quoted Cato somewhat effectively, and, after much rambling and many outbursts of patriotic devotion, sat down, but not without having revealed a knowledge of the principles of constitutional government which it were to be wished his successor possessed. The speech showed clearly, however, that Mr. Johnson is never more to be an influence in national affairs, and he will probably "swing round the circle" as long as he has health.

The Senate debate on the Louisiana case has come to an end in the adoption, by a vote of 33 to 23, of a resolution introduced by Senator Anthony in the following terms: "*Resolved*, That the action of the President in protecting the government in Louisiana, of which William P. Kellogg is executive, and the people of that State, against domestic violence, and enforcing the laws of the United States, is approved." This resolution, as the Cincinnati *Commercial* points out, is merely declaratory as to the fact that Kellogg is Governor, and laudatory only so far as the President's acts in the past are concerned. What the friends of the President wanted to have passed was the Frelinghuysen resolution, approving the President's past course, and declaring the opinion of the Senate to be that he "should continue to recognize" the "existing government," though for how long a time was not mentioned. It was found, however, that the Republican Senators could not be brought up to this point. The resolution is, as Senator Thurman says, very "thin gruel," and the reason why the Republicans have taken so much pains to pass it, is no doubt that they hope to be able to use the minority vote as a renewed proof that the Democrats are in favor of "domestic violence" and opposed to "the enforcement of the laws." One of the curiosities of the final vote was the behavior of Senator Christiancy of Michigan. In the first place, he explained that he was going to vote for the resolution; but he did not regard it as an endorsement of Kellogg or of "the means by which he succeeded to power." On a proviso, however, introduced by Senator Thurman, that Kellogg should not be recognized as Governor *de jure*, he declined to vote. On the whole, the honors of parliamentary strategy in the matter are pretty evenly divided.

Notwithstanding the recurrence of winter weather, general trade continues to improve, and the feeling among merchants is that the spring business will be satisfactory, even if not so large as before the panic. There is no doubt that what remains unsold of the crops of 1874 will bring higher prices than have yet obtained. Within the last day or two there has been a halt in the upward movement of breadstuffs and provisions. Cotton continues strong, with the receipts at the ports small. There are few who now estimate that the crop will come up to 3,750,000 bales, even among those who last autumn and in the early winter were positive that it would exceed 4,000,000 bales. There have been two mercantile suspensions of importance, one in the tea and coffee trade and the other in the sugar trade; the latter proved but temporary. Both these branches of trade have been injured by the fast-and-loose action of Congress in regard to taxing these articles. In London, two concerns involved in the affairs of J. C. Im Thurn & Co. have suspended, but, as was the case with Im Thurn & Co., their failure seems to have been expected. Certainly, the Bank of England took no notice of them, and money in London is easier than a week ago. In Wall Street the gold clique have been content with such profits as could be made in turns within 115⅝ and 116¾, and have mercifully refrained from distressing borrowers of gold. They still, however menace the gold and exchange markets and foreign trade interests. At the Stock Exchange choice investments, like Government and the selected railroad bonds, have advanced. Stocks have also advanced under the lead of Union Pacific, which is up above fifty. It is well understood that the speculation in this stock is conducted by Jay Gould, and yet he has a following, both in and out of Wall Street, which is surprisingly large. The money market continues very easy for demand loans and discounts; the banks added $2,250,000 to their surplus reserve last week. Railroad earnings, except those of the trunk-lines engaged in war, are increasing, which is a good sign for general business.

Mr. Tilden's message on the canals shows that the income from tolls for five years from October 1, 1869, to September 30, 1874, was $15,000,000; that the ordinary expenses were more than $9,000,000; and the apparent surplus therefore between $5,000,000 and $6,000,000. The "extraordinary" repairs, as they are called, amounted however to nearly $11,000,000, making the actual deficiency $5,000,000. Besides, we must add to this other payments enumerated

by the Governor, for interest and other expenses, and the actual deficiency, exclusive of the reduction of debt, is brought up to the sum of $8,769,757 62. If we extend the enquiry so as to embrace the payment of the debt, the figures become still larger, and the sum-total of taxes levied during the five years is found to be $14,789,848 25, all of which has been directly or indirectly for the benefit of the canals. The Governor then proceeds to analyze the causes which have led to these vast expenditures, and finds that they have come from the contracts made by the State for the maintenance and repair of the canals. The constitution of the State provides that all contracts for work or material on any canal shall be made with the lowest bidder who gives adequate security. This requirement was intended of course as a protection to the State, but, "by artful bids, and in some cases by fraudulent combinations, it is made an instrument to defeat the very end had in view by its authors." Mr. Tilden says that he has himself examined more than a hundred contracts (and there is no one who is more expert in examinations of this kind), and finds that most of them are so contrived that they do not go to the lowest bidder, and that the State pays from two to four times the amount of the contract.

The *modus operandi* is as follows: When a contract is to be let, the engineer makes for the State an estimate of the quantity and kinds of work to be done. The bids are then put in, and as they generally amount to little more than one-half the engineer's estimates, it looks as if the State had made an advantageous contract. But on examination there turns out to be this peculiarity in the bids—the prices for the several items bear no relation whatever to their supposed value; one contractor offering, for instance, to excavate earth at eighty-five cents a yard, and another at one cent a yard; bids for "slope wall" being put in, in some cases, at twenty cents, and in others at two dollars. In some cases a contractor puts in proposals on the same day for different jobs, in which the prices for the same kind of work or materials vary several hundred per cent. These bids, which are on their face fraudulent, and are known as "unbalanced bids," have always, till recently, been accepted. The explanation of them is that the contractor finds out, by collusion, what work and material will actually be needed, and what will not. For the latter he bids at ridiculously low rates, and for the former at extravagantly high ones. Besides this, he gets the contract changed by "influence," so as to let him spend as much as he wants to. As a specimen of this sort of work, the Governor gives a contract, which the contractor undertook at $2,000, and which cost the sum of $28,000. A quantity of these contracts have been published in the *Tribune*. Indeed, since the appearance of Mr. Tilden's message, the press has become more licentious and unbridled than ever, and during the past week has been engaged in blackening the character of "Jarv." Lord, Willard Johnson, and some others of the most prominent and influential of our public men.

There is one branch of the operations of the Canal Ring which Mr. Tilden leaves unexplained—that is, how the contractors arrange among themselves to whom the contracts shall be awarded. Obviously this must be done, for one man can make an "unbalanced bid" as well as another. The way it is done, however, is very simple. To obtain a contract, it is not only necessary that your bid shall be low, but that it shall comply with certain regulations as to interlineations, erasures, the security given, etc. If, therefore, any contractor can get hold of all the bids for a certain piece of work, and then deface all but his own, so as to make them illegal, it is obvious that when the bids are opened his will be the lowest legal bid, no matter what the others are. Now, this was actually done in the case of a number of contracts let in 1866 (the ring in 1866 was composed of the same men as now). The contractors met at Albany, hired a room, and, having found out beforehand what work would really probably be required, sold the various contracts at auction, the highest bidder having the exclusive right to the possession of all the bids, so that he might mutilate and deface those in competition with his own, and then hand them in to the contracting board in this condition, the money obtained from the auction being divided among the contractors. The reader unaccustomed to fraud will perhaps enquire, how did they get the bids into their possession at all? Simply by going in a body to the office of the contracting board, in whose hands they were, and asking that the bids might be withdrawn and put in later, as more time was needed for *competition*. This auction took place in Albany at Stanwix Hall, and a very full account of it, and a good many more astounding matters connected with canal management, may be found in a report of a Senate committee, which as long ago as 1868 declared the system to be reeking with corruption. The evidence taken at that time constitutes one of the worst exposures we have ever had the pleasure of reading, and would be worth republication by some public-spirited and licentious newspaper now. Mr. Tilden, among other recommendations, advises the immediate abandonment of the lateral canals by the State, as provided for by the recent constitutional amendments.

In the matter of weather, it is unsafe to say that anything is unprecedented, but the memory is certainly taxed to recall any winter season in which the ice-production, owing to prolonged rather than to extraordinarily severe cold, has been so prodigious and so formidable. The spring break-up began in the Delaware Valley, above Port Jervis, to which public attention was specially directed on account of the importance of that place to the Erie Railroad; and for the first time, we think, an attempt was made scientifically to blow up the dams and gorges which annually obstruct many of the great northern rivers and their tributaries. Thanks to these precautions, the actual losses in the Delaware Valley have thus far been less than was apprehended, though another freshet is inevitable. In the Wyoming Valley, on the north branch of the Susquehanna, and along that river from Columbia to Port Deposit, Maryland, great damage has already been inflicted by ice and water, and yet the worst is evidently to come, at least for the coal region about Wilkesbarre, where the river even threatens to change its course permanently. The phenomena we are now witnessing are, in fact, truly glacial in kind and in extent. Of scientific observers of them we do not hear, but curiosity leads troops of sightseers to the scene. The losses occasioned, or certain to take place, by the destruction of bridges, houses, railroad tracks and equipage, canals, lumber, farms, etc., etc., will, without exaggeration, be reckoned by millions. Great fears are entertained for the safety of the towns, particularly Williamsport, on the west branch of the Susquehanna.

The Tilton-Beecher trial apparently grows in interest, though we doubt much whether the better portion of the public cares now so much for the issue before the jury as for the light which the evidence throws on the morals and manners of a certain class of our fellow-citizens. What may be called the nastiness of the case has been increased greatly by the fact that the nature of the defence, which consists in a countercharge as well as a denial, necessitates the infliction on us of two dirty stories instead of one, which was all we at first looked for. The theory of the defence is that Tilton invented the accusation against Mr. Beecher, and that he conspired with others to use it as a means of forcing Mr. Beecher to help him out of difficulties into which he was plunged by his own misconduct. The evidence of the defence thus far has been directed almost exclusively to showing that Tilton was in difficulties, that his life was immoral, and that he did try to use certain charges against Mr. Beecher as a means of retrieving his fortunes; the question whether these charges are true has, however, hardly been touched upon, and will not be in all probability until Mr. Beecher himself takes the stand, and, owing to their nature, he will have to fight them almost alone. Supposing all the testimony which has thus far been produced against Tilton to be true, the main question still remains untouched, because the hypothesis that Tilton is mean or lewd or brutal or extorted money, even if maintained, does not exclude the hypothesis that his

wife had been led astray, though it does doubtless tell in mitigation of damages, by showing that he lost nothing by what he in the Brooklyn dialect calls "the invasion of his home." It does, too, contribute in some degree to the support of the theory of conspiracy. The evidence has been all along remarkable as a picture of social and religious life, and its interest has been heightened by the practice of the plaintiff's counsel in making the witnesses give autobiographical sketches in cross-examination.

The odd contrasts of chromo-civilized life have been brought out very strikingly, for instance, in Bowen's position. He has evidently been mixed up in the scandal for years, and, it would appear by the "Tripartite Agreement," did circulate dirty stories about Mr. Beecher, and he has been solemnly accused in open court, by Beecher's counsel, as a party to a most horrible conspiracy against his own pastor. Nevertheless, *pendente lite*, he still retains one of the most conspicuous pews in Plymouth Church, where he sits on Sundays, with upturned, docile countenance, listening to the pastor aforesaid, whom he has lately hinted in a published card that he (Bowen) would ruin by his evidence if called upon.

Governor Chamberlain of South Carolina has been discovering that he is far in advance of the Legislature on the subject of reform. The State has a "floating debt" of considerable amount, contracted under the Moses régime, and made up of all sorts of fraudulent claims, but especially of claims for "legislative expenses," for nobody charges so much for "legislating" as carpet-baggers and their confederates. One could make up a legislature composed of the principal jurists of the civilized world, and pay them the most extravagant salaries on the monarchical scale, and yet have the laws made cheaper, by far, than Louisiana or South Carolina or Arkansas can get them made by a parcel of ignorant white adventurers, aided by a few colored barbers, porters, and caterers. Since the session of 1870–1, South Carolina has paid, on account of "legislative expenses," the enormous sum of $1,661,000, and there are still claims outstanding, under the same head, of $500,000 out of a total floating debt of $883,000. Although the honest and valid debt of the State has not yet been settled on any permanent and satisfactory basis, the attention of the present Legislature has been mainly concentrated on the floating debt; and lately, under much pressure, Governor Chamberlain consented to a plan, in accordance with which three Commissioners were to be appointed by the Governor to audit all these claims, and all those which they passed were to be reduced one-third in amount. This was the most that the State could, he thought, agree to do, considering its present financial condition and the character of these liabilities. The Legislature thereupon embodied this plan in a bill, which was passed by the House, but the Senate, being more knowing, inserted the names of the Commissioners, and to this amendment the House promptly agreed. The Commissioners thus chosen, we need hardly say, are not persons of whom the Governor can approve—so he has vetoed the bill; but the legislators pretend that he kept it so long in his hands that it has become a law without his signature. We shall only add that the taxes for the present year bid fair to be enormous. We do not know how Governor Chamberlain's contest with these people will end, but we can assure him of the sympathy of honest people all over the Union, as one who is really defending civilization itself against barbarism in its worst form. That he is, however, guilty of "intimidation" we do not deny.

Dr. Kenealy has made his début in the House of Commons, and not without tact and the success which comes of tact. He called another member to account for assailing him in an electioneering speech, held his own against the objections to his bringing the matter before the House with good temper and moderation, raised only one great laugh by declaring that he would shake off a certain slur "as the lion shakes the dewdrops from his mane," and sat down with a declaration, which called forth an approving cheer, that he would show before many months had elapsed that he did not deserve the existing prejudice against him, and "he trusted he would never do anything which should make a single member of the House of Commons ashamed of his presence." His companion in Parliamentary opprobrium, John Mitchel, has, in the meantime, relieved the House of Commons of a discussion of considerable difficulty by dying after a second election for Tipperary. The Irish societies in this country as well as at home have been honoring his memory by magniloquent recognition of his "services" to their national cause, though what the services were it would be hard to say; the discredit he brought on the Irish name is, unhappily, patent enough. His career furnishes a striking illustration of the dangers of rhetoric uncontrolled by good sense, a good conscience, and sound mental training. He discovered his powers in that direction when first beginning, with fair prospects, the practice of an honorable and useful calling, which he thereupon abandoned and became a writer for the press; and he was really a master in the art of expression, and might, if he had had the qualities above-named, have rendered great service to various good causes as a journalist. But his eloquence speedily made him drunk, then mad, and he became a raging blatherskite, who spouted all over the world, without convincing anybody or appeasing anybody, or throwing any light on any of the problems by which human society is vexed. It is a most melancholy story, which we commend to the attention of our correspondent "R." and to that of all young men who are studying elocution. In fact, we think if a good rabid temperance tract were taken, the word "rhetoric" might not inappropriately be substituted in it for "alcohol."

Nothing very new has occurred in France since the formation of the Ministry, and all speculation as to its policy seems to support the theory that it will occupy itself between now and the dissolution of the Assembly with establishing, as far as it lies in its power, the new régime on a firm basis. The establishment of the Republic has been formally acknowledged in the *Journal Officiel*, which now always speaks of Marshal MacMahon as the "Président de la République"; but the event has produced none of the old enthusiasm out of doors, which is an excellent sign, as it shows that the French public at last begins to see the real gravity of great political changes, and to feel the necessity for something besides cheers and processions and trees of liberty to make them successful. Moreover, it is reported that the workingmen do not quite believe in the existence of the Republic as yet, and there is more or less suspense among all classes pending the election of a new Assembly, in which the Radicals expect to have things entirely their own way. The Left in the Assembly are, therefore, very anxious to bring about the dissolution as soon as possible, and call for it now in six months, but the probabilities seem to be that it will not take place until about this time next year. Whenever it does take place, it will, thanks to Marshal MacMahon, be attended with no disturbance, and the new election will, for the same reason, be peaceable and orderly. The Radicals, who are the only persons likely to make trouble, are bound to peace by the now well-recognized fact that all disorder helps the Bonapartists.

A ministerial crisis which has lasted for some weeks in Hungary, has come to an end by the formation of a new one by a combination of Conservatives and Liberals—the Conservatives having, by a curious combination of circumstances, been led to surrender to the Opposition and admit them into their ranks. The new Cabinet is headed by Baron Wenkheim, a moderate man not lately in office, though in charge of the Department of the Interior some years ago, which Tisza, who has long been the leader of the Opposition, now takes. M. Szell takes the Finance Ministry, though the only difference between him and the late incumbent, M. Ghyczy, in the debates which led to the crisis, was that he was opposed to an income-tax of four per cent., though not to the total amount of direct taxation which the Ministry proposed to raise for the present year—$65,000,000 in all. In the new combination, some kind of compromise on this point is to be tried. The new finance minister is the friend and pupil of Deák.

## RESPONSIBILITY IN HIGH PLACES.

WE share very fully in the satisfaction which the news of Judge Christiancy's succession to Mr. Zachariah Chandler's place in the Senate has given to the lovers of good government all over the country, and this satisfaction was greatly increased, we believe, by the report of his first speech. It was not long, and it was very temperate. It went to the heart of the matter. He pointed out, what cannot be denied, that the Kellogg legislature, from which Pinchback claims his title, was "a pretended legislature," not a legislature of the government of the State of Louisiana, but "a body set up, installed, and kept in power, and imposed upon the State by the Executive Department of the Federal Government." He went on to say that if what occurred in Louisiana when this legislature was set up was justifiable there, it would be justifiable in any other State, and he then added:

"This might occur in any State, as well at the North as in the South. Suppose it had occurred, as it might, in Michigan, at the last election, and, owing to the heated passions of the partisans on either side, and the frauds committed at the election or in canvassing the votes, a similar difficulty existed in determining which candidate was elected; and, while the dispute was still open, and neither candidate for governor had obtained possession of the office, a district court of the United States had assumed jurisdiction of the question in the same or any other way, and to decide who was elected, and undertaken to decide upon the election of members of the legislature, and the President had sent the military to enforce this decision of the Federal court, and to place in power and sustain the candidate in whose favor the court had decided. While the people of Michigan might not object to the action of the military in preserving the lives of citizens against insurrection and violence, would they be likely to recognize the validity of the government thus imposed upon them? Would they be likely quietly to submit to it? The people of Michigan are a law-abiding people, but I know them well enough to venture the assertion that it would take several regiments of soldiers to keep them quiet under a government thus imposed, and more than all the armies of the United States to make them love or respect it."

In other words, he declares that a monstrous violation both of the Constitution and of sound political principles was committed in Louisiana, which, if committed in his own State, would have driven it into armed resistance. One might naturally expect that this bold description of the facts would have led to a severe condemnation of the author of these proceedings, viz., the President. But it did not. On the contrary, it was prefatory not only to an absolution of the President, but to a eulogy on him. Judge Christiancy says that "he is as sure as he can be of anything which does not admit of mathematical demonstration, that the President had no wish or intention to usurp power that did not belong to him," but that, being called upon to "suppress apprehended violence and insurrection," and not having all the evidence before him, and "not having the best legal advice," he "did not see the true principle involved," and therefore erred, but erred innocently; and the proof of this the Judge finds, as others have found it, in the fact that he repeatedly called on Congress to make proper provision for the case, and thus take it off his hands.

Now, there are, as it seems to us, several very serious objections to this mode of dealing with the question. No more important duty devolves upon those who concern themselves with the government of a free state than that of fixing the responsibility of abuses on the right persons. Indeed, the duty of exposing abuses, important as it is, is by no means so important as the duty of saying who is to blame for them. Nay, we might go further, and say that the first without the last has no practical value at all, for however much we may be impressed with the sight of iniquity, unless we know who did it, or get some adequate notion of the motive which prompted it, we cannot take proper measures to prevent its repetition. It might almost be said that all political criticism in the United States, at this juncture, which does not concern itself with offenders just as much as with offences, is likely to prove futile, for two reasons: one is, that there is a strong tendency in politics to make a distinction between conduct and persons, just as there is in theology a strong tendency to make a distinction between sin and sinners; and thus, while visiting a man's acts with abhorrence, to treat the man himself with indulgence and even respect. But this mode of assailing evil is, we need hardly say, in practice utterly valueless. To say that there has been usurpation in Louisiana is a barren truth until you have pointed out the usurper. Then, but not until then, your exposure becomes useful. No reform would ever have been brought about in this world, if the plan of preaching against evil as an entity for which no person should be held accountable had been pursued. Going to jail for non-payment of ship-money did not secure the triumph of the principle that taxes must be voted by the taxpayers. It was secured by declaring boldly that the person who levied taxes without the consent of Parliament would be knocked on the head if necessary, and that the king was that person.

The second reason is, that in a democracy like ours all talking or writing about politics is and ought to be considered an educational process; and this view of it needs to be all the more closely kept in mind just now, owing to the fact that we have a large body of voters among us at present either very ignorant of or very unfamiliar with American political traditions, and whom it is hopeless to try to reach through dry statements of general principles. They have to be trained and enlightened, if at all, through criticism of prominent men and pending measures, because it is only for topics of this sort that their attention can be secured. Sound doctrine on all the leading questions of the time has to be brought home to them by the discussion of proposed legislation. True standards of capacity and fitness in public men have to be held up by the criticism of public men now on the stage; that is, not by essays on statesmanship, but by plain talk about Grant and Wilson and Blaine and Dawes. Now, this function of criticism is of course liable to abuse. We have of late heard a great deal about its abuse, though most of what we hear is an old story, which men in high places have been repeating ever since the invention of printing. The critics very often do not give good men their due, and very often paint the devil blacker than he really is; but we nevertheless maintain that even the criticism of the press, wild or malicious or corrupt though much of it may be, on the whole and in the long run either does substantial justice or fails to hinder it. But what it accomplishes openly and palpably in specific instances is only a small part of what it accomplishes, and by far the least valuable part. Out of the Babel of "charges," and counter-charges, and insinuations, and slanders, and vindications amid which every political campaign, and indeed every session of Congress, is carried on, one great lesson is brought home to the popular mind with a force in no other way attainable, and that is—that whether A be corrupt or not, corruption is dangerous and detestable; whether B lied or not, a liar is not fit for high public office; whether C be an embezzler or not, honesty is a necessity of good government; and what with accusations and denials, vituperation and retorts, an ideal public man is kept before us whom it may seem difficult to embody, but whom, nevertheless, it is well to have in our mind's eye.

Now, there is nothing in General Grant's character or career to exempt him from the ordinary conditions of official life in a free state. What was given him when he was elected President was not exemption from criticism, but the high honor of facing it in a conspicuous civil, as he had already faced it in a conspicuous military, station. He was made, in short, the greatest thing in the world, a responsible magistrate. In this position he was entitled, during the earlier years of his official life, to all manner of favorable presumptions. He had a fair claim to have his mistakes overlooked for a while, and have people's judgments on isolated acts, even when they were of doubtful complexion, suspended. But he was not entitled, and could never become entitled, to the presumption that he was not bound to learn by experience, and that even a long course of conduct furnished no materials for a judgment on his character. Nevertheless, this is what his friends have been claiming for him with extraordinary persistency ever since 1870. His appointments in the civil service, and his relations with members of Congress, proved in the ordinary way that his talk about civil-service reform was not the expression of real intention, because a

man's acts always explain his language—were it otherwise, human society could not hold together. Nevertheless, Mr. Curtis, and others of his supporters, persevered for two years in asking us to accept his private conversations and written messages as better indications than his conduct of what he was really aiming at, and he enjoyed similar good fortune in other things which space will not permit us to enumerate.

In this Louisiana matter we find ourselves face to face with a similar anomaly. Those who have supported the Presidential interference in that State, on the ground that the whites were ferocious and not to be trusted, were, we believe, mistaken; but we think their argument was a perfectly comprehensible one. They said they judged these men by experience of their past conduct. They refused to accept their vows and pretensions *now* as conclusive, but looked over the history of the last ten years, and finding, or pretending to find, in it a great deal of slaughter and outrage, declared that the perpetrators ought not to be relieved from restraint. Turning to the President, however, they applied a totally different rule. If we take the history of Federal interference in the State since 1869, we find no warrant whatever for Mr. Christiancy's confidence in the President. From the appointment of his brother-in-law Casey to the collectorship of the port, and Casey's use of the revenue-cutter to participate in the quarrel between two factions of Republicans without rebuke from Washington, down to the last interference with the organization of the legislature, the President's acts and omissions would, taken together, be set down in the case of any other man as positive proof of bad designs. Take, to begin with, his want of "good legal advice." Who is responsible for that? Who appointed and who retains Williams? Is the President ignorant of Williams's standing in the legal profession? When Casey used the revenue-cutter to prevent the legislature's forming a quorum, it would have been proof, in any other case, that Casey ought to be removed, and that he and Packard had become chiefs of a faction. Later, when the Attorney-General telegraphed, on the 3d of December, 1872, his order to the troops to aid the marshal to execute United States writs, would it not in any other case have been taken as proof of guilty preparation for and connivance at the granting of the unlawful order by Judge Durell, on the night of December 5, directing the marshal to seize the State-house, which was done on the same night, and at the monstrous packing of the legislature on the 9th following by Packard with a military force? Does Judge Christiancy really mean to tell us that General Grant did not know what was going on, and did not know that it was wrong, and really believed that this was a proper mode of "suppressing apprehended violence and insurrection"? Does he mean to tell us that the President of the United States can commit, through pure mistake, acts which, according to Judge Christiancy himself, would justify, and in Michigan at least would produce, insurrection? Does he mean to tell us, too, that when, after all that had occurred, General Emory repeatedly telegraphed for instructions, in view of "apprehended violence" on the meeting of the legislature in January last, and those instructions were carefully withheld, the reticence of the President and Mr. Williams was a simple error of judgment? If not, what construction would he put on it if the Louisiana case came before him in court?

It ought to be observed, in reference to the defence on which the President's friends have relied a good deal—that he has repeatedly desired Congress to relieve him of the responsibility which he had rashly assumed in Louisiana, and had promised implicit compliance with its directions—that its value is dependent on the extent to which Congress is free from Executive influence or control. If, in other words, the President has scrupulously abstained from influencing its decisions in Southern matters, he may fairly throw on it the responsibility of his errors of judgment, but if not, not. Now, that he does seek to influence Congressional decisions, both by personal lobbying and by the use of his patronage, is one of the notorious facts of the day. He exerted himself strongly to get both the Force Bill passed and the Arkansas resolutions defeated, and he is now using the civil service to reward those who voted under his instructions. We must not, therefore, be asked to judge him as if the legislature were a body completely independent of him, and as if he had nothing to do with its acts or omissions. Nor must we be called upon to admire the submissiveness with which he bows to its decisions, because this is tantamount to asking us to applaud him for not committing impeachable offences, and it suggests the monstrous doctrine, of which unscrupulous men in the Presidential chair might make terrible use, that any excesses or usurpation perpetrated by the Executive during the recess, could be atoned for by remitting the matter to the decision of Congress when it met. In short, General Grant's conduct, like that of other men, must, in the interests of public morality and public safety, be judged by the ordinary tests used in the transaction of public and private affairs, and not by the fantastic fictions borrowed from monarchical jurisprudence.

## THE SORROWS OF CAPITALISTS.

IT is calculated that there are $500,000,000 of railroad bonds in this country which have ceased temporarily or permanently to pay their interest. Sir Henry James, in a curious statement made to the English House of Commons the other day, declared that the amount due by bankrupt governments reached the enormous total of $1,200,000,000, so that it may be said that the railroads and governments of the civilized world together owe to private persons at least $2,000,000,000, or a sum equal to our national debt, of which they pay neither principal nor interest; and the bulk of this, as might be expected, is due in England and Holland, but more particularly in England. In order to be able to make some organized effort for their own protection, these unfortunates formed a regular corporation, called the "Corporation of Foreign Bondholders," in London in 1873, managed by a council, and subdivided into committees charged with the pursuit of different classes of defaulters. The second report of the Council now lies before us, and it is amusing yet melancholy reading, for they have had to deal with every kind of fraud and default, from the impudence of barefaced knavery down to the inability of honesty poverty. Of Spain, we are glad to say, they give a good account. We have told in these columns the story of the trick by which Señor Camacho, the Republican Minister of Finance, evaded the arrangements with the state creditors entered into by his predecessor, Señor Echegaray. There are few worse incidents in the history of public finance, for he coolly walked off with certain mining and other securities which had been deposited as collateral for the bondholders, and then called upon the owners of the then unpaid coupons to bid against each other at a kind of Dutch auction for the lowest sum at which they would be willing to participate in the distribution of a portion of the money due. Since then, however, the bondholders have concluded a very favorable contract with the Government, and the first decree signed by the new king, Alfonso, was one providing for its execution.

Portugal they report as behaving well to its creditors, but Italy causes them "constant solicitude," owing to its having taxed the foreign holders of its rentes—a proceeding of which, with all their efforts, they have only obtained a "temporary modification." About Greece their tone is one of the deepest despondency, and they plainly intimate their belief that the financiers of that country are unmitigated knaves. Of Turkey they speak hopefully, but without enthusiasm. From Tunis they have got a mortgage of the customs duties, which provides for the interest and creates a sinking fund. Liberia has followed the example of some of the larger states by defaulting on its coupons, but the President says that when the legislature meets the Republic will resume payment, which suggests the reflection that it would have been well to save the public credit by calling an extra session. Their report about San Domingo is positively sad, for it appears that the President of the Republic made over to the Samana Bay Company a portion of the rights he had already pledged to the bondholders, and the Council had accordingly to notify the Company that no financial operation on its behalf would be

permitted on the European markets until it relinquished these rights. An agreement was subsequently entered into for the purpose, which, however, the Company failed to fulfil, owing to its ruin at the hands of General Gonzales; and an application to President Grant for redress proved fruitless, as our old friend, Tom Murphy, knows to his cost. Gonzales, too, has openly signified that he does not care a straw about the bondholders or their debt.

Mexico was cheating actively when she received notice that no more loans of hers would be admitted to the European markets until she settled in some way with her creditors. "The effect of this intimation," says the report, "became immediately apparent," and negotiations are now going on, but very slowly, owing to the fact that "the people regard their creditors with contumely," and the statesmen are all the time hoping that something will turn up which will save them the necessity of coming to terms. Guatemala is honest, and pays her way. Honduras is in so wretched a condition that her creditors are hopeless. Nicaragua has offered a compromise, but it is spoken of so disparagingly that we presume it is the equivalent of twenty-five cents on the dollar or thereabouts. Costa Rica gains time by every possible device, and "tries to propitiate the bondholders by courteous treatment of their agents"; but this has gone far enough, and a public indignation meeting is about to be called upon to take up her case. The United States of Colombia are behaving well, but Venezuela has proved impudent as well as dishonest, for her congress had refused to settle with her creditors unless they advanced more money to make a railroad—a proposal which was "indignantly rejected." Ecuador is in deep disgrace, and there is no present sign of her getting out of it. About Peru the Council feels hopeful. Bolivia is under a heavy cloud; and though the material condition of Paraguay seems to be improving, the state of her morals may be inferred from the fact that "lands and buildings hypothecated to the bondholders are being extensively sold at very low prices by the Government." Uruguay, on the other hand, nobly fulfils all her engagements under the most adverse circumstances.

A large portion of the report is, as might be expected, devoted to the State and railroad obligations of this country. After speaking in the highest terms of the credit of the United States, it discusses that of the Southern States, which are the only ones, excepting Minnesota (which has repudiated some railroad aid bonds), about whose conduct there is any question. Of these States generally it says that the legislatures have manifested but little disposition to settle with their public creditors, and do little beyond appointing commissioners to negotiate, apparently with the view to indefinite postponement, and at the same time "much disappointment is expressed because the aggrieved creditors refuse to co-operate in schemes for selling lands, opening mines and smelting works, and forming railroads"; but the Council says that their experience in the cases of Mexico and Venezuela has shown that "the extension of public works does not produce any corresponding desire to discharge the public debt."

The amount of these unpaid government obligations has now become so large that an attempt has been made in the interest of the holders to obtain from the English Government some kind of interference on their behalf, by a motion in the House of Commons for the appointment of a Committee of Investigation, accompanied by a suggestion on the part of the mover, Sir Henry James, that there ought to be some remedy when loans, as was now not unfrequently the case, were obtained by fraud, or their payment or the payment of the interest fraudulently evaded; but of what the remedy should be he confessed he had not the slightest idea, nor did he see what beyond "exposure" was to be gained by the investigation.

The Council of the bondholders does not indulge in the hope of relief at any time through government interference, but avows frankly its reliance on the moral influence of entreaty, remonstrance, and denunciation, though it thinks some good might be done by the establishment of an international tribunal before which exposures could be made. It is, however, plain enough, that there are only two things on which, in the present or any probable state of the world, the creditors of states can place reliance: one is the moral character of the people to which the money is lent, or (failing this) the possibility of shutting out defaulting governments from the exchanges of the world, and thus preventing their raising subsequent loans. This last remedy has now been very thoroughly organized in Europe. The exchanges of all the great money centres make common cause, and a defaulter in one is remorselessly excluded on demand from the others; and with the present eagerness for loans for purposes of "public improvement," there are few states which cannot be, sooner or later, brought to terms by this remedy.

There can be no question, however, that the moral sense of political communities is in a low state with regard to pecuniary obligation, and needs considerable cultivation in that direction before it will supply entirely satisfactory security, and it is likely to become worse rather than better as affairs pass more and more into the control of the class which lives by weekly wages, and has not been bred in the notions of commercial honor prevalent in the class which carries on its business by credit and associates default with ruin. When we consider the weight and complexity of the influences which society has to bring to bear in order to make individuals pay their debts, we can better understand the proneness to bankruptcy of large communities composed, in the main, of people who find the greatest difficulty in making ends meet in their private affairs. Each citizen finds his share of the responsibility for national obligations so small that it hardly troubles him, and the shame of failure, which is so powerful an agent in repressing dishonesty in private life, does not reach him at all, as all his friends and neighbors are in the same boat with him, and the indignant creditor or scornful observer is three thousand miles away. In fact, the work of political education during the next fifty or one hundred years will largely consist in the diversion of a portion of the patriotic pride, which is now employed almost exclusively in stimulating military ardor, to the work of quickening the sense of commercial honor. To adapt patriotism to the conditions of modern life, it is desirable that failure to pay national debts should be as much dreaded as inability to resist a national insult. The existence in a political community of large numbers of persons whose blood boils if they hear of an outrage on the flag, but only grin when they hear that the creditors of the state want their coupons paid or object to having their debts "scaled," is a survival, and a very unfortunate one, from barbarous ages.

But we ought to say to the London bondholders that no great improvement in the pecuniary morals of small or poor states can be looked for, so long as lenders in the great money markets are as credulous and as eager for high rates of interest as some of the loans contracted every year in London show Englishmen to be. A very large number certainly of the loans raised there by Americans could not be raised in this country, were capital never so plentiful, and some of the accompanying inducements offered are such as to suggest, one would think, to every rational man, that if the undertaking were sound it would never have been allowed to leave New York or Boston. If the stories of the projectors were trustworthy and the fortunes they offered were reasonably certain, people here would sell everything else in order to supply them with funds. A great deal of our private morality in business is maintained by the difficulty of getting money. If the banks were to lend lavishly to all comers, the result, as long as the funds lasted, would be demoralizing to the last degree; and as long as governments can get money in London and Amsterdam for the asking, so long will bondholders have to fill the earth with their annual wail. The political character of a community, on which its credit has to rest, must, in these democratic times, be looked for in the ability of the government to maintain order, in the recognition in legislation of the value of commercial honor, and, though last, not least, in the disposition of the masses to commit the administration of their affairs to leading men. Any lender who accepts, in lieu of the display of these things through a series of years, the promises or gasconade of smart agents sent out to negotiate loans, ought not to ask anybody's sympathy when he finds himself cheated.

## A STUDY OF TOWN-MEETING LEGISLATION.

### THE DARK SIDE.

IF in one corner of an agricultural town there should spring up a large and thriving factory, owing perhaps to the development of a previously unused water-power, there is no reason apparent why the owners and employés of the factory should not attend town-meeting, and harmoniously discuss and vote upon the same questions which concern the rest of the community. After a time, as the factory business increases, and the machinery is run by night as well as by day, the buildings and passages between them would need to be lighted with gas. At this juncture, suppose that the owners at the annual meeting should request the town to vote an appropriation to pay for this gas-light, and, by calling in all their hands, should actually contrive to pass such a vote, could there be more than one opinion with reference to the justice of their action? They would be robbing the farmer of his money as truly as though the same amount were taken from his pockets by highwaymen on the road.

We have no doubt of the unanimity of the verdict which would doubtless be pronounced upon this supposed transaction, even by those who are practically in the habit of voting with the factory owners in favor of having their gas-bills paid by other people. For our supposed case is not only a perfect illustration, but is in fact almost a precise statement of what is taking place to-day in many towns throughout New England. The legal form of the injury may generally disguise the fact of the robbery; but the extortion is none the less real, and none the less is the farmer's tax forcibly increased without his consent. Take, for instance, the case of the town spoken of in the former portion of this article. Originally agricultural, there has grown up in one corner a very large and flourishing village, the inhabitants of which now outnumber the rest of the town. Several small manufacturing villages are in different parts of the town, and farms fill up the remaining territory. The large village, or "centre" as it is usually called, has gradually developed a craving for "internal improvements." It wanted macadamized streets, and the whole town was requested and obliged to pay for them; it desired paved sidewalks, and the town in a similar manner consented to provide them; lights were required for the streets, and the farmer seven miles away helped pay for pipes and gas, though for himself he carried only a lantern with kerosene oil, and paid for both from his own pocket; water was wanted, that the "centre" houses might be built with "modern improvements," and the farmer, who drives his stock a quarter of a mile to a spring, had an addition to his taxes that the dweller at the "centre" might have the privilege of drawing water from a faucet in his private chamber; a "memorial" hall was projected, to ornament the "centre," and satisfy local pride, and the man who does not see it more than once a year was forced to pay for the costly and useless elephant; a new railroad was demanded to connect the "centre" with other towns, and although the several smaller villages happen to have all the railroad facilities they desire, nevertheless they were forced to acquiesce in that addition to the taxes which comes from lending the credit of the town, to the amount of several hundred thousands of dollars, to the proposed road—a road, by the way, which has not been built, while the town, obliged to pay useless interest on its own bonds, is groaning beneath the burden so foolishly assumed. Similar facts might be detailed until a lengthy catalogue had been written out; but enough have been given to show that the most shameless extortion is practised by the inhabitants of one portion of the town upon those living in another portion. We admit, of course, that some of these measures may have been of universal benefit; but, after all necessary allowances have been made, there will remain more than enough to justify the statement that fifty per cent. has been permanently added to the taxation of a large portion of the inhabitants of the town, who not only did not desire the appropriations to be made, but who have not been, and can never be, directly or indirectly benefited by the money spent. These have been compelled to pay for the pleasures of other people.

The privilege of voting, it is evident, gives very little defence against this manifest injustice; and even free discussion, on the benefits of which we are wont to pride ourselves, seems to do almost nothing toward checking these proceedings. It is very seldom, in fact, that, at the annual meetings, any protest whatever is made against this method of pickpocket legislation. There will be objections in abundance against any single measure necessitating an increase of taxation; special acts, like those mentioned above, will be resisted on all possible grounds save the one ground of the absolute injustice of all such legislation. Even the defrauded ones seem to have no adequate conception of the wrong done them. They have become so accustomed to it that they submit as though these things were necessary portions of the burdens of a sinful world. Talk to a grumbling farmer of the causes of the increase of his taxes, and, rightly enough, he will point to these measures which added so many per cent., and to those measures which added so many per cent. more, and all, he will add, of no use whatever to him. But in the very next breath he will tell over a long list of things which should be done for him and his neighbors in the town—things as useless to the "centre" as are to him those against which he has been grumbling. And the "centre" has learned to take advantage of this obtuseness, and, by shrewdly promising some slight favor to the farmers or to the small villages, actually manages frequently to secure their votes in favor of its more expensive schemes. The town, for instance, will vote to put a clock into the tower of a new church in one of the small villages (although every man carries a watch, and all the factories have bells and whistles), and, tickled with satisfaction at getting the toy for nothing apparently, not a man in that village will vote against some tenfold more expensive toy which the "centre" requests for its own especial gratification. Anything seems to be finally accepted as right if only a majority of the votes can be obtained for it after an open discussion at town-meeting. There is a singular and blind acquiescence in the will of a majority; this cannot be disputed, but indicates divine right as truly as in former times did the will of the king.

So long as the towns remained small and homogeneous, this injustice was not possible. No measure could be passed, whether good or bad, which did not affect all equally. Even the old ecclesiastical laws, which would now be exceedingly tyrannical, were not so at the time they were passed, for they were based upon that which all alike professed, and were required for the good of the whole, not for the benefit of a part only. When the Quakers and Baptists were finally allowed to remain in Massachusetts, for example, the religious homogeneity of that State was for ever at an end, and, gradually, everything connected with religious belief has been excluded from the province of legislation. Nothing of this once close connection now remains, with the exception of a few more or less atrophied strands, which are slowly snapping in obedience to the logic which first began their severance. While special ecclesiastical regulations are thus entirely abandoned, there still remain in force many general laws in which Baptist, Quaker, Puritan, and infidel are alike interested—laws of restraint, of protection, of the maintenance of justice. In short, as religious variations were introduced, it became necessary to take religion out of the field of legislation, or, in other words, to make ecclesiastical laws as general as those which apply to all associations for special purposes. And this seems to indicate a simple principle of legislation, namely, as population becomes more varied, legislation must become more general, affecting equally the whole, and not any one portion of the people. More and more, therefore, will it become necessary to remove from legislation many things once admissible, until at last, as interests become more conflicting and population more heterogeneous, legislation will more and more tend to confine itself to the task of perfecting the laws of equity. Only when this principle is generally recognized will legislation, in town-meeting or anywhere else, be restricted to the limits within which it rightly belongs.

Not only is this principle as yet very far from popular recognition, but the traditions and education of a large part of the American people are in direct opposition to it. De Tocqueville says that "town-meetings are to liberty what primary schools are to science: they bring it within the people's reach; they teach men how to use and how to enjoy it." Our conviction of the truth of this sentence was perfect, until observation had taught us that it can be accepted only with some serious modifications. Town-meetings may teach how to use and how to enjoy liberty where it already exists, but they do not necessarily bring liberty, nor do they ensure its preservation. The education of the town-meeting has been thoroughly bad in some respects. Its training has taught men to direct attention to special cases instead of general principles. In a town-meeting, no subject is too great or too small for discussion and decision by majority vote. From a railroad loan, burdening the town with debt for a generation, and virtually mortgaging every farm and building within its territory, to the appropriation of five cents a head to carry a dozen children to school, all comes legitimately within the scope of town-meeting discussion, and nothing is ever settled for more than a year at a time. School appropriations and constable's fees, laborers' wages and the choice of hog-reeves, all must be annually debated and determined anew. The representative elected from such a meeting to the State legislature naturally carries with him the ideas and methods of legislation begotten of his early surroundings, and the legitimate result is seen in the patchwork and makeshift character of much of our State and national legislation. The amount of special and interfering legislation in Massachusetts alone last year was truly enormous. From the management

of the Hoosac Tunnel and the sale of lagerbeer to the length of mature lobsters and the proper size of milkmen's cans, all subjects were debated and voted upon almost precisely as though the members of the Legislature were still in their familiar town-halls; and the belief was apparently universal that no subject could be exempted from special legislation. When we remember what is done in towns, we need not wonder at what is done in State and nation, nor marvel at the spectacle of legislatures and houses of Congress converted into big and degenerated town-meetings.

While these ideas of special and universal legislation prevail, it is safe to predict that we shall never get far away from our present grave difficulties. We have been trying to carry into general government, and endeavoring to make suitable for a large and exceedingly heterogeneous nation, methods of legislation originally adapted only to small and perfectly homogeneous communities; and so long as we persist in this course, so long will our difficulties wax greater and corruption find a broader field for work. We are aware, of course, that many politicians will object to what we have said as tending to confine legislation to a channel altogether too narrow to permit the full exercise of the legislator's talents. It may even be argued, also, that although there may be much injustice done by the petty legislation of town-meetings, yet if we object to the appropriation of public money for the purchase of church-clocks and private gas-lights, the same logic may lead at last to the stoppage of subsidies to steamships, of grants to railroads, and even of protection to native industry. We have not space to consider these objections at present, but shall be satisfied for the time being if no one pushes us to any application not contained in the accepted precept—"Let him that dances pay the fiddler, and not step on his neighbor's toes."

## RESTIF DE LA BRETONNE.

PARIS, February 26.

I WAS much surprised when I received last year a catalogue of books, in which I found a long article by M. Paul Lacroix (known under the name of "bibliophile Jacob") on the works of Restif de la Bretonne; even more surprised when I saw the high price which was asked for the works of this writer, whom I had been accustomed to regard as beneath notice. These high prices, to be sure, were chiefly to be attributed to the curious and sometimes beautiful illustrations of the works of Restif, and to their extreme rarity; but still, I could not but wonder that M. Paul Lacroix took so much notice of a writer whose name was once only pronounced with contempt. "Restif's books," wrote he, "are now very rare; they will become more so, as they are now sought after by the great amateurs of bibliographic curiosities. These books contain the most interesting documents for the history of the manners of the time. The peasants, the workingmen, the men of the people, never had a more faithful or more sympathetic painter than Restif de la Bretonne. His works, in which, as in a mirror, the various aspects of French society from 1760 to 1805 are reflected, will be monuments of the manners and morals of that period, as the works of Petronius and Apuleius are of the Roman antiquity." M. Lacroix has now published a magnificent volume, edited with much care, under the title of 'Bibliography and Iconography of all the Works of Restif de la Bretonne, containing a description of all the original editions, and of all the engravings in detail; with many historical, critical, and literary notes." M. Lacroix has become bolder, and he does not now hesitate to write that the 'Malédiction Fraternelle' is as good a novel as the 'Nouvelle Héloïse' of Rousseau; that 'Monsieur Nicolas' is *perhaps* superior to the famous 'Confessions.' "Perhaps" is prudent, and M. Lacroix may perhaps suppress it in another edition.

Let us make allowance for the enthusiasm of all discoverers, and let us look a little closer at this extraordinary man. This is how he describes himself in 'Monsieur Nicolas': "I am a great fabulist, who, instead of taking animals as interlocutors, chooses himself. I am a complex animal, sometimes sly as a fox; sometimes heavy, slow, and stupid as an ass; sometimes proud and courageous as a lion; sometimes cowardly and gluttonous as a wolf, eagle, and vulture, or simply partridge or lark."

Restif was the son of a peasant of Burgundy. He came to Paris as a printer, and began at once to write novels. The first appeared in 1762, and appeared without his name. In this book, as in those following it, he always took his facts and characters from real life. He had been either an actor or a spectator of all that he relates. He was already married in 1762, and the father of four children. He was evidently a very vain person, as he abandoned from the day of his marriage the habit of wearing a wig, which was then universal; and, being too poor to be noticed for his fine dress, he affected to be very *négligé* and even dirty. We find him writing novel after novel, full of what was then called *sensibility*, for a few years before he rose to notice; fighting with the censorship, as his books were thought too free in some parts. Their extraordinary titles are sufficiently instructive—'Lucile; or, The Progress of Virtue,' by a Mousquetaire; 'The Girl Kept (*entretenue*) and Virtuous; or, The Progress of Virtue'; 'The Girl Ravished, Kept, Prostitute, and Virtuous; or, The Progress of Virtue.' He sticks his 'Progress of Virtue' to the most extraordinary anecdotes.

His first successful work was the 'Fool of Fanchette,' in 1769. He had therefore toiled in vain for seven years, obliged to work in the printing-office when he did not write. The intrigue of this story is very common, but the pretty, small foot of the young *marchande* of the St. Denis, in its pretty pink shoe, is an agreeable object, and there are original remarks here and there. This maniac—for I really believe Restif was nothing else—professed all his lifetime a sort of devotion to small feet. A whole volume might be extracted from his voluminous writings on this single subject. When he employed the clever Binet to draw the engravings of his books, he constantly tormented him about the size of the heroine's feet; and really, the ladies of Binet's collection, so much sought after now, seem to be walking on stilts.

The book which really made Restif's reputation is the 'Perverted Peasant,' which he printed himself, like most of his works. While he wrote a number of novels with an extraordinary rapidity, he worked for several years at his 'Peasant.' He brought himself on the scene under the name of Edmond, and introduced many personages whom he had known in Burgundy. When the book appeared he was in the depths of misery. He was so poor that he was obliged to borrow a little money from a printer, and he could not have finished his work if his brother had not helped him. His wife made him very unhappy; and it cannot be wondered at that she did not like him, if the anecdotes Restif tells about himself are true. Restif began the 'Peasant' after reading Richardson's 'Pamela.' The principal heroes of the work are his own sister, who, after the saddest adventures, finally married a hackney-coachman; a friend of his, inspector of the state forest, who dishonored himself, and could only leave his house at night. "You may imagine how I must have been affected as I wrote this history, founded chiefly on my own experience and the fate of my sister."

This book had several editions. It shocked many, and was admired by some. Crébillon the Younger and Mercier expressed to the author their admiration. The general public only read it because there were many licentious passages and scenes taken from places which no writer had yet dared to describe. Everybody read it. The French capital had never been described with such minute details; so much corruption and crime had never been heaped in so small a compass. I have tried several times to go through the 'Perverted Peasant.' I confess that there is in it a certain energy, a bold delineation of passions and characters; but, on the whole, the book is nauseous. It makes upon the nerves the same effect as a dissecting-room or the Morgue. The pretended morality of Restif is repulsive; he shows the deplorable effects of vice, but he scrutinizes vice with a morbid curiosity. It always seemed to me a counterpart of Rousseau's 'Emile.' The great philosopher of Geneva tried to reconcile an overcivilized community with nature; Restif shows the true Emile, the ignorant man of the country arriving at the capital, and destroyed by its corruption.

Grimod de la Reynière introduced Restif to the literary circles of the capital. He was soon considered as an insufferable original, full of vanity. Grimod gave him the money which paid for the illustrations of Binet, worthy of such a work, as they are full of license as well as of talent. Restif, elated by his success, composed a novel which he called 'The Perverted Country-Girl.' He was beginning to give himself out as a social reformer; wrote the 'School of Fathers,' the 'New Emile; or, Practical Education,' the 'Gynograph; or, Thoughts of Two Honest Women on a Project for Placing Women in all Europe in their Right Place, and Making the Happiness of Both Sexes,' the 'New Abélard.' His fecundity is almost alarming. He had a very curious way of composing some books. He seems to have been haunted during all his lifetime with the mania of love-making. He went every day before a milliner's shop in the Rue de Grenelle, and slipped love-letters into the hands of the young *grisettes* as they came out. He always kept a copy of them, and he introduced these letters in his novels. His deities were always of the lowest order—sometimes a florist, sometimes a vender of sausages. He was eminently a man of the people—a lover of street-scenery, like Paul de Kock. As often happens with such characters, his love of vulgarity was only perverted pride. In his 'Life of My Own Father' he makes for himself a genealogy. He discovered with many efforts that he was descended from the Emperor Pertinax. (Restif, in French, means 'tenacious'—'pertinax' in Latin.) He probably laughed himself, at first, at this discovery; but, by degrees, it

seems that his mind became quite accustomed to the reality of this genealogy.

The 'Contemporaines; or, Women of Our Time' forms an interminable series of forty-two volumes. They have fallen chiefly into the hands of milliners, not only in France, but in other countries, as the curious drawings of Binet form the best journal of fashion of the end of the eighteenth century. Restif himself superintended the work of the artist.

In the 'Découverte Australe,' we see in Restif, who was a very ignorant man, a predecessor of Darwin; he attempts to show that there was at first on the globe but one species of animals and one species of vegetables, and he had great difficulties with the royal censor on account of a chapter on monkeys considered as the ancestors of men. He returns constantly to his socialistic plans, and publishes the 'Andrograph; or, Ideas of an Honest Man on some Laws, presented to all the Nations of Europe, for a General Reform of Society and the Happiness of Mankind.' In this work he adopts communistic ideas, and Restif has sometimes been represented by the Phalansterians as one of their early apostles. His 'Last Adventures of a Man of Quality of Forty-Five Years' is, in M. Paul Lacroix's opinion, a *chef d'œuvre*, superior to 'Manon Lescaut.' "I composed this book," writes Restif himself, "as fast as the events happened. This has given to it the form of a journal. I was profoundly affected while I wrote it, and look upon it as the completion of my existence." I cannot share the enthusiasm of M. Lacroix; there is in this work some force, some truth, but sickly sentimentality mixed with sensuous ardor do not form a sufficient corrective for coarseness and vulgarity. The style of 'Manon Lescaut' is admirable in comparison with the odd, fatiguing, restless, incorrect style of Restif.

The work which he himself preferred to all his numerous productions was his 'Perverted Country-Girl.' The author, he himself wrote, has *thought* this book more than any other. He assures us that he composed it with tears in his eyes most of the time. "Woe," he exclaims in the fashion of Jean Jacques Rousseau, "to those whom these letters would not move, trouble, and tear; he would have no human soul, he would be a brute .... a brute or a purist." He often speaks of what he calls the purists: "The purists are the born enemies of all good."

When the revolution broke out, Restif remained, like Pierre de l'Estoile during the League, at home; still he gives us his impressions in the 'Paris Nights,' and in the fifteenth volume of 'Monsieur Nicolas' his indirect autobiography. He became, of course, a revolutionist. "French nation," he writes, "feed no more lions, or leopards, or unicorns; they are useless; feed the sheep, the horses, the donkeys, the pigs." He is not only a partisan of the revolution, he is a Parisian Communist. "Let us exalt our capital, let her be the centre of all." He has some feeling of pity, however, for Louis XVI.; he becomes by degrees an enemy of the new men in power; in 1793 he has ceased to be Republican or Jacobin, he is merely a Communist, a Socialist. He admires Marat, but calls Charlotte Corday an "interesting young person." He becomes frightened, and writes the most cowardly praises of the Mountain. The trial of Marie Antoinette moves him, but only as a romantic incident. The 'Paris Nights' ends with this dreadful incident. Restif dares not go on; he runs no more through the streets in the night; he trembles for himself. At the 9th Thermidor he begins to breathe again.

I must leave Restif here, but not without mentioning the splendid work called 'The Monument of Costume, Physical and Moral,' which owes its fame to the magnificent illustrations of Moreau, junior. It is a folio work with twenty-six engravings, which are all real works of art, and which fetch now almost fabulous prices when they are in good condition. I have omitted I don't know how many works; no man ever spent so much ink and paper; he wrote a novel a month, and all that will remain of him, after all, will be the mere titles of a few books—a dubious reputation. His name will never be pronounced without giving the sensation of something unclean; his soul was in reality that of a villain.

# Correspondence.

## MR. JOY AND THE BOSTON RAILROAD SCANDAL.

To the Editor of The Nation:

Sir: I have read your article about the "Boston Railroad Scandal," and think it justifies me in asking you to read the enclosed communication.

I have never sought to avoid in any way before the world any share in any responsibility of any transaction in which I have been engaged, and at this late day I shall not in this. It has been a necessity of mine, having charge of railway interests in the West, to be compelled to report to the Board in Boston, for its consideration and action, the progress of railway construction in the West which might affect the interests which were under their and my charge. They could get the information in no other way. As I have said, this is a necessity under which any Western manager of a road whose Board and stockholders live East, must act. It is an ungrateful necessity, because, whatever the Board may do upon the fullest information, should there be an unfortunate result, the Western manager can easily be designated as "the prime mover and concocter of the scheme," and all the blame of results thrown upon him. You will notice, by reading the enclosed letter, more fully what this transaction was and the objects which were to be accomplished. They could not fail to have been fully discussed in the Board, and were so from time to time. The circular issued to the stockholders of the C., B. & Q. Company itself states enough to show that they were so discussed. It was my business and my duty to place the case before the Board, which I did fully, and was present at some of the discussions. Yet at the meeting when *final* action upon the matter by the C., B. & Q. Board was had, *I was not present*. This meeting was held June 5, 1871. I did recommend the traffic contract, which had been agreed to at a prior meeting, I think. I was not the originator or "concocter" of the plan of offering these bonds to the stockholders. That had been frequently done before, and, all things considered, was deemed by the Board expedient and a good thing to do in this case, as it had been in the former ones. I know they could easily have been sold outside at that time, and there was no necessity of offering them to stockholders. It was believed to be another good thing for them, like the many they had had before.

I have not the slightest disposition, however, to avoid responsibility on this account. Had I been present, I should have voted with the Board, approving and authorizing the circular; though, by the light of present experience, a portion of the plan to have been carried out has failed.

It is easy to blame when the result has been unfortunate, and very many will then seek to visit the censure upon others than themselves. But with the consciousness that our motives were the welfare of the C., B. & Q. and its stockholders, I am no more disposed to avoid my share of the responsibility than I am to give the whole credit to others in the numerous similar cases where, under similar circulars, bonds have been frequently offered to such holders, by the taking of which they have made large profits. In the thirteenth or fourteenth case, as it *now seems*, a mistake has been made. In all the prior ones, stockholders have been largely benefited. That they have not profited in this is matter of profound regret, and my judgment with regard to it may be gathered from the enclosed letter to Mr. Bartlett.—

Yours truly, J. F. Joy.

Detroit, March 16, 1875.

---

[We have examined with care the defence of his conduct to which the above communication from Mr. Joy refers. It is in the form of a published letter addressed to Mr. Sidney Bartlett of Boston, who, with some of his co-directors, came out with a card on the subject in one of the Boston papers. Mr. Joy complains that this card did not take "the firm and manly tone" which it should have taken, and also objects to the blame being thrown on him for what, as he maintains, all did together. He then proceeds to show, by a review of the circumstances (which he discusses in great detail), that it was for the interest of the Chicago, Burlington and Quincy Road, either for the purpose of preventing competition or of creating business, to obtain control of the Chicago, Clinton and Dubuque, and the Chicago, Dubuque and Minnesota, and that the directors of the Chicago, Burlington and Quincy all agreed upon this policy as a sound one; that in pursuance of this plan the directors took stock in the construction companies, and the road itself guaranteed the bonds and sold them to its stockholders. As to the construction contract, he says that construction companies do "not in any degree vary or change the liability enacted by the law, and all, therefore, which Mr. Forbes said about the form of the contract has no meaning in it." By those who have followed the matter, it will be seen that Mr. Joy makes here substantially the same defence he did at the beginning, and that this defence in no way meets the charges against him. These charges were, first, that he, being director of one road, took a secret interest in the contract for building branch lines, the nature of this contract being to put in his and his partners' hands all the securities of the branches, without any

obligation being imposed on them to complete their work, and that he then, concealing the facts, sold the securities to his own stockholders; that is to say, he was to receive his share of the securities, and he was to induce people to whom he stood in the relation of trustee to buy them, the nature of contracts materially affecting their value not being revealed. It is the case of a trustee making contracts with himself at the expense of his *cestui que trust*. If the acquisition of these branch roads was really necessary to the Chicago, Burlington and Quincy, the Chicago, Burlington and Quincy might have undertaken to build them, dividing the benefits or losses among the stockholders; but that would have been a different thing from Mr. Joy with his friends undertaking secretly the work of building them, dividing all losses among the stockholders of the Chicago, Burlington and Quincy, and all benefits among themselves. The contracts with the construction companies are contracts, as Mr. Forbes very well put it, *not* to build the road. To say that because a construction company is approved by law, therefore any contract with any construction company is proper, shows a singular confusion of ideas. That this is actually the state of Mr. Joy's mind we may infer from the fact that he winds up his letter with a sort of defence of Crédit Mobilier, without which "institution," as he calls it, the Union Pacific could not, in his opinion, have been built.—Ed. Nation.]

## "RHETORICAL TRAINING."

To the Editor of The Nation:

Sir: I have read with much interest the articles which have appeared in the last two or three numbers of the *Nation* on the expediency of teaching schoolboys the art of declamation. I do not write for publication, but simply to give you the result of my experience as an instructor of boys. Several years ago I became convinced that it was worse than folly to teach a boy to declaim before you had taught him to think; that the polish which the elocutionist could give him was useless without the well-ordered brain to back it up. And I also found that to attempt to teach him to declaim in public and to learn to think — both at the same time — was impossible. To learn the latter process is dry and uninteresting compared with the former. To declaim well in public is to be followed by more or less flattery, and soon the boy comes to believe that there is nothing in the world quite so essential to make one a great man as to be able to spout well. I am now surprised to know how exactly I had arrived at the very conclusions that you have given us in the *Nation*. So of late years I have given up the practice of having boys declaim publicly. In its place, I practise them somewhat as follows:

On Saturday morning the boys are all assembled in a proper place, when several of them, who have been designated the week before, stand up and expound in turn some subject upon which they have thought and studied. They are required to make the argument or explanation logically, to express themselves clearly and in good language, and are never allowed to talk on any subject beyond their comprehension. It is all done in a conversational way, soberly and carefully. For instance, to-day their subjects are the difference between the polar and equatorial diameters of the earth, the construction and use of the thermometer, the construction and use of the barometer and how it differs from the thermometer; and some of the more advanced boys talk on more speculative subjects. This teaches boys to think and speak on their legs, without offering any inducement to use high-flown expressions or windy rhetoric. It teaches boys to investigate and learn the cause of things, and, what is of most importance, never to attempt to talk to others on a subject they do not understand. I find that boys subjected to this discipline soon acquire an unmistakable contempt for "spread-eagle" orators in politics, religion, or science.

One thing is certain, that rhetoric, as taught in American schools and colleges, has not produced a class of *thinking* men. We have hosts of men of superior oratorical powers, and who can describe to you with great accuracy all the figures and constructions found in rhetoric. But we have few men, even in our legislative bodies, who can express themselves clearly and with force, and who do not lug into every discourse they make some glittering generality or windy passage having no connection with their subject. I beg pardon for referring to my own work in this matter. I have a hearty contempt for the effusions of the average American statesman; and now that you have taken the subject up, I trust you will say something further on this matter of educating boys.—Very respectfully,

M. A. K

Oakfield, N. Y., March 20, 1875.

# Notes.

G. P. PUTNAM'S SONS will shortly publish a volume of selections from the correspondence of the late Mrs. Henry M. Field, entitled 'Home Sketches in France,' which will be looked for with interest by those who have known the writer's unusual gifts and opportunities for observation in her native country.——Mr. J. Disturnell proposes to publish by subscription a Centennial guide to this metropolis, 'New York as It Was and as It Is' (1776–1876).——Mr. Geo. F. Hoar makes a strong appeal in the Boston *Advertiser* for Massachusetts aid in rebuilding the College of William and Mary, Virginia, which was needlessly, not to say wantonly, destroyed in 1862 by Federal troops. The college has had illustrious graduates—Jefferson, Monroe, Marshall, Peyton, and Edmund Randolph, among others—and gave a surveyor's diploma to Washington. The XLIId Congress just failed of making an appropriation for it, to which there could have been no moral objection. In the meantime, private legislation has fallen into deserved disrepute, and the college apparently abandons all expectation of Congressional assistance. We shall be glad if Mr. Hoar's appeal is responded to; and yet if we were Virginians, we should perhaps favor merging William and Mary with some stronger college in the State, which has too many colleges for its means and population.——The chief feature of the *Geographical Magazine* for March is an account of Lieut. Cameron's voyage round Lake Tanganyika, which resulted in his finding the outlet overlooked by Livingstone—an omission which probably cost the latter his life. A sketch survey of the lake by Cameron is superimposed on one by Livingstone, and shows important differences. In Petermann's *Mittheilungen* for January 30 there is an admirable map of Chili in two parts, derived from the national survey, in which this country has taken the lead of all the other South American States. No such precision in delineating the Andes has heretofore been attained.——A work whose importance must ensure its eventually being translated into English is Dr. Neumayer's 'Anleitung zu wissenschaftlichen Beobachtungen auf Reisen,' or instructions for the making of scientific observations by travellers. The editor has had the assistance, in separate chapters, of authorities like Koner, Kiepert, Virchow, von Richthofen, Bastian, Schweinfurth, von Martens, etc. For the subject-matter of the book, one may consult the last issue of *Nature* (Jan. 25).——Mr. F. Leypoldt makes the gratifying announcement in his *Publishers' Weekly* that he is going to begin the compilation of his American Finding List at once, and hopes to complete the first volume in time for the Centennial. Once published, it will be supplemented by an annual catalogue on the same plan, "so that the American bookseller will have a Finding List always up to date."

—We are authorized to state that a number of sets of the photographic copies of Mantegna's "Triumph of Julius Cæsar" are now ready for delivery, and that American subscribers can procure them by sending two guineas to the treasurer of the Mantegna Society, Mr. Joseph Dickson, 5 Brick Court, Temple, London, E.C., together with the address of their London agent. This mode of delivery is preferred, but the photographs will be forwarded, if necessary, through the ordinary agencies at the subscriber's expense. "Considering the artistic importance of these works," writes Mr. Wallis, "I may suggest they would be most valuable to art societies, literary institutes, and educational establishments generally."

—Mr. Frederick Martin's 'Statesman's Year-book' for 1875 (New York: Macmillan & Co.) bears the marks of conscientious revision since its last issue, and, with its chronicle of events, its comparative tables (considerably renewed), and its political and statistical account of the civilized states of the world, continues to be a most useful manual for study and reference. The *Année Scientifique* and *Année Géographique* are to be supplemented hereafter by a third serial, the *Année Politique* of M. André Daniel (New York: F. W. Christern). The first volume reviews the politics of the year 1874, but, for completeness' sake, also briefly summarizes for France the incidents leading up to the change of Executive on May 24, 1873, and those which succeeded to the end of that year. M. Daniel we judge to be a moderate Republican, and one of the adherents of M. Thiers while that chief remained in power. His review is naturally fullest in regard to French affairs; indeed, it professes to embrace those of foreign nations only so far as they have attracted attention in France or have had some relation to that country. This seems to us the weak point in the editing. The reported capture of Nana Sahib finds admission where no reference is made to the Tichborne case, though the latter caused much the more lasting sensation the world over, and is now proved to have had an important political significance. The United States enters upon the scene

but once—by reason of the November elections; and doubtless if no other event were to be mentioned, this outweighed all others in our political history last year. Nevertheless, a sufficient resemblance to French methods of controlling elections might have been detected in Grant's dealings with Louisiana to warrant an allusion to Kellogg and De Trobriand. M. Daniel's plan of treating each month separately has its advantages, but we hardly think it as favorable to obtaining a clear and connected idea of history as the treatment by country. If we were forced to choose, for instance, we might prefer the chapter on France in Macmillan's 'Annual Register' to the broken-up *Année Politique*. M. Daniel gives in his appendix a number of documents and *pièces justificatives*, viz., the text of the German ecclesiastical legislation of 1873; M. Teutsch's extravagant remarks in the Reichstag in February, 1874; part of Count Arnim's letter to Döllinger (April 21, 1874); the various papers involved in the Arnim trial relating to the condition of factions in France; the new French imposts (March 21, 1874); the Russian programme at the International Congress at Brussels; Carlist chieftains' orders; Señor Vega de Armijo's note to the Duc Decazes (Oct. 9, 1874), etc., etc.

—With the exception of the "Bible in the Public Schools" case in Cincinnati, the most interesting ecclesiastical suit which for some time has come before the courts is that of Hale *v.* Everett, in New Hampshire. A great deal of the decision (a full copy of which has been issued by the State Reporter) turns on local provisions of the New Hampshire constitution and laws; but the main facts were these. Some years ago, Mr. F. E. Abbot, whose name will be recognized by many of our readers as that of the author of some clever metaphysical articles in the *North American Review*, but who is much more widely known now as the editor of the *Index*, a radical Boston paper, was called to the pulpit of a Unitarian church in New Hampshire. The *Index* prints every week a little platform headed "The Demands of Liberalism," which are, 1st, that all ecclesiastical property shall be taxed; 2d, that the employment of chaplains in Congress and other public situations shall be discontinued; 3d, that all public appropriations to sectarian uses shall cease; 4th, that all Governmental religious services shall be abolished, especially the use of the Bible in the public schools; 5th, that the public appointment of fast and feast days shall cease; 6th, that all oaths be abolished; 7th, that laws for the observance of the Sabbath shall be repealed; 8th, that all laws looking to the enforcement of "Christian" morality shall be abrogated, and that all laws shall be conformed to the requirements of natural morality, equal rights, and impartial liberty; 9th, that politics shall be secularized, and Christianity "or any other special religion" be deprived of all special privileges. The *Index* counts among its "editorial contributors" persons of such widely different views as Mr. O. B. Frothingham, Mrs. E. D. Cheney, Rev. Charles Voysey, and Prof. Francis W. Newman; but we suppose the programme quoted above expresses the views of the editor-in-chief, and from them it clearly appears that he is not now a conservative. When he went to New Hampshire, however, to preach for "The First Unitarian Society of Christians in Dover," his attitude towards the Christian church was less purely negative, for the court finds that at the time of his ordination he had two children baptized "in the name of the Father, and of the Son, and of the Holy Ghost," and he appears to have "believed in Jesus Christ as the Messiah," and regarded his religion "as a revelation from God." This was in 1864, but from this time forward Mr. Abbot (to whom the court pays a high compliment on the score of the truthfulness and integrity of his character) gradually changed his religious views, becoming more and more radical, till April 1, 1868, when he resigned.

—Towards the latter part of his ministry it appears that he voluntarily abandoned all connection with Christianity, making statements in sermons and other public ways to the effect that "Jesus Christ was like other men, with no more authority," compared him with good men now living; said that he considered Christ a mere men, and fallible like other men; that Christ was not the Messiah; that if he believed himself to be the Messiah, he was mistaken; that the New Testament showed that Christ did claim to be the Messiah, but that he (Abbot) believed the Messiah had not come and would not come. He openly declared himself neither a Christian nor a Unitarian, announced his belief that Christianity was "merely one of many religions," each "partly true and partly false." He also declared that "humanity is its own Messiah," and that "religion has no more to do with Jesus than it has with Judas." From these extracts it appears, says the court, that the charge "that said Abbot was a progressive man, and that he changed his opinions from time to time," was true. In the course of Mr. Abbot's progress towards his present position he, of course, dissatisfied a great many of his congregation, and the members finally split into two parties, both of which naturally desired to get hold of the church property. An independent society was organized which desired to retain Mr. Abbot; this they proposed substantially to do by hiring him to preach and swallowing up the church organization in their own. Certain members, however, protesting against it, brought a bill in equity against the wardens of the society and others, praying for an injunction, and this they got, the Supreme Court holding that the church property being held in trust for a "Christian Unitarian Church" could only be used to support Christian Unitarian worship; that the doctrines preached by Abbot were subversive of Christianity and Unitarianism. An injunction, which we take to be somewhat novel in form, was issued forbidding the society to hire, employ, allow, suffer, or permit Francis E. Abbot, or any other person, to preach and inculcate in the meeting-house of the society doctrines subversive of the fundamental principles of Christianity, as generally received and holden by the denomination of Christians known as Unitarians; or "to employ, suffer, or permit to preach in said meeting-house any person who rejects Christianity altogether; or who teaches that, as a system of religion, Christianity is partly true and partly false; or who preaches or inculcates a disbelief in the doctrine of the Lordship and Messiahship of Jesus Christ, as taught by him in the New Testament Scriptures, or a disbelief in Jesus Christ as the great head of the church, or of his divine mission and authority as a religious teacher, as thus taught by him; or who preaches and inculcates a denial of the doctrine that the Scriptures of the Old and New Testaments do contain a divine revelation given by inspiration of God, and containing a sufficient and perfect rule of faith and practice."

—The North Carolina House of Representatives has just expelled one of its members for heresy. This gentleman, Mr. J. Williams Thorne, is a birthright member of the Society of Friends, and for twenty years has been associated with the body known as Progressive Friends, who annually assemble in Chester County, Pennsylvania. From this neighborhood Mr. Thorne removed, in 1869, to Warren County, N. C., as a *bonâ-fide* settler, with no political aspirations. Nominated last year by the Republicans as a Representative, he was elected and took his seat, and presently found himself on trial as an atheist. If this accusation could have been proved, it would, under the State constitution, have disqualified him; but Mr. Thorne affirmed in the most solemn manner that he always had believed, and did then believe, in the existence of a God, and he laid before the House a great many testimonials to the same effect from his friends and co-religionists in the North. He declared his perfect adhesion to the definition of God contained in the first of the Thirty-nine Articles of the Church of England, and was soundly abused for this definition by one of his opponents, who had not recognized the source of the formula. All this availed nothing, except to make it impossible to expel Mr. Thorne for atheism; but he was got rid of on the ground that he had "advocated and promulgated a most blasphemous document, subversive of the principles of the constitution of North Carolina and of sound morality." The constitution, however, only disqualifies those from holding civil office who "deny the being of Almighty God"; and nobody could affirm for Mr. Thorne what he himself denied. The previous constitution, it is true, disqualified "all persons who shall deny the truth of the Christian religion or the divine authority of the Old or New Testament," but the omission of this disability in framing the present instrument was an unmistakable sign of progress in toleration. (The Jews used to be excluded from office as denying the divine authority of the New Testament; and the Catholics were only emancipated in 1835.) Mr. Thorne's opinions as to the inspiration or validity of the Scriptures, therefore, were of no concern to the House. Nevertheless, the majority, adopting the view taken by the Hon. Mr. Staples, that "he who denied any portion of the Bible necessarily denied the existence of God," expelled Mr. Thorne, and the next day voted to exclude the Bible from the public schools.

—The amusing feature of this case is that the pretext made use of by Mr. Thorne's opponents was a pamphlet written some months before, in reply to a lecture in Pennsylvania by the Rev. Joseph Barker, who had asserted that, "as a class, those who denied the divine authority of the Bible were inferior in morals to those who accepted it." This was a serious reflection by the reverend gentleman on his own past career, inasmuch as it is not many years since he himself was what he would now call a "howling infidel," and used to make the West resound with his "blasphemies." Mr. Thorne tried to meet him in public debate—once a favorite amusement of Mr. Barker's—and, failing in that, resorted to his pamphlet, which is in no sense atheistical. Mr. Thorne is a Unitarian and a Darwinist (he was charged "with believing that man is a spontaneous production of the earth"); and he considers as spurious in the Bible whatever conflicts with

his own notion of the character of the Deity. It is clear, however, that Mr. Thorne's political sentiments were the cause of his ill-treatment, he being a "civil-righter," and in other respects a Radical Republican of the Quaker variety. During the canvass preceding his election, one Alfred Christmas, whom we take to be a colored man, alleged that for eighteen months, "while he lived with me," to use Mr. Thorne's own words, "I invariably weighed out his rations one pound short," and that "I was in the habit of playing cards with him on Sunday, and winning back the money which I had paid him on Saturday evening." Mr. Thorne repelled these charges as ridiculous; and so they were, for the fact is that he is a very worthy citizen, if not a Democrat or a native of North Carolina.

—"Almost the only real incidents," says Hawthorne in writing in 'Our Old Home' of his consular experiences—"almost the only real incidents, as I see them now, were the visits of a young English friend, a scholar and a literary amateur, between whom and myself there sprang up an affectionate and, I trust, not transitory regard. He used to come and sit or stand by my fireside, talking vivaciously and eloquently with me about literature and life, his own national characteristics and mine, with such kindly endurance of the many rough republicanisms wherewith I assailed him, and such frank and amiable assertion of all sorts of English prejudices and mistakes, that I understood his countrymen infinitely the better for him, and was almost prepared to love the intensest Englishman of them all for his sake. It would gratify my cherished remembrance of this dear friend if I could manage without offending him, or letting the public know it, to introduce his name upon my page. Bright was the illumination of my dusky little apartment as often as he made his appearance there." Never was compliment more prettily concealed and conveyed, and Hawthorne was by no means the only American who knew that the crowning grace of these cordial words lay not so much in their sincerity as in their fitness. Hawthorne speaks of his friend as a literary amateur, and in this character Mr. Bright has just printed a little volume for private distribution, of interest to all the admirers of the genius of Burns. It is called 'Some Account of the Glenriddell MSS. of Burns's Poems: with several Poems never before published. Edited by Henry A. Bright.' It appears from Mr. Bright's preface that, more than twenty years ago, the widow of a son of Dr. Currie, the biographer of Burns, presented to the Liverpool Athenæum two manuscript volumes, one of them containing poems and the other letters by Burns, mostly in the poet's autograph, and selected by him for his friend Robert Riddell, of Glenriddell, Esq. These volumes had remained almost unnoticed in the Athenæum library till they recently attracted Mr. Bright's attention. The volume of letters contained some unpublished matter, most of which Mr. Bright sent to the (London) *Athenæum* of August 1, 1874. The collection of poems, a quarto volume of 162 pages, was made by the poet, as appears from the preface in his handwriting, in 1791, at the request of his friend Mr. Riddell, and as a tribute of gratitude to him and to his amiable lady "for the many, many happy hours the author has spent under their roof." He speaks of it as consisting "almost wholly of pieces local or unfinished," and he "trusts that nobody into whose hands it may come will, without his permission, give or allow to be taken copies of anything here contained, much less give to the world at large what he never meant to see the light." But, as Mr. Bright says, "almost everything the book contains has long since been given to the world, and the few things that Dr. Currie omitted, mainly on account of their political bias, may now at last be allowed 'to see the light.'"

—It is a pathetic circumstance, indeed, that the poet's injunctions should have been violated almost from the moment of his death. In Dr. Currie's memoir of the poet he prints a letter from a lady who saw Burns but a short time before his death, in 1796, in which she reports him as being in great concern about the publication of his posthumous works. "He said he was well aware that his death would occasion some noise, and that every scrap of his writing would be revived against him to the injury of his future reputation; that letters and verses which he earnestly wished to have buried in oblivion would be handled about by idle vanity or malevolence," and more to the same effect. Burns's reputation is indeed proof against his own poor verses, but a good deal that has been published under his name might better have remained in oblivion. The volume of letters that Burns gave to Captain Riddell shows the value he set on these compositions. In his well-known autobiographical letter to Dr. Moore he says; "I kept copies of any of my own letters that pleased me, and a comparison between them and the composition of most of my correspondents flattered my vanity." His letters have the faults for which such a confession prepares their readers. The manuscript volume of poems contains several of the best and most noted of his works, such as "Tam o' Shanter," "Holy Willie's Prayer," and "On Captain Grose's Peregrinations." Almost everything of worth, much or little, had been printed, but Mr. Bright's pious and tender regard for the poet's work was rewarded by a considerable number of variations in the text of familiar pieces; by two unpublished stanzas in the Epistle or Letter to John Gowdie, "O Gowdie! terror o' the Whigs"; by an Ode to the Departed Regency Bill, 1789, which is not distinguished by any flashes of genius; and by some hitherto unprinted portions of an Ode on the Birthday of Charles Edward, 31st Dec., 1787. In this piece there are two or three verses that show the poet. It begins with vigor:

> "Afar the illustrious exile roams,
> Whom kingdoms on this day should hail;
> An inmate in the casual shed,
> On transient pity's bounty fed,
> Haunted by busy memory's bitter tale."

The best of the new pieces printed by Mr. Bright is called "A Fragment—On Glenriddell's Fox Breaking His Chain." There is liveliness in it and point to its satire, and it may well be included in future complete editions of Burns's works. Mr. Bright has done his editorial work with entire skill, discretion, and modesty.

—The *Saturday Review* has recently noticed Dr. Bastian's last experiments favorably; but the incompleteness of his induction of the death-point of bacterial germs will appear from the following considerations. Professor Wyman, having many years ago repeated the original experiments of Pasteur, arrived at the conclusion, as the result of his investigations, that one of two generalizations in biology must be given up: namely, the doctrine that all living beings are derived from germs, or the doctrine that all germs are destroyed by a wet heat of about 150 degrees Fahrenheit, and that direct inductive evidence was not sufficient for deciding which of these two propositions must be considered limited in its generality. There can be little question, however, that on general deductive or philosophical grounds, such as have doubtless determined the scepticism of Dr. Bastian's critics, the eminent experimenter would not have hesitated as to which of the two doctrines he would limit as to its universality. The temperature at which life is destroyed is one of a class of empirical facts which would not be likely to have the precise generality which belongs to the other principle—*omne vivum ex ovo*—which Professor Huxley has claimed to be positively settled in biological science. And there are deductive physical reasons for believing that the action of heat on minute organic bodies, like those of infusoria, is not so disorganizing as upon larger organic bodies; so that it is possible that the germs, although paralyzed and injured by a heat necessarily less of course than that which would alter the chemical properties of the infusion itself, might yet so far retain life that their vigor might be more or less recovered under favorable circumstances. Dr. Bastian's attempt, therefore, to submit the question of the death-point to a test experiment might have been objected to before the experiment was tried, as not ensuring these favorable circumstances, since the mineral salts in which the uninjured germs of bacteria will flourish may be unfavorable to the development of the paralyzed or partially disorganized ones; as is indeed indicated by the fact that the "test-fluids" were chosen because in them life does not arise without inoculation or the introduction of vigorous germs. In fact, it seems obvious that there is a perfectly legitimate hypothesis in this matter of which no experimental tests can be made. All that is undoubtedly proved is that bacteria, when subjected to a temperature of 140 to 160 degrees Fahrenheit, are so far injured as to be unable to recover upon such poor hospital-fare as Dr. Bastian's test-fluids; *ergo, id est non demonstrandum*, and the position taken by Professor Wyman is still valid.

## EDGAR ALLAN POE.*

IT is indicative of a renewal of interest in the character of Poe that nearly simultaneous biographies should be published on both sides of the Atlantic whose chief if not entire object is to clear his name from the aspersions thrown on it by the misstatements of Griswold, self-appointed foster-father of all new-born American genius. In this they are both and singly successful, Mr. Stoddard in his brief memoir doing summary justice to the detractions, without at the same time hiding from himself the real faults of the man or seeking to throw a false light on his personal character. Mr. Ingram, on the contrary, apparently regarding himself as the sole and appointed restorer of a reputation which he considers Poe's countrymen and the world at large to have set themselves to tarnish, whitewashes him so completely that his American friends would hardly know him. He contemptu-

* 'Works of Edgar Allan Poe. Edited by John H. Ingram.' 4 vols. Edinburgh A. & C. Black.
'Poems of Edgar Allan Poe, with an Original Memoir by R. H. Stoddard.' New York: W. J. Widdleton. 1875.

ously ignores every story that tends to the discredit of his hero, and loses no opportunity to manifest his sense of American unworthiness of so great a fortune as to be the birthplace of his Magnus Apollo. Not content with proving (no more convincingly, however, than Mr. Stoddard) that Griswold was a slanderer, he tries to trace every rumor discreditable to Poe to the same or similar sources. Alluding to the verdict of the court-martial which dismissed him from West Point, Mr. Ingram, with a total misapprehension of all the bearings of the case (pardonable, perhaps, in an Englishman who dislikes America, and rather prefers to show that he does), says: "In the grandiloquent style of the Academy officials, he was 'dismissed the service of the United States'! Better for him, poor fellow, and better for the credit of his countrymen, if he had then and there accepted the fiat of the Academy officials as that of his nation, and sought on some foreign shore the hospitality denied him by his own countrymen." But why "grandiloquent"? Having been tried by court-martial and pleaded guilty to all the charges, and being, while a pupil of the Academy, in the service and under the pay of the United States, what simpler English could have been employed than "dismissed the service of the United States"? And why "accept the fiat of the Academy officials as that of his nation, etc."? What earthly connection is there between his dismissal from the Military Academy, of which he was a most discreditable pupil, *as pupil*, and exile from his native land? But why exile at all? Poe was received by his countrymen with all the fervor and enthusiasm an ordinate ambition could ask; he had plenty of work if he would do it, plenty of friends whom he took no pains to keep. He quarrelled with every one who had a less indiscriminate admiration of him than Mr. Ingram has; was adopted by a wealthy man, whose money he wasted at wine and cards, and whose affection he alienated by all sorts of misconduct, and who finally forbade him his house. He attacked every literary man of eminence greater than his own with virulent and senseless abuse, and, though poor, had that sublime contempt for earning money which Mr. Ingram would call philosophic, perhaps, but which common-sense people in America call shiftlessness. But will Mr. Ingram assure us that his treatment by his countrymen was worse than that of Keats, Shelley, Byron, or many others whom he better than we can name, by theirs?

Mr. Ingram sneers at the cadets at West Point because they received with "ridicule" a volume of Poe's poems which was not at all what he had promised them, and which even in its present shape contains much sheer rubbish. Mr. Stoddard shows that this was a volume published by subscription of the cadets, at two dollars and fifty cents—an enormous price in those days, and which they "paid in advance almost to a man." "When the volume appeared, they were disgusted with it. It was a penny volume, of about fifty pages, bound in boards, and badly printed on coarse paper, and, worse than all, it contained not one of the squibs and satires upon which his reputation had been built up. Few of the poems contained in that collection now appear in any of the editions of his works, and such as have been preserved have been very much altered for the better" (letter from Maj. Boynton, West Point). But here Mr. Stoddard, in common with his English colleague, fails to see that what the cadets wanted in the book was just exactly what Poe left out and what they had been interested in him for. They hardly cared, we may naturally conclude, for sentimental efforts of any kind, and were scarcely to be expected to perceive the promise in these crude efforts, which, like others more celebrated, would have escaped even Mr. Ingram's eyes had Poe not lived to write the "Raven."

In explanation of Poe's separation from his adopted father, Mr. Ingram merely says that they had "a violent quarrel." Stoddard says: "It is in the recollection of the lady who was his playmate in childhood that he insisted on seeing Mr. Allan, who was confined to his bed by illness, and that Mrs. Allan, not being willing to risk the scene that was likely to have ensued, refused him admittance to her husband's room. This excited his wrath, and he broke forth into invectives against her of a nature so insulting that it became necessary Mr. Allan should know of them, and that he should be forbidden the house." Ingram says of the prize award for the "Saturday Visitor" tales: "Some well-known literary men consented to adjudicate, . . . and, after a careful consideration of the various contributions, decided unanimously that Poe was entitled to both premiums." Stoddard says: "The elegance of his penmanship tempted one of the committee who was to make the award to read several pages of the MS. volume in which these sketches were written. He was interested in them, as were also the others, so much so that they decided to read no more of the manuscripts, but to give the prizes to 'the first of geniuses who had written legibly'"—which is substantially Griswold's account. This Mr. Ingram denies circumstantially, and asserts that two of the committee surviving denied the story; but his extreme carelessness throughout in quoting authorities, and strong bias against every statement which opposes his notion of Poe, make it impossible to accord the credit which he does to the favorable version, where there are two, of the same event.

Mr. Ingram again explains Poe's critical malignity and the ill-feeling it excited as "the dauntless intrepidity with which he assailed the fragile reputation of the small book-makers," while his associate in one of his literary undertakings, the English Burton, writes to him on the subject: "You must, my dear sir, get rid of your avowed ill-feelings towards your brother authors. . . . You say the people love havoc; I think they love justice." As to his critical justice, Mr. Ingram does not leave us to infer it when he tells us that in his "Literati" he assigned the highest position to Mrs. Osgood!

Mr. Ingram denies persistently that Poe was addicted to intoxication from his academical days—considering this only as the failing of his "lonesome latter years." Mr. Stoddard quotes Mrs. Allan as saying to a visitor in the family: "Mr. Gilliet, what *do* you think of Edgar? His father has just paid an enormous sum for his debts in Charlotteville, and now here is a bill for quantities of champagne and seventeen broadcloth coats, which he has gambled away." "Yes," answered Edgar, "I went to see how much of the old man's money I could spend, and I have done it." "The university was then a most dissolute place, and Mr. Edgar A. Poe was remarked as the most dissolute and dissipated youth in the university," writes one of the most friendly of his biographers, though this is partially contradicted by a fellow-student writing nearly thirty years later. "At West Point," according to Mr. Stoddard, "instead of his boyish drink, champagne, he drank brandy, and his room was seldom without a bottle of the best that could be smuggled in. It shattered his nerves and made him appear much older than he was."

The picture which we must draw even from the conflict of testimonies does not justify Poe's English biographer in inveighing against the Americans for not doing for him what it was quite impossible for any one to do. If his vices were genial ones, they were still those which necessarily entail the greatest hardships on the individual and leave their curses on his own shoulders. Neither England nor America could have made him a happy man. The final scenes of his tragic life are by Mr. Ingram wrapped up in a mystery which becomes the friend more than the biographer. Mr. Stoddard has taken the pains to investigate all the particulars, and we learn from him that on a journey preparatory to being married to his early love, he got intoxicated at Baltimore, and, wandering in the streets on the eve of an election, was drugged by election agents, used next day as a repeater, and then picked up senseless and carried to a hospital, where he died four days after leaving Richmond. His wretched life and still more wretched death were not owing to want of friends or want of appreciation; for, unlike the illustrious Joaquin Miller, he did not need to go to England to find his place in the world of letters.

Of the selections which follow both memoirs much need not be said. Some of the poems are silly enough, and much of the prose of the English edition would have been omitted by an editor considerate of his author's reputation. Such stuff as "The Oval Portrait," "The Island of the Fay," and some others, can but diminish the fame of the author of "The Gold-bug" and "The Descent into the Maelstrom."

## SMITH'S ASSYRIAN DISCOVERIES.*

THE ordinary reading public knows nothing more of George Smith than that he discovered, and translated two years ago, the Deluge Myth of the Babylonians. Oriental scholars know him not so much by this lucky find as by his association, as the successor of Edwin Norris, in editing the British Museum series of Cuneiform inscriptions, as the collector and translator in a quarto volume of 'The Annals of Assurbanipal,' and as the author of numerous papers on Assyriology in English and German-Oriental publications. They know him as one who, from his employment in the British Museum, has had exceptional advantages for the study of Assyrian texts, and as one of the most fluent translators of them. His limitations come from his lack of philological training. Col. Rawlinson commenced his study of Assyrian with the advantage of familiarity gained in the East with other languages. Mr. Smith, a man without liberal culture, commencing his philological study with Assyrian, has almost by intuition gained a knowledge of that language. But he has not been able to help himself as he needs by the flood of light which the Hebrew, Chaldee, Syriac, and Arabic, and, we suspect, the Ethiopic, might throw upon it. This was the weakness of Dr. Norris, whose Assyrian dictionary is constant evidence

* 'Assyrian Discoveries: an Account of Explorations and Discoveries on the Site of Nineveh, during 1873 and 1874. By George Smith.' With illustrations. New York: Scribner, Armstrong & Co.

that he was not master even of the Hebrew or Syriac information which he gleaned from Gesenius's or Castell's Lexicon. We are hopeful that A. H. Sayce in England and E. C. Schrader in Germany are the *avant-courriers*, though scarcely more than that, of a new and more philosophical school of Assyriologists. Great credit thus far is due to Oppert and Menant in France, and to Rawlinson, Hincks, Norris, and Fox Talbot in England, who by unguided and unchecked enthusiasm have laid the foundation and so much of the superstructure of Assyriology. These men, with their no less laborious disciples, Sayce, Smith, Schrader, and the singularly fertile Lenormant, have achieved wonders ; but thus far not one accomplished Semitic scholar has attacked Assyrian, the most interesting of its family, unless that shall prove true of the son of Dr. Delitzsch, whose opening lexicographical studies are extremely promising.

The present volume is the work of one who is simply a translator, and is valuable only for its translations. Mr. Smith doubtless is a successful explorer, but he has no skill in telling of his explorations. We imagine that he made no great impression as a correspondent of the London *Telegraph*, which sent him on his first expedition. In this respect this volume is far inferior to the similar works of Loftus, Rich, or Layard, while on the other hand it lacks the labored learning of Oppert's 'Expédition scientifique en Mésopotamie.' Apparently aware of his weakness as a narrator, the author modestly cuts the story of his excavations as short as possible, and devotes most of the volume to what doubtless most interested him—the translation of the texts which he discovered or completed. We must add that he evidently performed his explorations much better than he has narrated them. Mr. Smith is the first explorer who knew precisely what to seek, where to look for it, and when he had found it. He went, not for bas-reliefs or statues, but for records ; not for art, but for literature. He therefore opened no new palaces, though plenty of such there are, but first of all the ancient library of Assurbanipal in the palace of Sennacherib, a portion of whose *lateres coctiles* were the best spoil which Layard brought from Nineveh. Some thousands more of the broken clay leaves of this magnificent royal library Mr. Smith was able to secure in the brief period of his excavations, completing some important texts, of which Layard had secured a part, and filling up important gaps in our knowledge of Assyrian and Babylonian history.

We wish that Mr. Smith had indicated more conspicuously to the eye what is new and what is old in the texts which he has translated. In December of 1872 he published a translation of his Deluge Tablet as far as then known to him. More of it he has since discovered, and has added considerably to other parts of the epic of which this is a fragment ; all of which, old and new, is here given, with no indication of the new portions. The same is true of a principal text of 'Assurbanipal,' which he first published in 1871. Just how much is new can be learned only by laborious comparison with his previous publications and with such extremely valuable works as Menant's 'Annales des Rois d'Assyrie,' published last year, and the same author's 'Babylone et la Chaldée,' published a few weeks ago.

The inscriptions translated by Mr. Smith are almost exclusively either historical or mythological. The only exceptions worth mentioning are a few lines on astronomical observations, and a few excellent moral reflections for kings, reminding them that

> "When, according to the laws of his country, the king does not speak,
> The God Hea, lord of destiny, shall utter his fate, and he shall be set aside."

Menant, in the last volume above-cited, can mention but one king of Babylon before Hammurabi, who reigned about 1500 B.C. A new tablet of Smith's contains the genealogy of six kings who probably reigned prior to 2000 B.C., and is of interest as indicating the worship at this early period of nearly the whole of the later Babylonian Pantheon. We wish that in speaking of this inscription of Agukak-rimi Mr. Smith had told us why he reads "Agu" instead of "Sin." There are about ten very early Chaldean kings in whose names this element occurs, being the name of a god which Mr. Smith has hitherto read "Sin," as does Menant in a volume published since this of Smith's. Another gap just before the Assyrian conquest of Babylon, about 1270 B.C., is filled by two new kings. Turning from Babylon to Assyria, we have given a very important new inscription of eighty lines, belonging to the age of Bin-nirari, 1320 B.C., or Vul-nirari, as Smith calls him, for he seems unreasonably slow to accept Lenormant's determination of the name of the god who forms the first element in the name of this king. We had hitherto known only the bare names of this king and his three immediate predecessors. The inscription shows us Assyria as at this date the leading power in Western Asia, and the conqueror of numerous neighboring peoples, including the strongest tribe in Babylonia. Mr. Smith occupies a large space with the annals of Tiglath Pileser II. Although these badly-mutilated records include the very important names of Azariah and Ahaz, kings of Judah, and Menahem, Pekah, and Hoshea, kings of Israel, we cannot say that much has been added of interest. The new fragments do not relate to Palestinian or Assyrian invasions, and these names have been carefully studied. Here a curious fact may be noted. The English scholars appear to agree with Mr. Smith in recognizing the name of Azariah, while the French scholars are unanimous in making the Asriahu of the inscription to be the son of Tabeel, whose name is not given in the Jewish Scriptures. The new inscriptions of Sargon add very little of importance to what was already known of him, and the same may be said of the long inscription of Sennacherib. The two inscriptions of Esarhaddon are, we believe, entirely new. It was known before—chiefly from the titles assumed by this king—that he had carried on a campaign in Egypt. Considerable particulars of this campaign are here given. Sixty pages are then allowed to his son Assurbanipal's annals, as given in "Cylinder A." But we find on comparison of this text with the two volumes in which it has previously been published by Mr. Smith (one of them a very cheap and accessible book) that the changes are very slight and the additions insignificant. We notice that Urdamane, king of Egypt, son of Sabaco, is here always misprinted "Undamane." A new portion of "Cylinder C" is given, but it adds nothing to history. This brings us very near to the close of the Assyrian monarchy. Who Assurbanipal's successor was is not certainly known. It has been hitherto supposed to have been an inconspicuous Assur-edil-ili, but Mr. Smith has discovered one Bel-zakir-iskun, whose inscription, however, is of no importance. There are a few inscriptions of a later period, including several of a Persian or Parthian date, one of which is important as fixing the beginning of the Parthian era in 248 B.C.

Even more important than these historical monuments are the mythological tablets. Mr. Smith seems bound to make the most of his own spoils in the East, and they were considerable, but the bulk of his mythological texts, while new to the public, have long lain untranslated in the British Museum. The new portion by which he now completes the story of the Flood is very short and of no special interest. We have, however, for the first time a translation of all that has been found in the Epos of Izdubar. Our first interest in it was to discover whether or not it substantiates Rawlinson's conjecture (*Athenæum*, Dec. 7, 1872), that its twelve books would be found to correspond appropriately to the twelve months, and that the legend is thus a solar myth representing the passage of the sun through the Zodiac. Mr. Smith says that the narrative plainly contradicts such a theory ; and though so good an Assyrian scholar as Mr. Sayce has very lately attempted to controvert Mr. Smith on this point, it appears to us to have been on insufficient grounds. Only two tablets, the sixth and the eleventh, show any clear parallelism with the corresponding months. The sixth tablet recounts the unsuccessful suit of Ishtar or Venus, and the sixth month had the symbolic name of the "month of the revenge of Ishtar," while Ishtar, under the form of an archer (Sagittarius), is the sixth sign of the Zodiac. No less exact is the correspondence of the eleventh month, that of Aquarius, generally represented by a vase out of which water is passing, with the eleventh tablet, which contains the story of the Flood. The other tablets show no correspondence. The story of the conquest over the winged bull, which Lenormant, following Rawlinson, referred to the second month, which has Taurus for its sign, turns out to be a part of the Ishtar story in the sixth book. It is true that Mr. Sayce finds the ninth month, that of "the rainy cloud," paralleled in the visit to the region where the giants attend the morning sun ; but the story contains no indication that this was in "cloud land." Indeed, it is only "the mountains of Mas" that are mentioned as the scene of this adventure, which occupies about half of the canto or tablet, although the other cantos, as far as we have them, give no suggestion of the corresponding zodiacal signs or of the symbolic names of the months. It must be remembered that the story is imperfect, and there may be some slighter solar idea running through the legend. It is certain that it is in the eighth tablet (the eighth month being October and November) that Izdubar is stricken with disease, which is very appropriate if Izdubar is the sun ; and that it is not till the last tablet, corresponding numerically to February, that he gains the gift of immortality. This might well be a solar fable ; but as only two of the twelve tablets can well be compared with the symbolic names of the months, or with their zodiacal signs, we must conclude that the evidence has rather weakened than strengthened since Rawlinson propounded the hypothesis.

To all readers a principal question of interest in Assyrian discoveries is whether or not they confirm the Biblical narratives. Of the historical portions, the confirmation has been remarkable, bringing out into bold relief

kings perhaps incidentally mentioned a single time, and otherwise unknown, or giving independent accounts of their campaigns. The Babylonian legend of the Flood has been triumphantly hailed as wonderfully corroborating an earlier portion of Scripture. Of this we are not quite so sure. This cuneiform legend is nearly or quite as old as the time of Abraham. But its form is purely fabulous, and it is *prima facie* not improbable that this polytheistic legend, brought from Ur of the Chaldees by the Abrahamidæ, was purified by them to accommodate their monotheistic faith. Were it allowed that a solar myth was at the bottom of the story of Izdubar, that would pretty much remove the chance of the Flood's being historical. But before we can come to any safe conclusions, we shall need to make a more careful study of the yet unpublished Babylonian mythology. The discovery of a cuneiform version of the story of the Tower of Babel is announced, and there is every reason to hope that nearly the entire cosmogony of the first nine chapters of Genesis may yet be paralleled from corresponding tablets of Sumir and Accad.

*A Synoptical History of England*, with the Contemporaneous Sovereigns and Events of General History, from the Earliest Records to the Present Time. By Llewellyn C. Burt, Barrister-at-Law. Second edition. (London : Lockwood & Co.)—This compendium of English history will be found extremely useful, as well for teachers as for private readers. Each page of the history is arranged in three columns; the first contains a brief chronicle of events, the second fuller details upon the most important points, the third the events of contemporary history. No reign after the "Octarchy"—even Edward the Martyr and Edward V.—occupies less than one page, and in the earlier periods few reigns overrun a page ; later reigns are of course much fuller. There are many excellent genealogical tables, two good maps (of Britain under the Romans and England under the Saxons), copious lists of eminent characters, and extended general remarks upon government, literature, manners, and customs, etc., interspersed at appropriate points. The last instalment of these, "Remarks upon the Hanoverian Line," contains a large amount of most convenient information, such as the national debt, the British possessions, education, etc. There are also tables of important battles, treaties, statutes, etc. It is to be regretted that Mr. Burt's health prevented his attending to this part in person, as it is to be feared that all the details are not brought down to date ; for instance, there is no statement of the new Supreme Court of Judicature established year before last.

The detail is, in general, excellent. In the table of sovereigns, pp. 32, 33, the most important facts regarding each are given summarily ; it would have been well to add the day of the month of the accession of each—a point of a good deal of importance for the dates of statutes. "Æneas Sylvius, Pope," p. 58, might as well have added to it "Pius II." It would have been well to have given the substance (p. 73) of the celebrated statute of the forty-second Elizabeth, "which formed the Poor Law of England and Wales." The affair of Dec. 6, 1648, is told (p. 81), but its familiar name of "Pride's Purge" is omitted. On the same page the Marquis of Montrose is twice called "Duke." The bestowal of the Duchy of Austria upon Henry Jasomirgott is given (p. 37) as 1153 instead of 1156. Louis X. of France is called Louis V. (p. 47). Count Thurn is called (p. 76) Thurm. It is said (p. 77) that the Council of Dort "condemns Arminius"—who died nine years before ; on the same page New Amsterdam is said to have been founded in 1624 instead of 1613. In the excellent "Table Illustrating the War of the Spanish Succession" (p. 137), it ought to be added that the elder daughter of Philip III. (usually known as Anne of Austria) married Louis XIII.

*Goethe's Hermann und Dorothea.* Edited, with an introduction, commentary, etc., by James Morgan Hart. (New York : G. P. Putnam's Sons.)—In our recent notice of Mr. Hart's 'German Universities,' we called attention to his fresh and suggestive remarks on acquiring the German language. Those who, following our advice, have read them, we are sure will confidently commit themselves to his guidance as editor of the Messrs. Putnam's 'German Classics for American Students,' of which the first volume is before us. We have nothing but praise for the form and mechanical appearance of this little book, in which the text, so far as we have compared it, is scrupulously correct, and lacks only quotation-marks in the conversational portions to be above criticism. Nor would we lay too much stress on this point, as to which the editor's judgment is as likely to find favor as our own. Mr. Hart supplies in his introduction all needed information about the circumstances under which the poem was composed ; and his commentary, and glossary of remarkable words and constructions, shed abundant light on the translator's path. This excellent beginning promises well for the series, which we take pleasure in commending to students and instructors.

RECENT PUBLICATIONS:

*Lectures on the Early History of Institutions.*

By SIR HENRY SUMNER MAINE,

Corpus Professor of Jurisprudence in the University of Oxford

8vo, cloth, $3.

*Ancient Law.*

Its Connection with the Early History of Society, and its Relation to Modern Ideas. By Sir Henry Sumner Maine. New edition. 8vo, cloth, uniform with the above. $3.

*AFRICA:*

The History of Explorations and Adventures, as given in the Leading Authorities from Herodotus to Livingstone. By C. H. Jones. With Map and Illustrations. 8vo, $5.

*MISTRESS JUDITH.*

A Cambridgeshire story. By C. C. Fraser-Tytler. With an Illustration. Second edition now ready. 16mo, Leisure Hour Series, $1 25.

*FAR FROM THE MADDING* Crowd. By Thomas Hardy. 16mo, Leisure Hour Series. $1 25.

*A WINTER IN RUSSIA.* By Theophile Gautier. Translated by M. M. Ripley. 12mo, $2.

*THREE ESSAYS ON RELIGION.* By John Stuart Mill. 8vo, $2 50.

HENRY HOLT & CO., New York.

*HARPER'S CATALOGUE.* The attention of those designing to form libraries, or increase their Literary Collections, is respectfully invited to Harper's Catalogue, which comprises a large proportion of the standard and most esteemed works in English Literature—*comprehending over three thousand volumes.*

Librarians who may not have access to a trustworthy guide in forming the true estimate of literary productions, will find this Catalogue especially valuable for reference.

The Catalogue is arranged alphabetically by the authors' names, anonymous works by their titles. The index is arranged by the titles of the books, besides having numerous appropriate heads, each general head being followed by the titles of all works on that subject.

Harper's Catalogue sent by mail on receipt of ten cents.

Address HARPER & BROTHERS, Franklin Square, New York.

*MESSRS. MACMILLAN'S "READER" is occupied this week with Professor Green's 'Short History of the English People'—next page.*

*EPOCHS OF HISTORY*, Vol. V. 'Edward III.' By the Rev. W. Warburton, her Majesty's Inspector of Schools.'

"A model work of its kind."—*N. Y. Tribune.*

Volumes Previously Issued: 'The Era of the Protestant Revolution,' by F. Seebohm ; 'The Crusades,' by Rev. G. W. Cox, author of a 'History of Greece' ; 'The Thirty Years' War,' by Samuel R. Gardiner ; 'The Houses of York and Lancaster,' by James Gardiner.

Volumes in Press: 'The Fall of the Stuarts,' by Edward Hale ; 'The Age of Anne,' by Edward E. Morris ; 'The War of American Independence,' by J. M. Ludlow ; 'The French Revolution and the Wars that came of it,' by B. M. Cordery, author of 'King and Commonwealth.'

Each volume is enriched with maps and a carefully-prepared index. Price per volume, $1.

"This series is worth its weight in gold."—*London Spectator.*

☞ The above sent, post-paid, on receipt of price, when not to be had of local booksellers.

BOSTON: ESTES & LAURIAT, 143 Washington Street (Opp. Old South).

*CASTLE NOWHERE:* Lake-Country Sketches. By Constance Fenimore Woolson. 1 vol. 12mo, $2.

"Since the day when 'The Luck of Roaring Camp' awoke us all to a new sensation, there has been published no book of short stories so fresh in scenery and incident, so indisputably original."—*L. C. M., in N. Y. Tribune.*

*OAKRIDGE:* An Old-Time Story. By J. Emerson Smith. 1 vol. 12mo, $2.

"A work of peculiar character, differing utterly from the ordinary novel of the day, and attractive by reason of its freshness. Two or three love dramas are embodied in the book, containing passages of great dramatic power."—*Literary World.*

GREEN'S SHORT HISTORY OF THE ENGLISH PEOPLE.

One feels in taking up this volume that Mr. Green is the privileged man who arrives with the book that the world has been waiting for.

It is probably the best short history of a nation that has yet been written. Both in the grasp of essentials and the working up of incidents it is singularly happy. It is the work of a critical writer, who, with jealous affection for his country, and for the national type he feels represented in his own mind, conceives the earliest events of his country's civilization as working and preparing for the state of admirable liberty and law under which the modern English character develops.

> Here and here did England help me. How can I help England, say?

is the key-note of the author's intention. He has done so good a work for his country that we understand how the man with the pen may be a better patriot than the man with the sword.

The history is the narrative of a civilization. The author explains his motive in dwelling more fully on thinkers than on warriors, on religious and literary opinion than on conquest, on great reformers rather than on great tyrants, and giving prominence rather to the charter of Runnymede than to the crown of John.

In consonance with this plan, he resumes from time to time the aspect of English enlightenment and letters. The vivid sketches of the successive English literatures, from Geoffrey of Monmouth and Walter de Map, through Chaucer, the Elizabethan poets, Milton, and Dryden, to the moderns, are so many masterpieces, clear as sculpture and sympathetic as painting.

While the studies of literary epochs are brilliant, no less skill is shown in the portraiture of historical characters. We may point with special satisfaction to the superb portrait of Elizabeth, "touching only on the intellectual side the England of her day, while its moral aspects were simply dead to her," as a painting at once grand in analysis and breadth; and to that of the elder Pitt, "the first English orator whose words were a power; not over Parliament only, but over the nation at large." His sketch of the Wesleys and Whitfield, with their propaganda, while it reveals by its excessive prominence the interest of an Oxford man in Oxford heroes, is as powerful, as complete, as well detached from the prejudices of the present, as the fine studies of those more distant apostles, Bunyan, the Puritans, or Wyclif.

The author contrives to avoid every fault. He is never in a hurry, and finds time for the most patient examination of home-life, social interests, and literary achievements, in a duodecimo volume that includes Hengist and Victoria between its covers. The extracts from chronicles, the scraps preserved from great authors, the little speeches and exclamations of famous people which vitalize a story, are apposite and seemingly unstinted, while the selection shows the ripest acquaintance with six hundred years of books. He steers clear, also, of that tendency to epigrammatic generalizing which is the besetment of an author laboring at condensation; and evades with excellent luck the temptation to rhetorical and dramatic writing which have cursed so many recent historians. He speaks like a man of letters and of culture, telling, in the plainest, most forcible words he can think of, a story too grand for adornment.

It may be pointed out that his treatment of American relations with England is distinguished by the highest spirit of impartiality.

No effort seems to have been spared to lend this epitome all the lucidity of a chart of history. It is evident that minute thought has been given to the divisions, the arrangement, the marginal directions, and the type they are printed in, the clear prominence of dates, the heads of chapters, the objects contained in the Chronological Annals, the genealogies, the tables, and the five epochal maps.

Jeffrey attended to the commas and colons in Macaulay's history, and boasted that it left his hands a perfectly punctuated work. This book, by whomsoever dressed into shape, is thorough in the least minutiæ, so that its very typography is helpful.

The 'Short History,' in fine, has accuracy, interest, breadth, and finish. It is eminently readable, admirably compact, supremely practical. It is worthy of England.

## A SHORT HISTORY OF THE ENGLISH PEOPLE. By J. R. Green, M.A., Examiner in the School of Modern History, Oxford. With colored Maps, and Genealogical and Chronological Tables.

"I thank you very much for sending me Mr. Green's book. I have read it with genuine admiration. It bears marks of great ability in many ways There is a vast amount of research, great skill in handling and arranging the facts, a very pleasant and taking style, but chief of all a remarkable grasp of the subject—many-sided as it is in its unity and integrity—which make it a work of real historical genius. I am sure I wish it all the success it deserves; and you are quite at liberty to give my opinion about it to any one who asks it."—*Extract from Letter of W. Stubbs, M.A., Regius Professor of Modern History, Oxford.*

"Mr. Green's book seems to me not only the best English history of its size and plan, but really the most satisfactory of all the histories of England we have, giving the most complete and vivid account of the growth of the English nation, and the development of its literature and its character, as well as of its political institutions. It is singularly fresh, pointed, and lively in style; original and suggestive in its grouping of facts, and withal not less accurate than if it had all the insipidity of Lingard. It is hardly too much to say that it ought to effect a revolution in the way English history is taught in most schools, especially in girls' schools."—*Extract from Letter of James Bryce, D.C.L., Regius Professor of Civil Law, Oxford.*

"I think Mr. Green's 'Short History of the English People' admirably suited for students in the universities, and for the higher classes in schools. The object of the book, that of combining the history of the people with the history of the kingdom, is most successfully carried out, especially in the earlier part. It gives, I think, in the main, a true and accurate picture of the general course of English history. It displays throughout a firm hold on the subject, and a singularly wide range of thought and sympathy. As a composition, too, the book is clear, forcible, and brilliant. It is the most truly original book of the kind that I ever saw."—*Extract from Letter of Edward A. Freeman, D.C.L., LL.D., etc., etc.*

"My wish is to advance the thoughtful and accurate study of English history, and no book that I have seen is so well calculated to do this as Mr. Green's recent work. . . . The very best summary of English history which has yet appeared. . . . The design of the book is excellent, and the execution of it, so far as I have been able to examine it at present, not less so. It ought to be universally adopted in schools and colleges where the teaching of English history is pursued, for it is the only book with which I am acquainted that brings the subject up to modern requirements. The author has carefully availed himself of the best and most trustworthy materials now at the service of the historian."—*Extract from a Letter of Professor Brewer.*

"Rightly taken, the History of England is one of the grandest human stories, and Mr. Green has so taken it that his book should delight the general reader quite as much as it delights the student."—*Extract from Letter of Professor Henry Morley.*

"To say that Mr. Green's book is better than those which have preceded it would be to convey a very inadequate impression of its merits. It stands alone as the one general history of the country for the sake of which all others, if young and old are wise, will be speedily and surely set aside. It is perhaps the highest praise that can be given to it that it is impossible to discover whether it was intended for the young or for the old. The size and general look of the book, its vividness of narration, and its avoidance of abstruse argument, would place it among school books. But its fresh and original views and its general historical power are only to be appreciated by those who have tried their own hand at writing history and who know the enormous difficulties of the task."—*Mr. Samuel R. Gardiner in the Academy.*

"The style is crisp and vigorous, the statements accurate, and the author shows great familiarity with the best literature of the subject. I shall take pleasure in recommending it to my classes."—*Extract from Letter of Professor Arthur M. Wheeler, of Yale College.*

## A PRIMER OF ENGLISH GRAMMAR. By the Rev. Richard Morris, M.A., LL.D., President of the Philological Society of London, author of 'Historical Outlines of English Accidence,' 'Elementary Lessons in Historical English Grammar,' etc. 18mo, cloth, 40 cents; paper cover, 30 cents.

*** Forming the first volume of a New Series of History and Literature Primers, edited by J. R. Green, M.A.

"If all the books in the series of literature primers now publishing by Messrs. Macmillan & Co. prove to be as excellent in their way as the English Grammar, the series will be a valuable one for beginners in learning. . . . When it has been said that this volume of a hundred small pages presents a well-drawn outline of all the more important features which differentiate modern grammar as developed by the aid of comparative philology and scientific analysis of language from the dry-as-dust pages of Smith, Murray, and the rest, all has been said that it is possible to say of so small a book."—*New York World.*

## SOCIAL LIFE IN GREECE. FROM HOMER TO MENANDER. By the Rev. J. P. Mahaffy, M.A., Fellow of Trinity College, Dublin. Crown 8vo, $1 50.

"The whole book will be found well worth reading; the writer's knowledge and intelligence are put to the best of purposes, namely, the discovery of the human heart beneath all the dusty facts exhumed by arid scholarship."—*Atlantic Monthly (April).*

## THE LIFE AND LETTERS OF BISHOP PATTESON. By Miss C. M. Yonge, author of 'The Heir of Redclyffe.' With two Steel Portraits. Third edition. 2 vols. crown 8vo, $5.

"Miss Yonge's book is in one respect a model biography. It is made up almost entirely of Patteson's own letters. Aware that he had left his home for once and for all, his correspondence took the shape of a diary, and as we read on we come to know the man, and to love him almost as if we had seen him."—*Athenæum.*

## THE STORY OF A FELLOW-SOLDIER. Being an Account of the Life and Missionary Labors of the Rt. Rev. John Coleridge Patteson, Bishop of the Melanesian Islands. By Frances Awdry. With six Illustrations. Extra fcap. 8vo, $1 50.

"A first-class story of adventures in a strange land, among strange people, as interesting as a novel, and yet every word true, which will convey some idea of what an honest consecration to God in the missionary work means. Parents will find this an excellent tale to read to the assembled household, old and young."—*The Church Journal.*

## THE STATESMAN'S YEAR-BOOK FOR 1875. A Statistical and Historical Annual of the States of the Civilized World. Hand-book for Politicians and Merchants. By Frederick Martin. (Twelfth Annual Publication.) Revised after Official Returns. Crown 8vo, pp. 756, $3 50.

"The 'Statesman's Year-book' has become one of the institutions of the country. We find no fault in it this year."—*Athenæum.*

*THE NOVEL OF THE SEASON.*

## THE HARBOUR BAR. A Tale of Scottish Life. 12mo, paper, $1.

"Bright, picturesque, and true to life. . . . The story is readable and pleasant from first to last, growing in interest as it proceeds, and everywhere showing that the author is really at home in all the vivid scenes which she describes."—*The Standard (London).*

"It is written with charming simplicity, directness, and pathos, and forms one of those beautiful narratives of Scottish lowly life which ever and anon adorn and glorify human nature."—*Boston Commonwealth.*

"The writer knows the Scotch people, and in handling the characters which belong to the little fishing village, the events are made so consonant with the proper elimination of the story that the scenes become deeply interesting without any apparent attempt at dramatic effect."—*Sunday Times.*

"Upon the working out of Elsie's character the author has expended the more labor, and with good results, too; for rarely in fiction is there to be met with a more perfectly-finished picture of a true-hearted, unselfish woman. . . . The description of the terrible catastrophe of the storm on the Harbour Bar is perfect in its graphic vigor and intensity."—*Morning Post (London).*

## The Week.

TWO committees are to be appointed to investigate the Canal Frauds in this State—one a joint legislative committee, and the other a commission, to be appointed by the Governor. The labors of the former are not looked forward to with a general feeling of confidence that they will be full and impartial, inasmuch as the appointment of the House branch of it is in the hands of Mr. Jeremiah McGuire—the same McGuire who, as the champion of public virtue, made a ferocious onslaught some time ago upon the reputation of the late Ezra Cornell, but who now turns out to be no more nor less than one of the "boys." On the other hand, the Governor's commission will do its work thoroughly; according to the *Tribune*, it is to contain no figure-heads, but young, active, enterprising, fearless, and progressive investigators, who will, we trust, under no circumstances "sell out" to Jarvis Lord. The unanimity of the press on the subject is very remarkable. We believe there is not a single Democratic or Republican newspaper—certainly not one of any weight—that does not support, more or less warmly, Mr. Tilden's attack on the Ring, which is of course creditable, as far as it goes, to the Republican papers, for they see plainly enough the connection between this attack and the Presidential question. An enthusiastic anti-Ring public meeting has been held in Syracuse—one of the headquarters of the Ring—and another is to come off in this city. The *Times*, we notice, though it supports Mr. Tilden, feels obliged to call the attention of the public to the fact that but for the exposure of the Tweed frauds in the columns of that journal in 1871 (which it will be remembered was not made by Mr. Tilden), the avalanche of public sentiment which now makes the destruction of the Canal Ring possible would not be in existence.

---

Speculation is again running riot in Wall Street, and during the week there has been such an outbreak as has not been witnessed for years. The withdrawal from the market on Monday of $5,000,000 gold enabled the gold "clique" to obtain from borrowers as much as one per cent. for one day's use, and also to carry the price of gold up to 117. Of course, the foreign exchanges were immediately unsettled, and foreign trade was embarrassed, and in some departments checked. Any advance in gold interfered with the negotiation of New Fives by the syndicate, and, what is probably much regretted by President Grant, defers the execution of his pet scheme of putting at least one silver coin in the hands of every American citizen. The gold clique at no time made much impression on the money market, and less on the share speculation; Union Pacific stock—the head and front of the "bull movement" in shares—having rapidly advanced, in six successive business days, from 51½ to 68½, the largest advance having been on the day when the gold clique made its demonstration. The extent of that day's business at the Stock Exchange can be judged when it is known that nearly 500,000 shares of various stocks—of the par value of $50,000,000—then changed hands. On the next day there was a reaction, gold and stocks both going down.

---

The general trade of the country has been slowly but surely improving. Of the leading staple products, the price of cotton has been fully maintained; the receipts at the ports continue small. In breadstuffs and provisions there was, early in the week, a slight concession in prices, but no important change in the tone of the markets. The statistics of the hog product for the year 1874–5 have appeared. The number of hogs packed—5,537,124—exceeds any previous year, and, although the average weight is less than in previous years, the market value of the product is surprisingly large, amounting to $96,750,000, or $35,600,000 in excess of the average proceeds of the product for the preceding four years. This $96,750,000 is an item to the credit of Western producers which should be taken into account in estimating the condition of the West as a market for Eastern-made goods. The dry-goods trade has been enlivened by the advent at last of spring weather. In the grocery trade there has been an advance in sugars and a decline in teas. The outlook as to general trade, while as good as could be expected, does not justify the wild speculation at the Stock Exchange. There have been no important failures in any department of trade. Credits are still granted with caution, and collections are good.

---

The adjournment of the Senate without confirming the nomination of Mr. Pardee as Durell's successor is significant of the tendency which the patronage system is taking. We understand that the real reason why he was not confirmed was, not that there were any serious objections to his character or capacity, but that the place was claimed by Senator West as his own property, and that the demand brought to his side the leading Republican senators, who felt that any change in the system would create a dangerous precedent. In connection with this, the nominations made by Grant from among his supporters in the late Congress have an extraordinary look. Lists have appeared in one or two papers of these men, and, as we have not seen the facts disputed anywhere, we must take it for granted that they are correct. We give the most complete we have met with: Godlove S. Orth, Minister to Austria; Horace Maynard, Minister to Turkey; James N. Tyner, Second Assistant Postmaster-General; D. W. Gooch, Pension Agent, Boston; C. C. Sheats, of Alabama, Sixth Auditor Treasury; I. C .Parker, of Missouri, United States Judge Western District of Arkansas; D. P. Lowe, of Kansas, United States Judge for Utah; J. D. Ward, United States District Attorney for Northern District of Illinois; A. J. Ransier, Collector of Internal Revenue, Second District, South Carolina; L. C. Carpenter, Collector of Internal Revenue, Third District, South Carolina; L. A. Sheldon, Assistant Counsel before the *Alabama* Claims Court; Alexander White, of Alabama, counsel to prosecute crimes under Attorney-General; O. P. Snyder, of Arkansas, postmaster at Pine Bluff. All these men supported the Force Bill, and, unless we are greatly mistaken, all of them have been turned out of their places for misconduct by the people.

---

The appointment of Joseph Brooks as postmaster at Little Rock is also a remarkable one in its way, for only a few months ago the President issued a proclamation describing Brooks and his party in Arkansas as "turbulent and disorderly persons," and threatened to call out the troops to take their lives. But the press of course does not know anything about matters of this sort. We have not the slightest doubt that on examination it would be found that Grant's motives were perfectly right; that he was entirely opposed to the nomination of Brooks, and repeatedly so expressed himself in private conversations; but the fact was that Dorsey and Clayton had a right to the place, and Brooks was their man. Grant, therefore, was obliged to yield what politicians call his "individual judgment," of which he seems to have an enormous supply, to what they also call the interests of the party.

---

Negotiations are pending in this city between a Catholic Committee, acting for the parochial schools of the church, and a Committee of the Board of Education, over a proposal, on the part of the former, to have the Catholic schools placed under the Board, and made part of the common-school system, "subject to its laws as regards the course of instruction, the methods of discipline, and the general management," on "such terms as may be agreed upon.' The only terms the Catholic Committee can offer include, neces-

sarily, the reservation to the Catholic clergy of the virtual management of the schools by the selection of the teachers, and the giving of religious instruction as part of the regular school course. If they were not going to insist on these things there would be nothing to negotiate about, and all they would have to do to get their schools into the common-school system would be to hand them over to the Board. The proposed compromise has, it is said, been adopted in other cities "with success," though in what cities we do not know, nor do we know what success can mean except the satisfaction of Catholic claims. People who suppose the satisfaction of these claims can mean anything short of the destruction of the common-school system deceive themselves. They must remember, first of all, that after we have given the priests the control of Catholic schools, we shall have only given them a part of what they conceive to be their due. They hold themselves entitled as of right, and solemnly proclaim it, to the control of the education of children of all denominations in every country. Their willingness now to share it with the Protestants in this country is simply a concession to the force of circumstances, which in no way releases them from the obligation of extending the limits of their jurisdiction by every means in their power; and it behooves those who negotiate with either cardinal, archbishop, or vicar-general to remember that they negotiate with a person who cannot bind himself on subjects of this sort by human conventions. A secret order from Rome may any day relieve him from any stipulation whatever which may seem prejudicial to the interests of the church.

---

In the second place, it is folly to suppose that after the Catholics have been allowed to withdraw their share of the school-tax from the common fund, or—which is the same thing—been allowed to place their own schools under the Board of Education, other denominations will long remain satisfied with the present system; all religious denominations would like to educate their own children in their own way, if they could get the state to raise funds for them by taxation. Episcopalians and Methodists and Baptists support the common schools, not as a perfect system, but as the best attainable system; but a large part of its efficiency and the whole of its justice would be gone if it was modified to meet the requirements of one religious sect. Moreover—and here is a consideration which the people of this country must face sooner or later, and they may as well begin to face it now—the education given or superintended by Catholic priests is a bad education; indeed, for political purposes, worse than none. It unfits children for the citizenship of free states. If extended widely enough, it would ruin this Government. It has been tried for ages in various countries, and has in all worked unutterable mischief, and destroyed the sources of national greatness by killing the sincerity, the truthfulness, the courage and high-mindedness on which national greatness is based. The thoughtful and patriotic men of all Catholic countries are to-day getting rid of it as a national curse. And it would be an astounding spectacle if, after the priests had been excluded from the work of public instruction in France, Spain, Italy, and Bavaria, they were to be allowed to carry it on here with taxes voted by American citizens. Compromise with these men has, in short, never succeeded, and never will. The only thing that does succeed with them is their rigorous subjection to the common law.

---

We presume there are very few persons in the United States competent to form any opinion on the subject, who would be prepared to maintain in a private room that the Civil-Rights Bill was constitutional. We regret to make mention of "a private room," but in the existing state of political morals this distinction is necessary. Mr. Carpenter made an argument in the Senate on this point which has never been answered and which it is safe to say is unanswerable, and now the courts are going to work at the Act, and we presume before Congress meets will not have left it worth repealing. Judge Emmons, one of the United States Circuit Court judges, has charged the grand jury at Memphis, Tenn., that Congress cannot give the Federal courts jurisdiction of offences committed by innkeepers and managers of theatres, as such, inasmuch as these persons are wholly controlled in their mode of conducting their business by and owe the privilege of conducting it to the State governments; that the late Amendments to the Constitution have not given the Federal Government jurisdiction of murder, arson, assaults, batteries, trespasses, frauds, injuries to reputation, obstructions to the right of attending church, public schools, or theatres, or of being accommodated in inns. On the contrary, these things were expressly reserved to the States. "The vast mass of civil and political rights," he says, "included in the term, life, liberty, and the pursuit of happiness, rest entirely under State protection." The citizen of the United States, he adds, as such, has no right to go to theatres or hotels, but only the right to pass from State to State on his lawful errands, to protection on the high seas and in foreign countries and a few others. In short, the Amendments have not changed the relations of the States to the General Government. They have simply placed one or two additional restrictions on State legislation.

---

The Illinois Constitution, and probably the constitutions of a good many other States, require that a majority of the directors of every railroad holding a charter from the State shall be citizens of the State. As a matter of fact, however, the greater part of the stock of the Illinois and other Western railroads is owned in the East, and as stockholders, when they are wise, generally elect directors who have some community of interests with them, it turns out that many, if not most, of the roads have a majority of directors who are not citizens of Illinois. The Chicago, Burlington and Quincy directory, as an instance, contains two Illinois directors in a board of thirteen. The only objection to this that we know of is that the non-residents are not as directors personally or criminally amenable to the laws of the State. But as the State can always compel a corporation to do business in accordance with its laws or lose its charter, there does not seem to be much hardship in the case. The only effect, however, of compelling Eastern stockholders to submit the management of their railroad property to citizens of Western States will be to make capital still more shy of Western investments than it is now. While there is in the East no distrust of Western men as such, it is impossible for any one in his senses to shut his eyes to the fact that it is by Western legislatures and through a Western popular agitation that a very serious attack upon capital and property has been made, and that now the chief reliance of people in New York and Boston against attacks of a similar kind is, that they do at least manage their property themselves. The experiment, too, of a "Western" management, in the case of the Chicago, Burlington and Quincy Railroad, has been actually tried, and most egregiously failed. If the West wants any more money, as it certainly does, the best thing it can do is to call off its legislatures and attorney-generals, as Minnesota has so sensibly done, and let the Eastern monopolist alone.

---

Mr. Eugene Lawrence, a voluminous writer for *Harper's Weekly*, had a long and bitter attack on Mr. Schurz a fortnight ago, based on a thoroughly disreputable piece of garbling—that is, he took a passage from Mr. Schurz's speech on the Louisiana question in the Senate, which, detached from the context, meant one thing, and with the context meant exactly the opposite, and used this passage so detached as a basis for his abuse. The performance was so scandalous that Mr. Curtis, the editor, on the following week exposed it in full, and disclaimed all responsibility for it. But then the public and Mr. Schurz have a very good right to ask who is responsible for Mr. Eugene Lawrence, and to demand that the publishers place in authority over him somebody of better judgment and sounder morals if they are going to allow him to write in their columns. He appears to be the victim of a monomania about Roman Catholicism, and to be devoting his powers, such as they are, to exposures of its iniquities, but this makes it all the more incumbent on him to keep a close watch over his own soul, which, judging

from the attack on Mr. Schurz, he has been recently neglecting. We advise him to let the Jesuits run for a brief period, while he is looking into his own spiritual condition.

The case of Jesse Pomeroy, in Massachusetts, is in many respects a curious one. This boy, now under sentence of death for murder, seems to have had a peculiar kind of infanticidal mania, if it may so be called. Pomeroy's great source of pleasure for some time back (he is only about fourteen years old) has been to hack, cut, mutilate, and torture little children. He did this without any other object, it seems, than a love of the infliction of pain, and, being arrested for it, was sent to a reformatory. In the reformatory he behaved well and was released, upon which he returned to his old courses, and very soon had killed one or two of his companions and hidden away their bodies. He now is under sentence of death, and the Governor of the State is besieged with petitions from charitable and public-spirited women, on the one hand to let him hang, and on the other to pardon him. The arguments against hanging are that he is irresponsible; that he commits crimes under an irresistible impulse; and that he should therefore be reformed, not put to death. On the other side, it may be said that the chances are ten to one that in a reformatory he will behave well and be pardoned out, and begin murdering again. It is an exceptional case, and has little or no real bearing on the capital-punishment question in general.

Our correspondent has spoken elsewhere of the effect produced in Prussia by the Papal Encyclical releasing Catholics from all obligation to obey the ecclesiastical laws. The Government promptly responded to it by the introduction of a bill withdrawing the state endowment from all priests and bishops—about $500,000 to each class—who refuse to sign an engagement to obey the law, and this, combined with the transfer of the administration of all ecclesiastical revenues, from whatever source derived, to lay hands, will be a heavy blow to the church, as it takes it unprepared. There is of course a possibility that, with due notice, the clergy might have decided to surrender all claim to pecuniary aid from the state. But Bismarck now does not allow them either time for reflection or freedom of choice, for even if they severed their connection with the state to-morrow, he would still under the law supervise their discharge of their ecclesiastical functions. One of the English papers tries to prove the tyranny of this by supposing similar action on the part of the English Government towards Dr. Chalmers and the Free Church of Scotland; but to make this comparison apt we have to shut out of view the history of the relations of the Catholic Church to the state, and the nature of its government, which are the two most important factors in the problem. It is here, indeed, that all attempts to claim for the Catholic Church the position of other sects before the law break down. No other sect gives the same account of itself, or has the same story to tell of its past.

Messrs. Moody and Sankey, the American revivalists, appear to furnish the principal sensation of English society just now, and they and their methods have furnished subjects for a good deal of religious, social, and psychological speculation to the newspapers both weekly and daily. They have drawn enormous crowds, perhaps the largest ever seen at religious meetings, have been assisted in London by many orthodox ministers, and have generally managed to have one or two peers or other leaders of society on their platforms. The view taken of them of course varies according to the speaker's stand-point. The cultivated, cynical people set them down as wholly mischievous. The Broad Churchmen admit they exert some spiritual influence, but doubt if it is as large as it seems, and whether a great part of their audiences are not drawn by curiosity, and think the widespread eagerness for some spiritual light or guidance which their popularity undoubtedly does reveal, an interesting and touching phenomenon. Part of this popularity seems to be due to a slight element of grotesqueness in their oratory, which throws an air of novelty over religious teaching, and thus delivers it from what in our day does so much to weaken its influence—the deadening monotony of iteration. It is the attempt to escape from this which is introducing so much of what is called "sensation" in the pulpit.

It is no exaggeration to say that the London *Economist* is perhaps the shrewdest and most perspicacious political observer in Europe, and it is, therefore, worthy of notice that it has come round to the view which we have all along taken of the recent action of the French Assembly, and has formally apologized to that body for the reflection which it had previously cast on its sagacity and public spirit, and has cordially approved of the recent constitutional legislation. It has, however, gone further, and pronounced on Marshal MacMahon the following verdict, which readers of this journal will recognize as somewhat familiar:

"Marshal MacMahon is not always so prudent as he might be. Yet his very want of statesmanship, his somewhat blundering communications to the Assembly, his transparent good faith, his strenuous efforts to keep his policy conservative without heedlessly irritating the popular party, render him just the man to try this kind of experiment with the best chance of success. If a more politic statesman were in his place, French suspicion would paralyze him. But of this blunt and not too clever soldier there is no suspicion, though his pertinacious conservatism may excite annoyance. And certainly, if a republic is to be inaugurated which is not to alarm France by its rashness, it is hardly possible that it could be more hopefully inaugurated than under the tutelage of a French soldier who is honestly desirous of keeping on good terms with parliament, while doing all in his power to check innovation and keep revolutionary forces under a strong curb."

In fact, most of the recent criticism of the French Assembly, and of MacMahon too, has been based on the assumption that both of them had a community at their back closely resembling Massachusetts, and that they were trying to cheat out of its republic a people which had enjoyed that form of government for centuries, and had no knowledge of Louis XIV. or of the First Napoleon except what they got from school histories. One of the latest stories circulated illustrative of the political condition of France, is one of a wealthy Parisian, whose instructions to his valet direct him always to inform him, on bringing in his hot water in the morning, under what form of government he is living.

The fact that Mr. Thorold Rogers has taken the field in public against the English Church Establishment shows that its fate begins to occupy seriously the more moderate as well as the more radical and Comtist Liberals. The bishops and archbishops of the church, with two exceptions, have issued an address to the clergy and laity which, though it contains no positive recommendation, shows that alarm about the matter begins to find its way into the highest ecclesiastical circles. Nothing can well be more pointless than the address; for, though it describes a sad state of things in the church, all it has to offer by way of remedy is advice to the clergy to be moderate in their ritualizing, and not to enrage the laity; and to the laity to be patient with the clergy, and bear with a little too much ceremony for the sake of peace; and to both to be good, and if they cannot be good, to be as good as they can. The rule of selection in the making of bishops has so much regard to safeness and the conciliatoriness of the position, that it is useless to look to them at a crisis like the present for any very positive suggestions, and what they now say will probably produce no effect on anybody. Even the *Spectator* denounces it "as a creamy and semi-fluid bread-sauce," and as resembling the Papal Encyclicals in its inflation; but the utterance of it shows that they begin to be alive to the situation. And yet, how little natural sense of it they have was shown in the recent support by the Bishop of Winchester of an ill-conditioned rector's insulting refusal to allow a Methodist minister to attach "Rev." to his name on his daughter's tombstone. The minister has since made preparation to enforce his rights in the courts, and now, after the mischief has been done, and the exasperation caused, the bishop has ordered the rector to yield, and let the Wesleyans put what they please on their tombstones.

## THE CANALS AND CHEAP TRANSPORTATION.

IT is an encouraging sign of the growth of the general intelligence and conscience as to public questions, that Mr. Tilden's attack on the canal peculators is not treated anywhere as a matter of merely local interest. Down to the time of the onslaught upon the Ring in this city in 1871, it was the custom all over the country for politicians, clergymen, lecturers, and even editors who undertook the task of apologizing for the decline in the United States of public honesty and respectability, as indicated by the corrupt condition of things in this city, to salve the matter over by some such gratuitous assumption as that New York was an exceptional place; that it was a large city, and large cities were always corrupt; or that it was not a fair example of the working of American institutions, being really in the hands of "ignorant Irish." The exposure of the Tweed government, however, together with the numerous other exposures at Washington which have followed, have served to convince people that the disease was not local or of foreign importation, or the result of city life, but was a genuine growth of the soil, which exhibited itself in its flower and perfection in New York simply because New York was the great city of the United States, where the social system found its fullest and most complete expression. Comparing the attitude of the press now with its attitude immediately after the exposure of the Tweed frauds, we have very good evidence of the fact that any bold attack on corruption has become an extremely popular move in the political game, and that the public at large has at last come to see that the corrupt administration of the great commercial State of the New World is not a matter for jest or apology, but is of the gravest concern to every citizen of the whole country.

It happens, very fortunately, that the canals of New York are public works in which the whole United States have an interest almost greater than the stake which the city and State have in them. It is easy enough to imagine the city and State getting on quite prosperously without any canals at all; but what the grain-producing regions of the West would do without water-communication (within the limits of the United States) with the Atlantic seaboard it is difficult to say. The canal system of the State, in connection with the Western lakes, forms the great highway from the Western grain-fields to tide-water, and the bulk of the grain coming East depends upon them for transportation. The cheapness of water-transportation as compared with rail makes the canals the great check upon the railroads. So impressed were the Senate Transportation Committee of a year or two ago with this truth, that they recommended the solution of the cheap-transportation question by means of new waterways in other parts of the country. It appears from an official report for 1872 that the canal tonnage during the season of navigation in that year was 6,673,370, while that of the Erie and Central railroads amounted to 9,958,239 for the entire year from October 1, 1871, to September 30, 1872. The tolls collected by the State increased from $844,508 02 in 1826 to $3,027,568 67 in 1873. The corrupt mismanagement of this great system of inland water-communication is of quite as much concern to Illinois or Michigan as it is to New York.

Taking into consideration all these facts with regard to the public works of New York—their national character, their competitive relation to the railroads, their dependence on the Western farmer for maintenance, and their public, anti-monopoly nature—it is obvious that we have in their condition the best possible experimental test of the wisdom of the great political panacea for transportation troubles—*i.e.*, the assumption of the business of transportation by the United States itself, and the appearance of the General Government on the scene as a common carrier. If half a century of government transportation will not settle the question, nothing, we may safely say, ever will.

As to the question of transportation itself, that afforded by the canals is no more satisfactory to the public than that furnished by the railroads. The same complaints are made against each as to excessive charges: the tolls are never low enough, the water is never deep enough. The immediate cause of Mr. Tilden's message was a petition from forwarders and others requesting a reduction of tolls; and tolls cannot be reduced without ruinous loss to the Treasury. There is no fictitious stock, either, on which dividends are to be paid—it is all hard debt and actual annual expenditure of money for repairs; and so we have no need to consider here theories which connect the cost of transportation with the number of stock certificates printed. If tolls cannot be lowered, it is for no other reason than because of wasteful and dishonest expenditure by the very body which undertook to give cheap transportation—the State itself.

As to this, we believe we speak strictly within bounds when we say that there is no form of corruption known or imagined by the mind of man which this experiment in cheap transportation has not been the means of introducing into the government of the State. We will give one or two instances. From Governor Tilden's Message it appears that for a long series of years the usual manner in which contracts have been awarded has been on "unbalanced bids"—that is, bids in which the estimates bear no relation whatever to the work to be done. Now, we know very well what would happen in any private enterprise if contractors put in such bids—if a contractor making proposals for a bridge were to estimate his stone at twenty dollars a yard and his iron at two cents a ton; such bids would be rejected at once as on their face collusive or fraudulent. But what does the State of New York do? Mr. Tilden declares that these bids have been for a long series of years invariably accepted, and he mentions in terms of high approval one of the present Canal Commissioners for having actually rejected them. So that, to begin with, we have the whole system of government transportation resting on the connivance of the canal contracting authorities at systematic fraud. Connivance, however, is no proper description of the real nature of the relation between the State and the contractor. From the evidence taken at Albany in 1868 on canal management, it appears that two of the highest officers of the State, on being asked whether they had received bribes from contractors, declined to answer. One member of the contracting board substantially confessed that he had guilty knowledge of a combination among the contractors to prevent bids being awarded to the lowest bidder; and among other things it was found that, under pretext of aiding in the erection of an "academy," a regular subscription for the auditor of the Canal Department was got up among the "canal men," the money paid over to him, and invested in stocks in his own name.

Now, the Canal Contracting Board and the Canal Commission represent in the matter of State transportation the Executive. With the actual management of the canals the Governor himself has and can have very little to do; and though a governor may now and then, as General Dix did, veto improper canal legislation, or, as Mr. Tilden is now doing, expose the corruption, ordinarily year in and year out executive superintendence must be devolved upon some such executive board; and, as a matter of fact, for more than half a century, though the State has varied the details, the canals have been in the hands of a commission, either appointed or elective. With regard to this branch of the government, the contracts published in the *Tribune* from day to day show how effective State superintendence is at the present moment, while the report of the legislative committee we have already quoted shows precisely the same state of things existing in 1868, when the committee reported "that for a long period of time gross and, in many instances, monstrous frauds have been committed by various individuals and combinations of men against the State in the management of the canals; that the abuses thus practised involved those engaged under the law in permanent construction works and in superintendence and repairs, as well as the trusted functionaries of the State; and that the wrong-doing and corruption which have thus crept into this part of the public administration have rapidly advanced within a few years to colossal dimensions."

Such being the condition of the executive part of the State machinery, which really does the work, it is hardly worth while to look into the legislative and judicial. The care with which the legislature guards the interests of the State, however, may be inferred from a good many things; perhaps from nothing better than that now,

after the exposure, the House put in the hands of the Speaker, an avowed tool of the "canal men," the appointment of a committee of enquiry. But the idea of the legislature of the State being a guardian of the public interest in matters of canal management is not worth discussion. It is a matter of common notoriety that, for a series of years past, legislation for the benefit of contractors has been the cover under which most of the frauds have been carried on. The judiciary, however, are untainted. There is no Barnard or Cardozo on the Court of Appeals; and under legislation recently secured at Albany, the Governor will be able, if he is a reform Governor, to direct the Attorney-General, if he is not on the other side, to bring suits for the recovery of stolen money. But this is rather a cumbrous way of managing the canals; and it need not be supposed, either, that because the Court of Appeals is honest now it will always be so.

There is one thing further to which we must request the attention of the advocates of government transportation—that no one in New York has yet been able to suggest any remedy for these abuses except the sale or lease of a part of the system to some private corporation. Particular men may be punished, but the vast corruption-fund still exists, and so does the legislative and elective machinery for circumventing or getting out of the way honest and capable superintendents or inspectors. Another very noticeable feature of the New York canal system is, that the only really permanent body in it is the Ring. Jarvis Lord was the head of the Ring, or one of the rings, in 1866, and he and Johnson and Belden have been continued in their peculiar offices ever since. These men also "superintend" and "inspect," as "trusted functionaries of the State," their own fraudulent transactions. Lord is a Senator, Johnson an Assemblyman, and so on. In fact, for length and security of tenure, no office in the gift of the people compares with that of the canal-contractor. Ten years ago he was stealing from us, and he is stealing to-day. In a report recently made on the canals to the Chamber of Commerce, by Mr. S. B. Ruggles, it is very justly said that in transportation the "brain" which "directs the action of the machine" and makes the management skilful and economical is a "very important factor," and that the rivals of the canals—the railways—"possess that element in a high degree, in the experience and skill of those who direct their management and use, and their constant and systematic supervision by one common executive head." With the canals the case is different, for the brain which "directs the action of the machine" is the brain of men who live by making the management reckless, wasteful, and fraudulent. Governors and legislators and canal commissioners, and inspectors and superintendents, come and go like the leaves of the forest, but year in and year out the peculator remains at his post, contracting, inspecting, legislating, and pocketing his profits himself, the only permanent part of the system of government transportation in New York.

We have no doubt that this exposure will do a great deal of good or that reforms will be introduced which will be of great benefit. But without a radical change in the system, they can only be temporary. The contract system was introduced, we believe, because the direct operation by the State proved corrupt; and now that the contract system has proved rotten, we are going to try a new kind of State supervision. But we trust that the fifty years of cheap transportation in New York and its results may open the eyes of the public at large to what government transportation really means. What a "double-track, steel-rail, fast-freight air-line" as a Government work from Omaha to the Atlantic really means is not cheap transportation, but wasteful expenditure, decreasing revenues, onerous taxation, widespread fraud, bribed officials, and suspected courts.

## THE CATHOLIC CLERGY AND THE GERMAN GOVERNMENT.

THE controversy which Mr. Gladstone has been carrying on with the Catholic clergy in England, and which may be said to have been closed by his recent rejoinder, if it has done nothing else, has brought out very distinctly two important facts. One is, that no promise or engagement or declaration made or entered into by Catholic bishops with regard to the policy or opinions or beliefs of the church, or with regard to its relations to the state, has any binding force or effect, or possesses any value whatever, as long as it has not received the approval of the Roman Curia. Another is, that whether the dogma of infallibility has been really adopted or not—about which Catholic theologians are divided—there is no means accessible either to clergy or laity of ascertaining whether in any particular case the Pope has spoken infallibly—or, as it is technically called, "ex cathedrâ"—or not. In fact, according to Dr. Newman, there is no problem in theology more difficult than the decision of the precise character of the Pope's utterances, and the only body in the world competent to undertake it is the "Schola Theologorum" at Rome, which attacks it with the aid of a highly artificial and very complex system of interpretation which it takes the study of a lifetime to master. For all practical purposes, therefore, the new powers of the Pope are of little value to the mass of mankind, though their value to the Pope may prove very great. He and the Schola will always know whether he has spoken as the oracle of God, or only as a man, and whether the matter on which he has passed lies within the domain of faith and morals or not; but nobody else will. In fact, he may extend the domain of "faith and morals" in any direction he pleases without let or hindrance, because the public will never know what he is doing until he pleases to tell it. He will thus be able to issue mandates which will cause great confusion among his flock, and which they will consider of divine authority, and afterwards, if their operation does not please him, deny their infallibility. The advantage of this in his conflicts with secular governments does not need to be explained.

Mr. Gladstone has also shown conclusively that the pretence which some of his clerical opponents have put forward, that the Pope no longer arrogates to himself the power of suspending the operation of state laws when he does not approve of them, or believes they infringe upon the prerogatives of the church, is really unfounded. In 1855, the present Pope declared null and void all acts of the Piedmontese Government which *he* considered prejudicial to the church or to religion, and particularly those suppressing the monasteries as civil corporations. In the same year, he annulled the acts of the Spanish Government which provided for the toleration of Protestantism and the secularization of ecclesiastical property. In 1862, he declared null and void the Austrian legislation establishing freedom of the press and of worship and secularized marriage. In these cases, it is true, there were concordats in existence, on the violation of which he might (though he did not) have rested his decrees; but Mr. Gladstone cites three other cases in which there were no concordats, and in which he annulled the legislation of Sardinia, of Mexico, and of New Granada on similar grounds, and shows that by the constitution *Apostolicae Sedis* of 1869 he excommunicates all persons who imprison or prosecute bishops—thus attempting to raise these prelates above the law of their domicile; all who interfere with any ecclesiastical jurisdiction—as, for instance, any one who should sue out a habeas corpus for a priest or monk or nun imprisoned by ecclesiastical authority; all who impede the officers of the Inquisition in the execution of their duties; and all who secularize or purchase church property without the Pope's permission. Moreover, just after the appearance of Mr. Gladstone's pamphlet, the German bishops were thunderstruck by the receipt of an Encyclical, annulling the Falk laws in Germany, which, however, they have not as yet dared to publish in their dioceses, fearing it would increase the rigor of the pursuit with which Bismarck is pressing them.

One has only to state these facts to make apparent the futility of the objections which a portion of the English press is making to the severity of the treatment which the German Government is inflicting on the Catholic clergy. The history of the relations of the Catholic Church with the state everywhere shows that it graduates its pretensions and behavior according to the treatment it receives. A century of repressive and indeed cruel legislation in England

and Ireland made the clergy the most submissive and humble-minded Christians that ever knelt before a throne. They solemnly repudiated before their emancipation Papal supremacy and Papal infallibility in as strong terms as any Protestant could use, and were never tired of proclaiming the indivisibility of their allegiance. In Poland, fifty years of despotism have made one of the proudest prelacies in the world one of the humblest and most patient. In fact, experience has shown that while the church, when exposed to persecution which really assails its freedom of worship, or the peaceable profession of its faith on an equality with other denominations, shows great courage and constancy, it abandons its arrogance and claims to universal dominion, and to jurisdiction over civil rulers, and to the supervision of education, and takes its place quietly by the side of the Methodists and Congregationalists and other sects, before determined resistance on the part of the state; and in that place it can be kept by stern and unremitting watchfulness on the part of the state, but in no other way.

In Germany, it has for ages been allowed to hold the position of an *imperium in imperio*, or, in other words, to retain the practices and powers built up in the Middle Ages, after the state has been completely transformed and modernized. The position of the church in modern Germany was an anomaly with which Bismarck would have been compelled to deal, as one of the features of the old régime, even if the declaration of infallibility had never been made. Its relegation to a position of complete subordination to the state was, in fact, a necessary part of the revolution, and would have been necessary even if the Pope had never enlarged his pretensions, and doubly necessary in a country in which the state claims so great control over the citizen's life as it claims in Prussia. The question for the Germans is not simply a religious one; it is a question whether two sets of functionaries shall be tolerated within the Empire—one obeying orders from a foreign potentate, which may direct him, under the most awful sanctions, to disobey the sovereign to whom he pays his taxes. To apply the term persecution to the solution of such a problem is an abuse of language. What the German Government says to the bishops through recent legislation is substantially this: "I do not care what creed you profess; worship what or how or where you will. I will see that you are protected in doing so. But no German citizen shall be compelled to remain in your communion longer than he pleases; if he chooses to leave you, he shall not suffer for it in mind, body, or estate, but may set up another church if he likes, which in my eyes shall be as sacred and respectable as yours. If any member of your church makes himself amenable to church discipline, the penalties inflicted on him must be purely ecclesiastical—that is, you must not, in seeking to punish him, seek to injure him in his local and political relations. If any priest offends his bishop, you may still fine or rebuke him, or you may fine or imprison him, but not unless the priest chooses to submit; and no penalty of this character may be inflicted until the civil authorities have approved of it, and a priest may always appeal to the local courts when the ecclesiastical courts have not done him justice." The only other point on which the church has complained is the requirement of a university training from the candidates for orders before their entrance to the Catholic divinity-school; but there are two answers to her on this point. In the first place, this requirement is not new. It has already prevailed in Austria and all the rest of Germany, and was enforced in Austria so long ago as the time of Joseph II., and the universities all have Catholic theological chairs, which the bishops control and which the student may attend if he pleases. In fact, this feature in the Falk Laws has been in force in Prussia ever since 1848, and has been applicable to the clergy of all denominations; but since 1855 the Catholic clergy have managed to evade it, so that the recent enactment is only to bring them back to their obedience, under altered circumstances which make that obedience more necessary than ever.

Of the final issue of the struggle there is nothing in the history of the church to cause any doubt. Bismarck cannot reduce the number of Catholic believers, or really invade the domain of conscience, properly so-called, by any legislation he could resort to; but he can compel Catholic priests and laymen to discharge the same duties towards the state as the rest of the community, or to refrain from all acts and omissions which would place them in a different category, politically, from their fellow-citizens; and he asks nothing now which both priests and laymen have not in other countries cheerfully submitted to when they found there was no help for it. There is, in fact, a wide tract of debatable ground in the matter of discipline which the church reserves for purposes of compromise and negotiation, and on which she keeps all she can, but yields what she must. If the state is weak and pliant, she calls God to witness that she needs every inch of it for the proper discharge of her lofty functions, and that she is ready to suffer for it, if need be, as she has suffered in the days of Domitian and Diocletian. But when threats and debates have proved fruitless, and she sees that the police are coming to remove her baggage, she smiles blandly, and declares that the matter is of small consequence, that she has never flourished more than when the clergy had to hide in caves, and the Pope was in jail, and that if the state chooses to be exacting she will resign herself and hope for better days.

## "THE SHORT-HAIRS" AND "THE SWALLOW-TAILS."

THERE is a story afloat that Mr. John Morrissey made his appearance one day during the past week, in Madison Square, in full evening dress, including white gloves and cravat, and bearing a French dictionary under his arm, and that, being questioned by his friends as to the object of this display, he replied that he was going to see Mayor Wickham, and ask him for an office, in the only costume in which such an application would have a chance of success. In other words, he was acting what over in Brooklyn would be called "an allegory," and which was intended to expose in a severe and telling way the Mayor's gross partiality, in the use of his patronage, for the well-dressed and well-educated members of society—a partiality which Mr. Morrissey and his party consider not only unfair but ridiculous. This demonstration, too, was one of the few indications which have as yet met the public eye of a very real division of the Democratic party in this city into two sets of politicians, known familiarly as "Short-Hairs" and "Swallow-Tails"—the former comprising the rank and file of the voters, and the latter "the property-owners and substantial men," who are endeavoring to make Tammany an instrument of reform and to manage the city in the interest of the taxpayers. Mayor Wickham belongs, it is said, to the latter class, and has given, it seems, in the eyes of the former, some proofs of a desire to reserve responsible offices for persons of some pretensions to gentility, and exhibited some disfavor for the selections of the "workers" in the various wards.

But we do not undertake to describe with accuracy the origin or nature of the split—all we know is that the Short-Hairs are disgusted, and that their hostility to the Swallow-Tails is very bitter; and that when Mr. Morrissey proclaimed, in the manner we have described, that a man needed to wear evening dress and to know French in order to get a place, he gave feeble expression to the rage of the masses. They have, too, concocted an arrangement which embodies their idea of a well-administered government, and which consists in compelling the Departments to spend in wages in each district at least $1 50 for each Democratic vote cast, and to apportion the appropriations with strict reference to this rule—the money of course to go to the nominees of Democratic politicians. The plan departs from that of the French national workshops in that it discriminates between laborers, but in other respects it has all the characteristics of well-developed Communism. The way to meet it, according to our venerable contemporary the *Evening Post*, is to have the taxpayers point out to the voters who are to receive the money that they (the taxpayers) cannot well spare it, that they need it for their own use, and that this mode of administering corporate funds is condemned by all the leading writers on government. The Swallow-Tails know so well, however, with what howls of mingled mirth and indignation the Short-Hairs would receive such suggestions that they never make them, but content themselves with confining the distribution of the money to the members of their own division quietly and unostentatiously, as far as lies in their power, which, we candidly confess, we do not think is very far.

It would be doing the Short-Hairs injustice, however, if we allowed the reader to remain under the impression that the unwillingness to have the Swallow-Tails monopolize or even have a share of the offices was peculiar to

them, or that John Morrissey's protest would be unintelligible anywhere out of New York. On the contrary, when he started out with his French dictionary he was giving expression to a feeling which is to be found in greater or less intensity in every State in the Union. The great division of politicians into Short-Hairs and Swallow-Tails is not confined to this city. It is found in every city in the country in which there is much diversity of condition among the inhabitants. Nor did Morrissey mean simply to protest against training as a qualification for the work of administration, as the *Tribune* assumed in a sharp and incisive lecture which it read him the other day. We doubt if any pugilist in his secret heart despises training. He *knows* how much depends on it, and as he is not apt to possess much discriminating power, he is not likely to mark off any particular class of work as not needing it. What the Short-Hairs dislike in the Swallow-Tails is the feeling of personal superiority which they imagine them to entertain, and which they think finds a certain expression in careful dressing and in the possession of certain accomplishments. In fact, the Swallow-Tails whom the New York rough detests and would like to keep out of public life, belong to the class known in Massachusetts as the "White-cravat-and-daily-bath gentlemen," and which is there just as unpopular as here, and has even greater difficulty in getting offices there than here. The line of division in New York is, however, drawn much lower down. The Massachusetts Short-Hair is a man of intelligence, of some education, who wears a plain black négligé and rumpled shirt-front and soft hat, and disregards the condition of his nails, and takes a warm bath occasionally. The New Yorker, on the other hand, wears such clothes as he can get, and only bathes in the hot weather and off the public wharf. If he has good luck and makes money, either in the public service or otherwise, he displays it not in any richness in his toilet or in greater care of his person, but in the splendor of his jewels. One of his first purchases is a diamond-pin, which he sticks in his shirt-front, but he never sees any connection of an æsthetic kind between the linen and the pin, and will wear the latter in a very dirty shirt-front as cheerfully as in a clean one—in fact, more cheerfully, as he has a vague feeling that by showing it he atones for or excuses the condition of the linen. In fact, the Short-Hair view of dress would be found on examination to be, in nearly ninety-nine cases out of a hundred, something of this kind: that the constant care of the person which produces an impression of neatness and appropriateness, and makes a man look "genteel," is the expression of a certain state of mind; that a man would not take so much trouble to make himself look different from the ordinary run of people whom he meets unless he thought himself in some way superior to them, or, in other words, thought himself a "gentleman" and them common fellows, and that he therefore fairly deserves the hatred of those of whom he thus openly parades his contempt.

A New York Short-Hair seldom goes further than this in his speculations, though he doubtless has also a vague idea that a well-dressed man is not so likely to stand by his friends in politics as a more careless one. In New England, as might be expected, however, the popular dislike of that "culte de la personne," as some Frenchman has called it, which distinguishes "the white-cravat-and-daily-bath gentleman," has provided itself with a moral basis. There is there a strong presumption that the Swallow-Tail is a frivolous person, who bestows on his tailoring, and his linen, and his bathing, and his manners the time and attention which the Short-Hair or "plain blunt man" reserves for reflection on the graver concerns of life, and especially on the elevation of his fellow-men, and this presumption a career of philanthropy and the composition of the 'Principia' would not in many minds suffice to overthrow. We believe it is authentic that General Grant never got over the impression produced on him by seeing that Mr. Motley parted his hair in the middle, and it is said—and if not true is not unlikely—that Mr. R. H. Dana's practice of wearing kid gloves told heavily against him in his memorable contest with Butler in the Essex District. We may all remember, too, the gigantic efforts made by Mr. Sumner and others in Congress to have our representatives abroad prohibited from wearing court-dress. What dress they wore was of course, *per se*, a matter of no consequence, provided it was not immodest; the fervor on the subject was due to the deeply rooted feeling that even the amount of care for externals exhibited in putting on an embroidered coat or knee-breeches indicated a light-mindedness against the very appearance of which the minister of a republic ought to guard carefully. It is partly to produce the effect of seriousness of purpose, but mainly to avoid the appearance of airs of social or mental superiority, that nearly all skilful politicians dress with elaborate negligence. In most country districts, no complaints can be made of men in office such as the New York Short-Hair makes against the Swallow-Tail. They fling on their easy-fitting black clothes in a way that leaves them their whole time for the study of public affairs and attention to the wants of their constituents, and at the same time recalls their humble beginnings.

What strikes one, however, as most curious in the controversy between the Short-Hairs and the Swallow-Tails, is the illustration it affords of the rigidity with which every class or grade in civilization treats its own social conventions, whatever they may be, as final, and as having some subtle but necessary connection with morals. When the Indian squats round the tribal pot in his breech-clout, and eats his dinner with his dirty paw, he is fully satisfied that he is as well equipped, both as regards dress and manners, not only as a man need be, but as a man ought to be. The toilette, the chamber, and the dinner-table of a plain New England farmer he treats as wasteful and ridiculous excess, and if good for anything, good only for plunder; and the farmer on the other hand loathes the Indian and his ways and thinks him a filthy beast, and that he (the farmer) has reached the limits of the proper as regards clothes and food and personal habits, and that the city man who puts greater elaboration into his life is a fribble, who is to be pitied, if not despised and distrusted. In short, we can hardly go one step into the controversy without coming on the old question, what are luxuries and what necessities; and, as usual, the majority decides it in the manner that best suits itself. It may be said without exaggeration that the progress of civilization has consisted largely in the raising of what is called "the standard of living," or, in other words, the multiplication of the things deemed necessary for personal comfort, and, as this raising of the standard has always been begun by the few, the many have always fought against it as a sign of selfishness or affectation until they themselves were able to adopt it. The history of the bath furnishes a curious though tolerably familiar illustration of this. The practice of bathing disappeared from Western Europe with the fall of the Roman Empire. The barbarians were themselves dirty fellows, like the Indians, and their descendants remained dirty in spite of the growth of civilization among them, putting their money, like the Short-Hair, mainly into jewels and other ornaments. As long as linen was scarce and dear, changes were of course seldom made, and the odor of even "the best society" was so insupportable that perfumes had to be lavishly used to overcome it. The increased cheapness of linen and more recently of cotton, and the increased facilities for bathing, have in our own day made personal cleanliness a common virtue, but an occasional bath is still as much as is thought, through the greater part of the world, compatible with moral earnestness and high aims. Of late, indeed within the memory of the present generation, persons, mainly belonging to the wealthier class in England, have boldly begun to bathe every day, and they have finally succeeded in establishing the rule that a gentleman is bound to bathe, or "tub," as they call it, every day, and that the usage cannot be persistently neglected without loss of position. Indeed, there are few social casuists in England who would decide, without great hesitation and anxiety, that any English-speaking man was a gentleman who did not take a daily bath. That this view of the matter should be accepted by the great body of those who would rather not bathe every day is not to be expected, nor is it to be wondered at that they should consider it offensive, and that the practice of sponging one's self in cold water every morning should in caucuses be looked on as a disqualification for political life. There is of course a necessary and provoking, though tacit, assumption of superiority in the display of greater cleanliness than other people show, just as there is in coming into a room and finding fault with the closeness of the air in which other people are sitting comfortably. It is tantamount to saying that what is good enough for them is not good enough for you, and they always either openly or secretly resent it.

The popular distrust of the practice of wearing white cravats in the evening may be traced to the same causes. The savage makes no change of toilette for the evening. He dresses for war and religious ceremonies, but he goes to a social reunion or feast in such clothes as he happens to have on when the invitation finds him. The plain man of civilized life, under similar circumstances, puts on a clean shirt and his best suit of clothes. This suit, among the European peasantry, is apt to be of simply the same cut and material as the working suit, or, as it would be called in Brooklyn, "the garb of toil"; among Americans, it is a black suit, like that of a clergyman, and includes a silk cravat, generally black, but permissibly colored. The whole matter is, however, one of pure convention. Now, it has been found of late years a matter of convenience, and of great convenience especially to hard-worked men and men of moderate means, who are exposed to the constant social demands of the great cities of the world, to have a costume in which one can appear on any festive occasion, great or small, which all, gentle or simple, are alike expected to wear, which is neither rich nor gaudy, and in
